VOL. 1—NO. 1. TORONTO, AUGUST 1, 1880 PRICE FIVE CENTS

INTRODUCTORY.

In bringing before the public a new journal, specially devoted to lumbering interests, and incidentally to milling, manufacturing and mining, as being kindred forms of the development of the national industry, there is little apology needed. As there are special branches in trade, so there are special departments in journalism. The daily paper, morning and evening, rushes forth without regard or respect for any interest, but with an intention well formed to treat all fairly; and the result is a little general information here, a little special pleading there, and a large mass of the general gossip concerning things that occur upon the streets or elsewhere, but have very little practical interest for the business man, no matter what may be the branch in which he is engaged.

It is for this reason that specialists in journalism have in many cases achieved such remarkable success. Not to speak of the religious journals, whose existence depends on the zeal of the sects, there are others, such as the *Bullionist*, the *Scientfic American*, the *Grocer*, &c. &c., that represent special interests in trade and science, and they all receive a more or less generous support, from their own class—from those who are interested in the specialties they represent.

Though much attention has been given to the lumbering interests by the press of Canada, yet it is felt that a special organ, which would concentrate the views of those who understand the business, and present them to the public in a way in which they could be fairly discussed, with a full comprehension of the value of the vast interests involved, would not merely serve those who are engaged in the trade, and their employees, but also the country at large. Let it be remembered that the Lumbering interest is the second greatest in Canada—being next to the agricultural. Now, mining, milling and general manufacturing, naturally take a secondary and subservient position, as being dependent on the success and progress of the two great national industries—agriculture and lumbering. In proportion as they prosper, so will be the general prosperity of the country.

It would be out of place in this "Introductory" to enter into details as to the vast resources of Canada as a timber producing country. It has not unfrequently been sneered at as a "wooden country, and the taunt is neither without foundation, nor is it one to be ashamed of. Canada is indeed a wooden country, but its woods are fast disappearing, and one of the prime elements of its early growth, is being ruthlessly destroyed by the old style of management on the part of the government, and the reckless indifference of the people. It will be the duty of the LUMBERMAN to point out the injuries annually inflicted on the wooden wealth of Canada, by reckless tree-felling, and the still more reckless starting of forest fires, whether by sportsmen or settlers. Even in the latter particular, our journal may, by assisting in arousing public opinion, be the means of saving millions of dollars to the country in a single year.

But we are not ignorant of the great responsibility of starting this journal. Devoted as it is to a special class of operators, it must mainly look to them for support. It has not the whole of the reading community to appeal to directly, and hence must depend for success on the earnest and liberal support of those in whose interest it is published. Lumbermen, as a class, are noted for their public spirit and liberality, and we freely trust to their generous support as well as to that of lumber dealers generally. Nothing shall be wanting on our part to make this journal a full and complete record of the lumber business, and all that relates to the trade in Canada. To this end the latest market reports, the contributions of trustworthy correspondents, trade circulars, etc., will be freely used, to give our readers the best, the earliest, and the most reliable information that can be obtained, concerning the important branch of business to which the journal will be especially be devoted; while the mining, the milling, and the manufacturing interests will receive attention proportionate to their great claims on the public.

In short, it will be our endeavour to make the LUMBERMAN worthy of its title in every respect; and, while giving special attention to the great staple industry to which it is devoted, it will also furnish a carefully selected amount of general reading that will make it a welcome visitor in every family.

Advertisers, especially those dealing in mill, mining, and lumbering supplies and machinery, will find the LUMBERMAN a very favourable medium of reaching their customers, as it will circulate among these classes, and receive more attention from them than they have the time or inclination to bestow on a general newspaper.

Watches.

Watches, by reason of their fragile construction, and the variations to which they are liable, can after all only obtain a limited perfection in their performance; therefore, we must not be astonished to find them subject to certain variations. These variations, which are easy to correct, need not prejudice the quality of a watch, as will be proved by the following example. Two watches, we will suppose, have been put to the same time by an excellent regulator. At the end of a month, one of these watches is a quarter of an hour too fast; the other is exactly right to time. To which of these two watches would we give the preference? Perhaps to the one which is exactly right. But in making such a choice, we nevertheless incur the risk of abandoning a good watch for a bad one. The first watch, has, we assume, gained 30 seconds a day; and according to this rate, it has gained a quarter of an hour in 30 days. What must be done to make this watch go well? Alter the regulator inside from fast to slow, or get a careful watchmaker to do it for you, thereby altering its daily rate. Let us now admit that the other watch has been affected during a month by irregular going, which has occasioned it sometimes to gain, at other times to lose to a certain extent daily. It may easily occur that at the end of a month this gaining and losing compensate each other, and by this means the watch indicates the exact hour at the time we look at it. Such a watch can never be relied upon. The fact is that a watch which gains in a regular manner or loses in a regular manner is superior to any whose variation is uncertain, and where its variation comes to be familiar, the little companion may vie with the most delicately adjusted ship's chronometer. A skilful watch-maker one day thus reasoned with a customer who complained of his watch. "You complained," said he, "that your watch gains a minute a month. Well, then, you will congratulate yourself when you have heard me. You are aware that in your watch the balance, which is the regulator, makes five oscillations every second, which is 432,000 a day: so that your watch, exposed to all the vicissitudes which heat and cold occasion it, the varying weight of the air, and the shaking to which it is subjected, has not varied more than a minute a month, or two seconds a day. It has only acquired with each vibration of the balance a variation of the two hundred and sixteen thousandth part of a second. Judge then what must be the extreme perfection of the mechanism of this watch!" A watch cannot go for an indefinite period without being repaired or cleaned. At the expiration of a certain time, the oil dries up, dust accumulates, and wear and tear are the inevitable results to the whole machinery, the functions becoming irregular, and frequently ceasing to act altogether. A person possessing a watch of good quality, and desirous of preserving it as such, should have it cleaned every two years at least. But care should be taken to confide this cleaning or repairing to careful hands; an incapable workman may do great injury to a watch even of the simplest construcion.

The Earth's Population.

In the new issue (No. 6.) of Behm and Wagner's well-known "Bevolkerung der Erde" there are several points of fresh interest. Since the last issue, about two years ago, the population would seem to have been increased by about 17,000,000, the present population of the earth, according to Behm and Wagner, being 1,456,000,000, as against 1,439,000,000 two years ago. This, however, can not be set down to absolute natural increase, much of the addition being, no doubt, the result of new and more accurate statistics. The new issue has, for example, to take account of several new censuses, some of them in countries where the population has not been accurately counted for many years, if at all. We have, for example the census of Spain in 1877; Portugal, 1878; Greece. 1879; Bosnia and Herzegovina, 1879; New Zealand, 1878; Peru, 1876; Denmark, 1880, besides several smaller places. The total population is divided among the continents as follows: Europe, 315,929,000, or at the ratio of 32.5 per square kilometre; Asia, 834,707,000, or 187- per square kilometre; Africa, 205,579,00., or 6.9 per square kilometre; America, 950 495,500, or 2.5 per square kilometre; Aus, tralia and Polynesia, 4,031,000, or 0 4 per square kilometre; the remainder, 82,000, belong to the north polar region, mostly Iceland and Greenland. Although the census of the United States has been taken some months since, and a few of the data oozed out in an irregular fashion, Herren Behm and Wagner have not made any use of the results, wisely preferring to await official statistics. They calculate that the census ought to give a result of at least 47,000,000. The editors have also given a fresh planimetrical calculation of the area of Africa, yielding a result of 29,383,390 square kilometres. Of this area about six and a third milli n are forests and culture land, the same area savannahs and scattered woods, 1,500,000 bush, 4,290,000 steppe, and 10,-500,000 desert. This last item seems appalling, but it should be remembered that much of this desert may be reclaimable, and that it includes large areas of fertile oases. A new p animetric calculation of the area of South America yields the result of 16,732,-128 square kilometres, differing greatly from the sum of the official areas given by the South American governments.

Mr. E. B. Eddy, of Ottawa, Ont., has taken a ten years' lease of the Lovejoy premises in Odgensburg, and will at once transfer them into a match and box factory. While there on Friday he let a contract of the value of $1,200 to put the buildings into proper shape.

In E. C. Cane's mill, Gravenhurst, on Tuesday, Neil McMillen sawed, on one of Goldie & McCullough's machines, 42,600 of 16-inch shingles, within eleven hours. The shingles were jointed by Archibald McKinnon, and Edward Collis packed 32,900.

The Autumn Woods.

AND THE HOUSEHOLD ADORNMENTS WHICH THEY PROVIDE— PREPARING FERNS AND MOSSES.

(Philadelphia Times.)

Ferns become every year more popular for purposes of household decoration. Growing or cut, freshly gathered or pressed, the uses to which they are applied are numberless. It is a safe plan to gather them whenever you can get them, but those who can choose their time to do so usually prefer August or early September, since at this time the ferns are in full maturity and have not yet begun to fade.

In going fern hunting it is wise to take a large book, such as an atlas or a music portfolio, along in which to lay the more delicate specimens as soon as they are gathered; the commoner varieties—such as the ordinary bracken bush, the evergreen fern—may be easily taken home to be pressed, by wrapping them in newspaper with a wet fold around the stems to keep them from wilting. Those which are to be dug up, root and all, for transplanting should be placed as carefully as possible in a basket.

At the close of every excursion the ferns which are to be pressed should without loss of time be transferred to the drying paper. Seated at a convenient table the collector begins her work, her pile of ferns at one side of her and her paper at another. Plenty of paper and two flat, smooth boards are the materials required. Books on the subject advise stout blotting paper, but strong, soft newspapers, such as the *Times* for instance, make an excellent substitute at far less cost. Number one board is laid down; on this several sheets of paper—the more the better if paper is plentiful—and on them the fern is laid out as nearly as possible in the natural position, any twisting into shapes which the fronds would not have assumed in life being avoided. Over it a single sheet of paper is laid, and while with the right hand the plant is being spread out, with the left the paper is being simultaneously smoothed over it, immediately a few more sheets are laid over it and the process repeated with additional specimens until the pile is sufficiently high; then it is topped with the second board and the bundle deposited with a forty or fifty pound weight on the top of all. Bricks make good weights, and they can be so distributed as to make the pressure bear equally on all parts at once; but any weight—a large stone, for instance—will do very well; or you may put the boards under your trunk. If a great many ferns are to be dried, another set of boards and papers may be used, but one is sufficient for quite a number. Next day the collector must "change her papers." The pile is reversed, and the top board laid down on the table, with a sheet or two of dry paper on the top of it. Then the half-limp, flattened fern is carefully transferred to it, and the process repeated until the whole of yesterday's gatherings are once more in dry sheets, and the weights on top of them again. The damp paper is then laid out in the sun or suspended on a cord in the kitchen or other warm place to dry, and in a short time is ready for use. How often the changing of papers must be repeated, depends upon the number of sheets which are interposed between each plant, the state of the weather, the dryness of the room, or the thickness of the fern leaves themselves; but, as a rule, half a dozen times are sufficient, and, if need be, the last two or three times may have an interval of two or even three days between them. If the plants make the paper bulge out, a sheet or two of stout pasteboard interposed here and there will smooth down their asperities and secure better bried specimens. In any case, a little patience and neat-handedness are necessary to secure choice specimens, and the ferns should not be taken out of press until sure that they are well dried. The best test of their being thoroughly dry is to gently bend back a little bit of the frond. If it is inflexible, then it is better to give it another turn of the drying press. If, on the contrary, it breaks, all the sap has been extracted from it by the combined pressure of the stones and the absorbing power of the paper on either side or the specimen. Then transfer them to a large book and keep them there until ready to use them. Small ferns may be pressed between the leaves of a book by tying a string around the volume to keep it tightly shut, but it is important in such case that the ferns should be dry, and the book must be opened and examined from day to day to avoid injury both to the volume and to the ferns.

As already intimated, any one with a large supply of pressed ferns has an almost limitless fund upon which to draw for household decoration. Window transparencies and fire screens are made by framing the ferns, artistically grouped, between two sheets of plate-glass. The side-lights to a hall door may be prettily ornamented in the same way, only for this purpose, in order to obstruct the view, it is well to fasten the fern on fine white net. Bright hued flowers, such as pansies, morning glories, scarlet sage, etc., add much to the beauty of such transparencies and may be successfully dried between sheets of cotton wadding placed between wooden boards.

A cluster of ferns pinned on a lace curtain where it falls apart has a very happy effect, and we have seen pretty window cornices made of a garland of ferns and autumn leaves. The maiden-hair fern looks extremely well arranged in a small basket, with a few dried bits of crimson cock's comb or bachelor's buttons. Indeed, the uses to which they may be applied are limited only by the taste and skill of the decorator.

When a fernery is contemplated the ferns should be carefully dug up and transplanted in soil as nearly as possible like that in which they originally grew.

As a rule, ferns require abundant moisture and cool shade, and the exercise of a little ingenuity will soon provide these requirements for even a varied collection. With the help of a few pieces of furnace slag or other fantastic material, a rockery can be erected in the dreariest city back yard. Sand—not sea, but river sand—should be first strewn over this, and then woods earth should be packed into every crevice where the ferns are to grow.

The newest fern cases have ventilators in the top of the glass, but it is an open question whether these are an advantage in a furnace-heated room.

A very pretty fernery may be made of an old tin tray. Paint it first with waterproof paint, then make a foundation of gravel, charcoal and cinders and some sand, not too much, however. Over this put your woods earth and plant the ferns with sheets of moss, carefully transplanted from the place where the ferns grew, covering the roots. Keep well watered, and you will have a thing of beauty all winter, constantly developing new beauties as tiny ferns and wood plants spring up from the moss.

For decorative purposes moss is scarcely second to ferns, or even flowers. In England it is much used for table decoration, and is gathered in summer and dried for winter use. It is a mistake to think that because moss is green it is of one colour, you will find it of every hue—bronze and emerald, shining, golden and dark purple green. The best way to collect it for decoration is to pull it in large tuits, which should be well shaken after reaching home and spread lightly on newspapers for a day or two, and then again thoroughly shaken, to free them from loose bits and from insects. To keep it for the winter the sprays should be dipped in water, dabbed dry on a cloth, laid flat between two sheets of brown paper and immediately ironed until quite dry. The irons should be of the heat required to smooth linen, but do not prolong the process too much or the moss will become brittle. This process answers for the coarser mosses; more delicate ones should not be ironed, and the "maiden-hair" moss should not be placed in water, or the golden extinguishers may wash off. Small, naturally mossy twigs—ivy, oak leaves, acorns, litchens—by occasionally being put out to be refreshed by rain, can be made to last for some time. The last need an occasional rain soaking, as they become brittle and powdery when too dry. The little gypsy kettles that were so fashionable some years ago may be made into pretty centre-pieces by covering sticks and kettle alike with moss, as follows: Hold one of the sticks in the left hand, take a tuft of moss sufficiently large to wrap around it in the right hand and fold the moss around and over the end of the stick; pass a long piece of fine gardening wire round it, securing the end firmly and pulling it in tight, so that the moss conceals it; wind it round once more and then take a second tuft; let the end neatly overlap the first, and secure it in the same way; continue till the stick is covered, keeping the moss as evenly and tightly rolled as possible. If too shaggy trim it with the scissors. Secure the end of the wire when finished, and if tightly done all will remain firm. The handle of the kettle should be done in the same way before doing the kettle. In covering the latter the upper edge of the tufts should be turned inside, under the tin for holding the flowers, and the first wire tied around close under the top. A very few flowers, arranged in wet sand, will answer for filling the tin. Flower pots may be covered in the same way; and flat strawberry baskets, thus concealed, and lined with white paper, make very pretty fruit dishes. A plateau of moss for holding dessert dishes is also pretty. A board of the desired size and shape is requisite; the edges may be cut out for the dishes to fit into, or they may stand on it. The moss should be made as smooth and even as possible, and may be of only one of various kinds. The common feather-moss is perhaps the best. If liked, a border of gray lichen can surround it, and outside this a second of small leaves, trailing or ground ivy. Borders of leaves and ferns can be made for dishes, and wreaths of periwinkle runners, ivy, holly bright autumn leaves. Ferns can be ironed like the moss and will preserve their colour, but the safest plan is to dry them as directed. Circles or stripes of thin cardboard can be covered with leaves and ferns for surrounding dishes, and single ferns arrangee in a pattern of the cloth. Infinite variety can be made by giving time and thought to the matter.

Porpoise-Shooting.

Porpoise-shooting affords to the Indians of the Passamaquoddy tribe their principal means of support. It is practiced at all seasons of the year, but the fish killed in the Winter are the fattest, and give the largest quantities of oil. The largest-sized porpoises measure about seven feet in length, about the girth five feet, weight 300 pounds and upward, and yield from six to seven gallons of oil. The blubber is about one and one-half inhces thick in Summer, and two inches thick in Winter, at which time the creature is in its best condition. The blubber from a large porpoise weighs about 100 pounds. The Indians try out the oil in a very primative manner, and with very rude but picturesque appliances. The blubber is stripped off, then cut into small pieces, which are placed in a huge iron pot, and melted over a fire. All along the beach were placed, at intervals, curious structures, consisting of two upright pieces of wood surmounted by a cross-piece, from which the pots were hung by chains. Under this cross-piece large stones were piled in a semi-circle, inside of which a fire was made that was allowed to burn fiercely until the stones were at a white heat. The fire was then scattered, and the pots containing the blubber were placed under the stones, and just enough fire under them to insure the melting of the blubber. When melted, the oil was skimmed off into other receptacles, then poured into tin cans of about five gallons, capacity, and the process was complete. If the oil is pure it readily brings 90 cents per gallon, but if adulterated with seal, or any other inferior oil, its value is reduced to 65 cents per gallon. A very superior oil is obtained from the jaw of the porpoise. The jaws are hung up in the sun, and the oil as it drips is caught in cans placed for that purpose. The quantity of oil thus produced is small, being only half a pint from each jaw, but a large price is paid for it by watch-makers and others requiring a very fine lubricator. The oil from the blubber gives a very good light, and was for a long time used in all light-houses on the coast. It is also a capital oil for lubricating machinery, never gets sticky, and is unaffected by cold weather. When pure there is no offensive smell, and I know of no oil equal to it for those who are compelled to use their eyes at night. The light is very soft, and when used in a German student's lamp one can work almost as comfortably as by daylight, and the dreaded glare of gas and other artificial lights is completely avoided. If industrious and favoured with ordinary success, an Indian can kill 150 or 200 porpoises a year, and they will average three gallons of oil each. But, unfortunately, the poor Indians are not so industrious, or only so by fits and starts, or as necessity compels them. Their way is usually to accumulate some 15 or 20 gallons of oil, then go off to Eastport, Me., with it for market. Thus much time is lost in loitering about the towns, and in going and returning from the hunting-grounds. Moreover, there are always two Indians to each canoe, and the proceeds of the hunt have to be divided. There is quite a demand for the oil, and, if systematically followed, porpoise-shooting would afford the Indians a comfortable support. The flesh of the porpoise when cooked is not unlike fresh pork, and at one time was much used. The Indians still use it, and it is also in request by the fishermen on the coast, who readily exchange fresh fish for "porpus" meat with the Indians.

Powerful Ocean Steamships.

[London Times.]

Twenty years ago, the largest steamers known (in this, as in all such comparisons, neglecting the Great Eastern, which was a prodigy of engineering skill), did not reach 350 feet in length, 45 feet in breadth, 3,500 tons in tonnage, or 4,000-horse power indicated. We have, at this moment, before us a list of 50 merchant steamers sailing, in the year 1860, from Southampton and other southern ports, which the largest vessels then frequented, and the list includes but 10 ships of more than 300 feet in length, none of which reached the limits of size and power just given, and the whole of which belonged to two companies, viz., the Royal Mail and the Peninsular and Oriental. At the present moment we have, afloat and at work, the White Star liners, some of them of 445 feet in length, 35 feet in breadth, and nearly 5,000 indicated horse-power; the Inman liners, comprising such ships as the City of Berlin, 488 feet by 44½ feet broad, and of about the same steam power; the Orient, of 445 feet by 45½ feet, with engines developing 5,600 horse-power; the Arizona, of about the same size, with still greater steam power and speed; and many other splendid vessels but little inferior to any of the foregoing. And these grand steamers—many of which reach the quays of New York with greater punctuality than railway trains reach the London suburbs from Victoria and Charing-cross, and would reach our quays with equal punctuality if they could avoid thd abominable sands that bar the Mersey—are the forerunners of still larger and more powerful vessels now taking shape on the banks of the Clyde and elsewhere. The Cunard steel ship, the Servia, now building, by Messrs. Thompson, of Glasgow, is 500 feet by 60 feet, with over 10,000 indicated horse-power, and will, therefore, doubtless possess a speed considerably in advance of that of the very fastest ship at present afloat in the mercantile marine. The Inman steamship City of Rome, building of iron at Barrow, will be still larger, having a length of 546 feet, a breadth of 52 feet, a gross registered tonnage of 8,000, and a steam power nearly equal to that of the Servia. The Guion line is to be increased by ships of almost equal size and power, and the Allan line is building others equal to the finest of the White Star boats. Notwithstanding the number and magnitude of the passenger steamers now running between America and this country the traffic is so great that it has only been possible to secure accommodation by arranging for passage many weeks, and even months, in advance, while the rapidly increasing population and wealth of the United States and of Canada make it certain that the interchange of agricultural produce and manufactured goods between them and ourselves will go on increasing.

Aeronautics.

The proposed attempt to reach the North Pole by balloon has given an impetus to the science of aeronautics in England. A balloon society has been formed, and, under its auspices, several air ships have been sent up in the vicinity of London. One of them contained Mr. Wright, the aeronaut; Commander Cheyne of the royal navy, who proposes to make an experiment with a balloon in his next Arctic journey; Mr. L. C. Alford of Denver, Colorado, and a newspaper correspondent In a minute and a quarter from the start they attained the altitude of 1,000 feet, in three minutes 2,000 feet, and in eight minutes 2,350 feet. The object of the travellers was not to go high, but to get over the ground as quickly as possible, and with a gentle breeze they glided along at the rate of thirty miles an hour. In the descent thay dropped 1,390 feet in a minute and a quarter. They managed to check their rapid fall before reaching *terra firma*, and landed safely after much bumping on the ground. Of the other balloons, one rose 12,000 feet. The scientific observations of the various aeronauts will be carefully compared, and a report made embodying the results obtained as to the air currents at different heights.

An English journal bewails that the world is threatened with a dearth of lions, that the "king of the forest" is gradually disappearing in his native wilds. But this grave misfortune has encouraged a Frenchman to establish a regular breeding stud of lions at Bona, where lions will be bred and brained for the market. Perhaps the royal east will, in the course of time, become so domesticated that the lion and the lamb may lie down together.

FACTS AND FANCIES.

JOHN ROUSE spied a jug under a photographer's wagon at an Illinois fair, conjectured that it held whisky, and so drank fatally of sulphuric acid.

THE municipality of Paris levies a duty on almost everything which enters the city; that of London on scarcely anything but coals, which furnish a large revenue.

TWO boys quarrelled over a game of marbles at Reading, Pa. One cried "Here's one for your head," and threw a big stone, which broke the other's skull and killed him.

THE newest creations among the peers, Messrs. Lowe and Knatchbull Hugessen, having opposed the Disturbance bill and other Ministerial measures, both these pillars of the State are indignantly discarded by their former associates.

SOME Chinamen fitted up boats and made a contract with the canning firms to fish for salmon off British Columbia. The boats drifted empty ashore on the day after, and the Chinamen were never afterwards seen. The white fishermen had murdered them.

THE "fly suffocator," an insect resembling the mosquito, is the latest affliction that has visited the Russian peasantry. Last month, in the Mirgorod district of the Poltava province, 142 head of cattle, 2 horses, 212 sheep, and 173 pigs were killed by it. The flies are said to enter the air passages of the animals and thus suffocate them.

THE following advertisement in the London *Lancet* is scarcely reassuring to the public: "College of Surgeons and Apothecaries. Hall Preliminary Examinations. The dullest and most backward get through. Payments based on results." The prospect of having the "dullest and most backward" hacking away at one is not agreeable.

THE announcement of the formation of ice during the hottest days of last summer in the caves near Zchinval, in the Caucasus, attracted many travellers. It is reported that these caves are filled with ice only during the hottest weather, and that the newly formed ice disappears with the fall of the thermometer. This curious phenomenon greatly puzzles the Caucasians.

"I BEG your pardon, sir," said one of the three men who entered Dovey's store at Mercer's Station, Ky., "but will you please hand me the five hundred dollars out of your safe?" and he politely levelled a revolver. "Sorry to disoblige," Dovey replied, "but there isn't a cent there;" and he affably opened the safe for them to see. The robbers made a thorough search, and withdrew.

THE Russian political inquisition, known under the name of "The Third Section of his Majesty's Own Chancellery," had acquired such odium that the Czar, on recently abolishing it, would not permit the Fourth Section to be styled the third one. By special ukase he ordered that the Fourth Section should henceforth be known simply as "His Majesty's Own Chancellery for the Institutions of the Empress Mary."

THE *Antiquary* says that the largest oak in England is that in the parish of Cowthorpe, west riding of Yorkshire. It is hollow, and some forty men could stand within its trunk. It is believed to be about 1,500 years old. The Cowthorpe oak, which stands on the land of Andrew Montague, a great proprietor, is larger than the Greendale oak at Welbeck. A few years ago the boughs extended sixty feet from the trunk.

A PAIR of lovers at San Francisco could not induce the County Clerk to give them a marriage license, because their ages were only 16 and 15, and their parents objected, being Jewish on one side and Roman Catholic on the other. Therefore the boy and girl gathered a party of their friends as witnesses, joined their own hands, and formally declared themselves husband and wife. The question whether the ceremony was valid is to be tested in court.

BEN ZERCHER was an only son, and his father owned one of the best farms in Belmont County, West Virginia. The old man was past 80. During several years his health had declined, and it was supposed that he would speedily die. Ben was so confident of this that he began to buy stock for the farm, and made other preparations to take possession of the property. But the octogenarian suddenly recovered from his illness, and took to courting a neighbour's daughter. This exasperated the impatient heir, and he shot his father dead, recently.

A STRANGE pagan scene was witnessed in the Volkovo Kladbishche, the largest orthodox cemetery of St. Petersburg. From early morning it was crowded by thousands of men, women, and children. After a solemn requiem by the Metropolitan and clergy, the relatives and friends of the dead treated each other to kutia, or rice boiled with raisins, and drank *in memoriam* vodka, or rye whisky. In half an hour there could be heard not only loud weeping, but singing, swearing, and boisterous laughter.

THE *Saturday Review* says that the number of autumn sojourners in London is increasing every year, and the people who used to live in their back rooms now make no secret of their whereabouts; while as for the male habitues, they may now be found in scores not only among Guardsmen, Government functionaries, or business men, but among those who have no particular tie that binds them to one place more than another, but who are getting sagacious enough to see that they have, on the whole, a better chance of enjoying themselves by maintaining their headquarters in London than by restless flittings to and fro.

A GENTLEMAN in London lately took a bad half sovereign. He asked sundry experts if it might possibly be good, but they were unanimous that it was not; and so he put it away in the corner of his pocket and resigned himself to the loss. But it happened that in the evening he took a cab and drove about to so many places that, feeling for change, he discovered that he had not enough to pay the fare. Forgetting all about the half sovereign being bad, he handed it to the cabman, asked for change, which the man gave him, and then drove off hurriedly. Just then the fare remembered, and, not wishing to "do," the cabby, called out:—"Here! that money is bad!" "It's quite good enough for you!" retorted the man, turning round with a grin. The fare looked at the half crowns, and at once suspected that they were bad, as proved to be the case; but the long drive had been enjoyable, and on the whole the cabby hardly got the best of it.

Buried for Years in a Cavern.

A few days ago Mrssrs. D. E. Doane, W. H. Enfield, and W. W. Blake were surveying and locating the boundaries of the Chihnahuo mine in the Magdalena mountains, about twenty-five miles west of Socorro, where they made a somewhat startling discovery. In chaining down the hill from the centre stake to the west-side line they passed nearly over an opening in the rocks that was about three feet long and fourteen inches wide. A small dead tree about fifteen feet in length was let down into the aperture, and immediately disappeared from view. A young pine tree thirty feet long was then chopped down and a ladder hastily improvised therefrom. Carefully let down, it finally found secure foothold, and two of the party descended into the cavern. By the aid of some lighted pine knots they discovered that they were in the centre of a room about thirty feet square. Continuing their explorations, they found natural tunnels leading to two other but smaller chambers. The ceiling of the main room was fully twelve feet from the floor, In one corner of this room were found the bones of a human being. A portion of the rock overhead had fallen in and buried the greater number of the bones, but one of the collar blades and a bone from the forearm were obtained in excellent state of preservation. Pen can not portray the agony which the solitary occupant of this "dead man's cave" must have endured during his last hours. He could scarcely have been a lone prospector lured to his doom years ago by a fatal curiosity, as no sane man would undertake to explore the cave without first sounding its depths. Besides this, the pioneer of the Magdalens, Mr. J. S. Hutchinson, says that, to his knowledge, no prospector has been missed during the last fourteen years. It is thought that the Apaches, having knowledge of this subterranean prison, must have compelled some unfortunate captive to descend into the eave and tauntingly left him to his fate. How well might the inscription over the entrance to the infernal regions, as recorded in Dante's "Inferno,"

Who enters here leaves hope behind,

be applied to this dismal dungeon. The last chapter of the life of the tenant of this cell would make abundant material for a romance of the border.

ALFONSO makes the Palace hideous by singing "Baby Mine."

THE Czar has become so nervous that a sound of a wash boiler falling down stairs at midnight, will raise him out of bed before it strikes the third stair.

EMINENT PEOPLE.

DR. TANNER lectured at Lawrence, Mass., and took in only $2.75. With his peculiar ideas of gastronomy he ought to live sumptuously on that.

THE Queen of Sweden, who is very ill, has gone to Antwerp to place herself, as her last chance of recovery, in the hands of a celebrated physician.

QUEEN VICTORIA is a poor speaker. She wouldn't draw worth a cent as a lecturer. Her last speech had the effect of dispersing Parliament, to which it was addressed.

THE cruise of Mr. Gladstone, his family and friends, in the Grantully Castle, cost a very large sum of money, the whole of which was defrayed by Mr. Donald Currie, an English merchant, and his partner.

WHEN that baby Princess of Spain grows up and finds how mad everybody was about it, she won't feel greatly flattered. The nearest she can come to it is to wear a Derby hat and bang her hair.

MR. RUPERT KETTLE is about to have greatness unexpectedly thrown upon him, Mr. Gladstone having advised the Queen to grant him knighthood for his tact and energy in preventing many strikes, and his plan of arbitration boards, which have worked so well in the north of England.

MR. FAWCETT, the British Postmaster-General, has a new plan for facilitating the savings of the poor. A saving child may now get an official strip of paper intended to hold twelve stamps, add a stamp at a time to it as he can save a penny, and, when it is full, take it to the postoffice and get a savings bank receipt for a shilling, the minimum deposit which it will pay the Postoffice Savings Bank to take

RECENTLY an American traveller saw on a hotel register the name of "Sir A. T. Galt, and fifteen children." The latter were ushered into the dining-room by their governess, and were mostly fine-looking, well-behaved girls. Britons allude to Americans, in a cynical way, as the people who particularly overdo things. But when it comes to fifteen young *Canadian* girls, it seems to us that it is rather "crowding the mourners."

ABEDDIN PASHA, Minister of Foreign Affairs, presented himself the other day before the Sultan in such a very seedy coat that his Majesty could not refrain from suggesting to him that it was only decent he should put on his best clothes when he was going to see his sovereign. Abeddin replied humbly that he had put on his very best. Whereupon the Sultan directed one of his secretaries to give an order on the Imperial tailor to rig the Pasha out completely. Abeddin accordingly ordered thirty-five coats, thirty-five waistcoats and the same number of every other garment. Since then the mean attire of the functionaries who have been called to the palace has been quite striking, but none of these imitators have as yet excited the Sultan's commiseration.

AN Englishman who knows the Baroness Burdett Coutts well says her vitality and energy are extraordinary. When she is perfectly well she defeats her age by a dozen years. She is a good horsewoman, and is still fond of exercise, and she walks with an elasticity which many a younger woman might envy. Her capacity for business has long been known; and though her benevolence is boundless, no begging impostor could ever hope to outwit her. She has all the shrewdness of the Charity Organization Society, without the callous cynicism which makes that body nothing more than a system of police. Her knowledge of politics and politicians extends over half a century; and as she can write as well as speak with no little grace and force, a book of her recollections should have greater interest than anything of the kind which has been published for many years.

A LATE number of the London *Truth* contains a statement in reference to William H. Vanderbilt and Meissonier, which is quite characteristic of the prompt, decisive way in which the former acts. While painting Mr. Vanderbilt, Meissonier observed: "There is one picture that I really loved, and unhappily it is in Germany. It represented General Dessaix in the middle of a plain, questioning some peasants. It was fine; it was very fine. Petit sold it to a German, a Dresden man, long before the war, for 30,000 francs. I have done everything to get that picture back to France, to ransom it from its captivity in Germany. Petit offered the owner as much as 100,000 francs for it, but he would not sell. I never think of it without a real pang." "Ah!" said Mr. Vanderbilt, beginning to talk of something else. A few days afterward Meissonier went to dine with Vanderbilt. Upon entering the salon there was his Dresden picture facing him upon an easel. "I bought it by telegraph for 150,000 francs," quietly remarked Vanderbilt. "It was a simple enough matter, you perceive, to get the picture."

MR. EDISON is among the prophets once more. He has now perfected the Japanese bamboo for the carbon loop, and in four weeks will have his shops and eight miles of street lamps lighted. He has facilities for making 1,000 lamps a day, and a man engaged in canvassing the lower part of New York City for customers. From the figures of the amount of gas and steam power used he calculates to introduce his light at such prices as will send the gas companies into the milk or grocery business. The wires will be laid down in December, "The gas companies," he says, "are fighting hard to keep the city authorities from giving us permission to lay wires, but they are butting against a wall. Their days are numbered." The lights which went out last winter burned a little while and then were only used for experimental purposes. Some of them lasted 900 hours; but others only a few days. They were abandoned and the bamboo fibre substituted. "The chorus of abuse and ridicule which greeted me in January last," he says, "induced me to work without noise." The details are now perfected, and he seems almost as positive of his success as he was eight or ten months ago.

Wonderful Swimming of a Scotch Girl.

The young lady who has shown this wonderful endurance in water is a Miss Lizzie Gow, who swam from Dunoon to the Sloch Lighthouse, and was in the water one hour and fifty-three minutes. She is only 16 years of age, and when it was known that she intended to swim the channel, a gentleman also essayed to accomplish the feat. He swam vigorously for about a mile, when he was forced to take refuge in a boat, completely benumbed. Before mid-channel was reached Miss Gow's hands were benumbed, and she turned on her back and chafed them a few moments. Refreshed by the rest, she again proceded on her way. At this point she was joined by her brother from one of the boats following her, who is a splendid swimmer and diver, but he also had to succumb, after being half an hour in the water, Left alone, she followed the leading boats with indomitable pluck, and gradually neared the shore. The current was now, unfortunately, very strong against her, and her failing strength was unable to fight against the tide, and she made little or no progress. When within fifty yards of the shore she complained of cramp, and her friends advised her to leave the water. She complied, reluctantly, and, after entering the boat, was carefully attended to. After partaking of refreshments and resting an hour she returned to Dunoon, none the worse for her daring swim.

A Bloody Room-Mate.

It was at the time of a county fair, and the village was crowded.

A man, carrying two round bundles carefully tied up, knocks at the door of an inn and asks for a room. They tell him that the best they can give him is a room with two beds, one of which is already occupied. Under the circumstances he is obliged to accept the vacant bed. The occupant of the other is fast asleep and snoring loudly when he enters the chamber. But he takes him by the shoulder, wakes him up rudely, and asks:

"Are there any rats or mice here?"

"I believe not, sir."

"All the better, for they gnaw everything they can find. Now, I have there," added the newcomer, pointing to the round bundles, "the heads of two persons whom I executed this morning, that I am taking to Paris, and you understand if there were any rats or mice——"

"Heads of persons!" exclaimed the other, turning pale.

Five minutes after, the possessor of these horrible trophies was alone in the chamber, where he slept comfortably until morning.

The bundles were merely two melons.

IT is said that profanity has increased fifty per cent. in this country since the telephone came into general use. The boy in the central office is all to blame.

The Wheat Crop of 1880.

Where It is Grown—Its Extent—Its Amount.

What Shall We do With It?—How Much Will it Bring?

(From the Milwaukee U. S. Miller.)

Within the memory of men now in active business the wheat crop of the United States was no element in the food supply of the world, outside its own borders.

Thirty years ago, American grain or provisions was not a known quantity of Europe, as there were no surplus for export. At that time, Europe, however hungry she might be, fed herself, or starved. The demand from England, which, owing to her small area of land, as compared with her population, has been for a century the great food-consuming country of the world, drew her supplies from the wheat fields of Russia, through the Baltic ports, and from the Mediterranean ports of North Africa.

Each geographical division of the globe: Europe, Asia, Africa, and America fed themselves, or starved. The great wheat fields of to-day were unknown and unexistent.

Now, through the medium of steam transportation, and the settling up of newer regions, the source of supply has been changed and most marvellously increased, while the point of consumption remains nearly the same.

England is still the point to which the surplus food of the world flows for a final market. Europe is the only division of the habitable globe that does not produce enough to eat. Russia, until the past fifteen years, furnished the surplus of wheat required to supply any European deficit. Since then marked changes have occurred in the sources of supply, and America, to-day, is furnishing so much of the wheat as to have become prime factor in the trade, furnishing, during the past year, 175,000,000 to 180,000,000 bushels in wheat and flour, of a deficit of 250,000,000 bushels. The balance of the deficit was not furnished, as formerly, by Russia entirely, but from sources even newer than America: India and Australia.

Russia is now the only European country that is counted on for any surplus, and as it is reported that, on failing crops, she can no longer be depended on for any definite supply, it is as well in all calculations to ignore her as a source of supply, although for years to come she will probably furnish a large but quite variable and indefinite quantity of the deficit.

The countries now looked upon as the wheat purveyors of Europe are North America (the United States and Canadas), India and Australia, of which America is of paramount importance, as she is able to supply any probable deficit alone.

In the United States only a small section comprises a wheat belt now under cultivation that produces an excess of the requirements of the population. Only nine States, according to the returns of last year, produced an excess for export, viz.: Minnesota, Iowa, Kansas, Missouri, Michigan, Wisconsin and Nebraska, on the Atlantic slope, and California and Oregon on the Pacific. The adjoining Territories are, however, being rapidly developed, and will this year go to swell largely the increased productions of the States above named.

It will be noticed that the wheat territory is confined to the section north of the Ohio, and west of the Mississippi river, and to the great Pacific slope. The great unsurveyed, and as yet unsettled, areas, in the tract thus imperfectly described, adapted to the raising of wheat, is practically illimitable. Not one-tenth of the land is yet occupied, and if it were all under cultivation, as are the older parts of Minnesota, would produce in one year sufficient to supply twice the quantity the whole world requires. The world's present consumption of wheat is estimated at 2,000,000,000 bu. The present production of the American wheat belt is about 500,000,000 bu. With the undeveloped lands constantly being utilized, the increase in wheat production is likely to far outstrip that in other portions of the globe, and only the interposition of obstacles to the free movement of the wheat to points of consumption can thwart the apparent destiny of this country as the granary of the world for years, if not centuries, to come.

To that lying within the boundaries of the United States is to be added a vast area in the Dominion of Canada, stretching along the lakes, through the Red River country, and ending in a vast unsettled region, believed to be admirably adapted to the raising of small grains.

The wheat crop of the United States is designated by two generic terms—"spring" and "winter." The spring wheat is grown on the lands north of the parallel of 40 degrees, and mostly in the States and Territories north and west of the foot of Lake Michigan. The spring wheat section comprises the States of Wisconsin, Minnesota, Iowa, and the adjoining Territories.

The winter wheat States comprise, on the eastern slope, Michigan, Illinois, Missouri, Kansas, Nebraska, and all the States south of the Ohio river, as well as the entire Pacific slope, comprising California and Oregon.

The production, owing to the immense increase in California, Oregon, Missouri, and the States along the Ohio valley, has for the past year made winter wheat the prime factor in the trade. It is harvested earlier than spring wheat, and goes into the channels of trade before the spring wheat is garnered.

The rapid opening up and settlement on the Dakota and other northwestern lands, is again increasing the supply of spring wheat, and may ultimately give it the preponderance, as to quantity, which it formerly held.

The Crop of 1880.

The reports throughout the harvest season were, as usual, conflicting, but at the close of this week the wheat of the whole country is garnered, and the reports are nearly unanimous that the crop is bounteous and the quality excellent,

Winter Wheat.

The harvest commenced earlier than usual in the Southern States, and was unexceptionally good both as to quality and quantity, —so good as to force an unusual amount into market during the past month. Michigan reports a crop of 34,000,000 bus. of white winter wheat against 31,000,000 bus. last year. Illinois and Indiana show a much larger acreage and a better yield. On the Pacific coast the increase both in acreage and yield is large. The San Francisco *Journal of Commerce* estimates the crop at 56,000,000 bushels, which is in excess of the crop of last year 20,000,000 bushels, or nearly 40 per cent. Oregon reports a gain of 30 per cent, both in acreage and quantity. It is believed that there is a surplus from export from California and Oregon of not less than 45,000,000 bushels, the San Francisco *Journal of Commerce* estimating the surplus of the State of California alone at 25,650,000 centals—42,750,000 bushels.

Spring Wheat.

The spring wheat sections have doubtless produced an amount of wheat largely in excess of the bounteous harvest of last year.

In Wisconsin, floods on the rivers and unpropitious weather have, in some parts of the State, nearly destroyed the crop, but the damages have not been in the best wheat-growing sections, and the crop of the whole State it is believed will aggregate as large as last year, although owing to the fact that the southeastern portion of the State has turned largely to winter wheat, the supply of spring wheat may show a slight decrease.

In Minnesota, which leads all others in the production of spring wheat, the crop is all harvested, is of excellent quality, and simply enormous in quantity,—the lowest estimate being 10,000,000 bus. in excess of last year, and the aggregate quantity being estimated at from 38,000,000 to 45,000,000 bus; 40,000,000 bus. is certainly not an extravagant estimate of the yield of that State this year.

Iowa gives only a moderate report, although the acreage has been considerably increased. If she furnishes as many bushels as last year, it will be better than we expect.

Beyond these States away out as far as railroads go, there is nothing but unieterrupted reports of great harvests of spring wheat, waiting purchasers and transpartation, The area of wheat acreage along the line of the Northern Pacific Railroad is estimated at 10,000,000 acres against a known acreage of 6,000,000 acres last year. At the very moderate estimate of 10 bushels to the acre, this would give 100,000,000 bushels of wheat in that region, one-half of which has never entered into any statistical statement before.

Thus having in a general way reviewed the situation we come, in the absence of figures, which will be accessible to nobody till the wheat is sold and passes into the cnannels of trade, to the attempt to estimate the volume of the enormous crop that is now gathered.

The Amount in Bushels.

The crop of last year, according to the reports based on what has already gone into channels of trade, was 450,000,000 bushels. There is certainly no State in the Union that records a less yield than last year. Taere is to be added to the product of last year the acknowledged increase in Minnesota of 10,000,000 bushels, in California of 20'000,000 bushels, in Dakota of, say 1,000,000 bushels, in Michigan of 3,000,000 bushels, and that of all the outlying territory along lhe lines of Western railways which cannot yet be ascertained, except in a general way not reducible to figures.

Assuming the crop of 1879 to be correctly stated at 450,000,000 bushels, there can be no reasonable doubt that that of the present year will exceed 480,000,000 bushels, and is quite likely to reach 500,000,000 bushels. The increased acreage reported by the Agricultural Bureau as sown this year, corroborates our estimate if the yield does not fall below the average for the past len years.

The question now paramount is, *What shall we do with it?* We may, although no country ever did, use for seed and home consumption 5.5 bushels per capita, which for 50,000,060 of pppulation would dispose of 275,000,000 bushels. This leaves, estimating the crop at 480,000,000 bushels, 205,000,000 bushels surplus. Add to this the visible supply reported last week, of 13,000,000 bushels, and it shows a surplus of 218,000,000 bushels.

Last year, under a most extraordinary demand from Europe, we exported 180,000,000. This is hardly likely to occur during this yeur. The general harvests in Europe are, instead of being unexceptionally poor, ss last year, fairly good, and consequently no demand above ordinary years can be reasonably expected.

The followiug table shows the exports of wheat and flour, and the prlce of wheat for the past ten years, also the acreage, yield and products in the United States:

Years.	Acreage.	Yield per Acre.	Total Product Bus.	Price per Bushel.	Total Value of Product.	Wheat & Flour Exported. Bus.
1870.....	18,092,591	12.4	235,884,700	$1.04 .2	$245,865,045	52,574,111
1871.....	19,943,803	11.5	230,722,400	1.25 .3	290,411,820	38,995,755
1872.....	20,858,359	11.9	249,007,100	1.24	310,180,375	62,014,715
1873.....	22,171,676	12.7	281,254,700	1.15	323,594,806	91,510,398
1874.....	24,997,027	12.3	310,102,700	0.94 .1	291,107,895	72,912,817
1875.....	26,381,512	11.0	292,136,000	1.00	294,580,990	74,750,682
1876.....	27,027,021	10.4	280,356,500	1.08 .7	300,259,300	57,149,946
1877.....	26,277,546	13.9	364,194,146	1.08 .2	394,695,770	92,141,626
1878.....	32,108,560	13.1	420,122,400	0.77 .7	326,346,424	150,502,506
1879.....	32,545,899	13.1	448,755,118	1.11	499,008,803	180,000,000

From the above table it will be seen that the average export demand for Europe, adding the extraordinary demand for the past two years, is less than 86,000,000 bushels per annum. It is therefore hardly to be expected that the apparent surplus will find an ultimate market at present prices.

The crop will start from the granaries of the farmers, and after going through the eddies of speculation, and resting in the ponds of local trade, find its level at much lower prices than have ever before been known in this country.

There are, however, counteracting influences which it may be well to consider.

The sparse supply of the European countries for the past two years has entirely depleted the ordinary reserve. With a revival of business, and a reinforcement of their purchasing power, which has been so weak for the past two years, they would not only buy what was demanded for immediate consumption, but refill their exhausted granaries. So, at fair prices, the immense surplus of the American wheat crop of 1880 may be disposed of.

It will, however, find its path to a legitimate market through devious ways. Speculation will stand in its way, although ultimately it will force its own channel.

As to the price of the article, that is "a thing no man will find out"—that it ought to be lower than ever before, under the law of supply and demand is certain. Excepting corn, there is no product of the earth in such superabundance as wheat, and, relative to other necessities of life, it must take a much lower range in price than now obtains before it can be consumed.

MINES AND MINERALS.

OUR MINERAL RESOURCES.

In the next issue of the Lumberman, we propose to follow up the important subject of the mineral resources of Canada, and will refer at some length, to a sketch by Mr. Garret, a well-known Geologist at Ottawa, of the economic minerals, which are to be found in the Ottawa Valley.

Phosphate Mining in Quebec.

Montreal, Oct. 2.—There is a good deal of misstatement going abroad in regard to the transaction between Messrs. Dion Bros., phosphate manufacturers, of Granville, France, and the Local Government. It is asserted in a local journal this evening, that the firm in question has obtained a large amount of phosphate land in this province from the Government. Your correspondent was informed by the Premier this evening that there has not been granted a single acre of the public lands, and what is more, it is not contemplated to grant any. Some time since the head of the firm, who is here, made an offer to the Government to establish extensive works for the manufacture of sulphuric acid, which is used in the reduction of phosphates, to be used as a fertilizer. They stated that seaweed, which was one of the substances necessary, could be easily procured at the Saguenay, and other places in Canada. The Dion firm is largely engaged in the same business in France, and the Government, looking upon the proposal as one of infinite importance to this province, agreed, if Messrs. Dion would carry their proposal into effect within one year, to grant them a bonus of $4,000 per annum for ten years, on condition of their supplying to the order of the Government up to 2,000 tons per annum for the same period, at $26 per ton. This is considered a cheap price, as the same kind of fertilizer imported here costs at present $40 per ton. Mr. Dion agreed to the Government terms, whereupon an order-in-Council was passed granting the bonus, and here the matter rests. No agreement or anything else has been signed, but there is no doubt so advantageous an enterprise as the one in question will be entered upon without delay. It is the Messrs. Dion's intention to purchase mines immediately, and they expect to convert about 50,000 tons annually into manure. Nothing definite yet has been determined upon as to the sight of the factory, further than that Montreal is considered the most central point for it. The outlay of money which this enterprise will cost the Messrs Dion will be enormous, but they expect to meet with a large return. The advantage of the arrangement which the Government has made for the province can be estimated, when it is stated that Mr. Joly offered Mr. Goldring if he would erect such a factory, $10,000 per annum. The quantity of phosphates to which the Government will be entitled will be distributed to the farmers through the local agricultural societies.

Phosphate mining in Ottawa county is quite brisk. Mr. William McIntosh, agent for the Pickford Fertilizing Company of London, England, is working the High Rock Mine formerly owned by Richie & Co. The mine has been worked for the last two months, and some 900 tons of phosphate have been taken out, and twelve men are constantly employed. Mr. J. McFarlane & Bros. are working the Preston property. They have taken out about 600 tons this season. Messrs Humphrey and Adams at the Gore of Templeton, have extracted about 600 tons with a small force of men.

A man being tormented by corns, kicked his foot through a window, and the pane was instantly gone.

"THE SULTAN'S EVIL GENIUS."

THE MAN WHO SWAYED THE DESTINIES OF AN EMPIRE—A THOROUGHLY UNSCRUPULOUS FELLOW—MORE THAN A MATCH FOR THE DIPLOMATS OF EUROPE.

The London correspondent of the New York *Sun* is personally acquainted with Said Pasha, the new Prime Minister of Turkey, or rather the *old* minister restored to power. He has nothing good to say of him. Here is the way in which he describes Said's rise to power. "In the early part of last year he was Minister of Justice, and the official world of Constantinople was even then surprised and disgusted at his sudden rise to a position of so much influence. At the commencement of the Russo-Turkish war he had never been heard of. He was then an obscure clerk in a public office, and was brought to the notice of a very powerful personage in those days, Mahmoud Damad Pasha, the Sultan's brother-in-law, and the evil genius of Turkey; for it was owing to the unscrupulous ambition, the jealousy of all rivals, and the overwhelming influence which this thoroughly dishonest man exercised over the mind of his Majesty, that the latter refused to listen to the counsels of wise and patriotic advisers, distrusted all officers, naval or military, in his employ, and confided the fate of his army to such unmitigated scoundrels as Suleiman Pasha, Eyoub Pasha, and others. Such a man, universally mistrusted and detested by all the better sort of Turks, needed some instrument as thoroughly unscrupulous as himself, and willing to do the dirty work which formed the staple of his political occupation. Such an instrument he found in Said Pasha, and as the use the latter could be turned to was agumented just in the degree in which he was advanced in influence and position, the Sultan was induced, by the advice of his brother-in-law, to promote him with great rapidity." After the treaty of San Stefano the Sultan, in a violent reaction of rage, sent Mahmoud Damad into exile, from which he has never been allowed to return. Said saw the storm coming, prudently turned traitor, denounced his former patron, and was finally made Cabinet Minister. Here are first impressions. "As a rule a Turkish Cabinet Minister is cold, haughty, dignified and reserved, but Said Pasha was exactly the reverse of all this. Instead of a burly man, sitting on a divan, with one leg tucked under him, imperturbably smoking a cigarette, after the manner of a conventional Ottoman functionary, I saw a Parisian looking little creature trot into the room—a creature with a restless, furtive eye, and a quick, uneasy manner, in which extreme cunning seemed blended in equal proportions with abject servility. Had I been the representative of a great power, he could not have been more overwhelmingly civil, or more profoundly distrustful of my intentions. But I no sooner entered into conversation with him than I was struck with the extraordinary intelligence which his ferret-like features displayed. He is a very minute man, with a stoop, and a remarkably soft, gentle voice. He manages after a time to make you forget your first mistrust, and reproach yourself for having done him an injustice. It is only after the wearisome experience of months that you discover he has been from that first interview you bitterest enemy; that the salient points which he took care to dwell upon in your conversation as more particularly meritorious are precisely those which he has specially denounced, and that his only object in keeping you on the most friendly and confidential terms has been to find out new ways of betraying your confidence. When he discovers that you have found him out he becomes invisible; and, as by this time most people have found him out, he sees scarcely any one. When he first became Prime Minister in October, last year, his oily and engaging manner, and his earnest professions of good faith, deluded most of the diplomatic representatives at Constantinople, but one by one they remarked his treachery, and finally, on the arrival of Mr. Goschen, and at the instance of the latter—for he had been forewarned what manner of man Said was—the Sultan dismissed him."

But Said was too clever to be got rid of in this way. He was friends with all the eunuchs, pipe bearers, mollahs, and other riff raff of the palace, and through their influence managed to retain nearly all his old authority. The Sultan, tired of keeping up appearances, at length dismissed Kadei, and restored Said. This was a direct snub to the English Government at the very moment when their naval demonstration had reached its culminating point. The views of this correspondent on the future prospects of affairs in the East are worthy of attention.

"What Said will do now that he is again responsible in the eyes of Europe, remains to be seen. What particular bait he will dangle before the powers, what apple of discord he will throw among them, what new and unexpected device he will hit upon to ward off the impending catastrophe, it is impossible to conjecture. He has proved himself more than a match for such distinguished and tried statesmen as Khaireddin Pasha and Mahmoud Nedim Pasha, both of them ex-Grand Viziers, with far more real statesmanship than this pliable adventurer. It is possible he may still pilot Turkey through the storm; but on the face of it his reappointment augurs badly for the success of Mr. Gladstone's policy, for there cannot be a question that Said Pasha is the personification of that passive resistance and that determined hostility to the foreigner which are especially acceptable to the Sultan. He is opposed to all internal reform, for he depends for support on those who fatten by abuses, and, being utterly destitute of anything like a sentiment of patriotism, he would unhesitatingly wreck the ship of State if he thought that the advice that would save it, might be unpalatable to the Sultan, and therefore wreck Said Pasha.

This has always been the trouble. No one dares to tell the Sultan the facts. Honest men who endeavour to open his eyes to the dangers by which he is surrounded, and give him advice which is unpalatable, because it implies concession to the foreigners and the introduction of reforms by which his own power would be limited, he distrusts, and finally gets rid of; and there are always to be found plenty of self-seekers who see that the royal road to favour is by confirming him in all his prejudices, exciting his suspicions against the men they fear because they are honest, while they encourage him in his belief that the only true policy is one of determined obstinacy and defiance in so far as the European powers are concerned.

Hence it is that the calculations of those powers are always wrong. Knowing the true state of the case, they suppose that the Sultan knows it too, and they cannot understand an infatuation which impels him to his own destruction. This has been the secret of his passive obstructiveness. The explanation of the recall of Said Pasha to power is that the Sultan wishes to be strengthened in his attitude of resistance, and to believe that the danger is not so great as it is represented to be. Said is quite ready, for his own purposes, to confirm his Majesty in this view, and to give him the advice which he thinks will be most agreeable to him, perfectly regardless whether it is the best under the circumstances.

The Raising of the Tay Bridge Girders.

The work of raising the *debris* of the Tay Bridge from the bed of the river is now completed. About 6000 tons of iron have been recovered and beached at Broughty Ferry and Tayport, at a cost, it is reported, of about £10,000 or £12,000. A considerable proportion of this expenditure will be met by the amount derived from the sale of the iron. In each of the twelve fallen piers there were forty-two pillars, making a total of 504, and the actual number recovered is 510, the half-dozen extra columns being those which fell along with the two girders which were blown down during the construction of the bridge. Portions of those two girders, to the weight of about 150 tons, which had been left in the bed of the river, have also been raised. The work of lifting the material was begun at the end of February, and has been continued until the present time. During the spring, however, the work was greatly retarded by reason of the weather, and the actual working time has been only about four months. Mr. Armit, who superintended the work on behalf of Mr. Waddell, the contractor, deserves praise for the vigour with which he has pushed on the operations; and the fact that the work, which was necessarily of a very hazardous character, has been successfully accomplished without accident, is due in great measure to the care which he exercised for the safety of the men under his charge.

Messrs. McAllister & McLean have sold their Pettawawa limits to James McLean & Co. The figure received, we believe, was something over $130,000, a very handsome and no doubt satisfactory one to the sellers, who purchased the same limits something over a year ago for only 40,000. This sale demonstrates better than anything we have yet heard how the lumber trade is "booming."—*Pembroke Observer.*

Gored by an Angry Bull.

FARMER JOHN MURRAY'S BATTLE FOR LIFE IN HIS STABLE—THE GROANS THAT CALLED MRS. MURRAY TO THE RESCUE OF HER HUSBAND.

John Murray is a farmer living in Walker avenue, near Grand Avenue, Greenville, N. J. His two story-house stands in the avenue, and behind it he pastures his cattle. The animals are housed at night in small sheds, one story in height, in the rear of his house. In his herd is a young short-horn bull. The bull is a wiry animal, but has heretofore never shown an ugly disposition. On Wednesday evening Mr. Murray went out of the house, saying to his wife that he had forgotten to give the animals a drink of water all round. He would do it before he went to bed. He had not been gone long before Mrs. Murray heard groans from the direction of the barn. She ran out of doors and called her husband's name. There was no reply, except another groan, that unmistakably came from the barn. Mrs. Murray hastened to the barn, and as she approached the bull bounded out of the stable and ran into the open lot. She found Mr. Murray lying on the stable floor, with his left hand upon a wound in his left side. He had been pierced by the horns of the bull so that part of his intestines protruded. Mrs. Murray called for help, and her sons came and aided her to carry Mr. Murray to the house. Dr. Wilkeson of Bergen avenue was summoned, and the wound was sewed up. He says that three days at least must elapse before he can announce positively whether Mr. Murray is out of danger.

Mr. Murray was seen yesterday by a reporter for the Sun. His bed was surrounded by sympathizing neighbours. He is in the prime of life, and if an active life and a hardy constitution can avail he seems pretty sure to recover. He willingly related the story of the struggle he had with the bull. He said: "The bull is a young fellow and a smart one, too, but I never knew him to be ugly before. He seemed to be as gentle as a cow. It was my custom to tie him by a rope; one end of the rope was around his horns and the other end was fastened to the manger. When I went into the stable I untied the rope; and led him out peaceably enough. When I attempted to lead him back he hung back and yanked at the rope viciously. I pulled at the rope and threatened and coaxed the bull by turns, and at last got him inside of the stable. When I had got him inside of the stable I was sure that he was in my power, and as he gave a lunge for the door I twitched the rope around his horns as sharply as I could. This seemed to make him mad. He made a dive at me and I jumped to one side. Then I saw that I had my hands full. By this time I was pretty mad myself. So I gave the rope another yank and yelled to the bull to behave himself. I thought that I could frighten him. But the next thing I knew he had pinned me to the side of the stable with his horns. I couldn't catch my breath. His horns were small and sharp, and he jabbed at me viciously. I couldn't get hold of his horns, and there was no weapon within reach. My back was against the stable and his horns were against my abdomen. When he knew that he had me he just lifted his head up and pushed, and I could feel the flesh tear. Then the bull relaxed his hold and I dropped. Again he came for me and begun to gore and toss me. I made a great outcry and he darted out of the door. Then my wife came to my aid.

Whipping for Certain Kinds of Criminals.

(From the Journal of Commerce.)

On the 15th ult. one of the most brazen-faced ruffians who ever stood up in a British court suddenly wilted and uttered a scream on hearing the terms of the Judge's sentence, and was taken away in a fainting condition. He had no defence. The evidence against him was conclusive. He was sure of conviction and of a severe sentence, and he knew it. But he was not prepared for one part of the punishment prescribed by Mr. Justice Stephens. He screamed and almost fainted, not in view of the twenty years of penal servitude, but because the Judge ordered, as a fitting prelude, thirty lashes from a cat-o'-nine tails. This man had robbed and attempted to murder by drugging, and then throwing from a railway carriage, a travelling companion, in whose confidence he had artfully ingratiated himself. It would have ended in murder but for the inability of the assassin to eject his victim from the car before the train stopped. The ruffian then escaped with his booty, but was followed by the half-stupefied, badly injured man, who staggered on the platform and gave an alarm which led to the capture of his assailant. This strange affair took place in a car (of the London underground line), of which the two men were the only occupants. Mr. Justice Stephen, in passing sentence, said it was "the most cowardly and brutal outrage that had ever been brought under his notice." He marked his sense of horror, as well as made the sentence a wholesome caution to all other like-minded desperadoes, by prefixing the thirty lashes to the twenty years' imprisonment. The prisoner would not have flinched from the incarceration, but he winced terribly under the judgment of the cat, as if he already felt her nine tails raising wales on his bare back.

It is the uniform experience of British Judges that corporal punishment is the most certain known deterrent of cowardly and brutal offences. When any peculiarly shocking crimes against the person begin to become common in England, the Judges always check it by ordering a doze of the cat, well laid on, in addition to a long term of imprisonment with hard labour. This is the best known preventive of outrages on women and children. It is the only thing that has put a stop to garrotting. Its success is so marked in the declining frequency of cruel and malicious assaults upon the person in England that the British public almost unanimously approve of it. Only a little minority of those philanthropists whose sympathies for criminals rise in exact proportion to the diabolism of their proteges, continue to protest against the lash as a remedial agent of society. While that agent does so manifestly good a work in England, it will be judiciously conserved there. The theoretical opposition to it in the United States is widespread and intense, as any man finds out to his cost who proposes to reintroduce it in our judicial system. But now and then thinking Americans will brave the consequences, and ask themselves and their neighbours if corporal chastisement, so common among our ancestors as a penalty for minor violations of law, might not be revived, with signal advantage to society, for the punishment of certain specially atrocious crimes.

GENERAL.

All reports from France and Italy agree that the silk crop in those countries will be more abundant this season than for the past ten years. Advices from different districts in Japan, announces that only about four hundred and fifth thousand cartons will be manufactured this year, and, as a considerable quantity will be required for home use, it is expected that the cards available for exportation will realize very remunerative prices.

At the sale of a herd of a noble stock owner in England, the other day, two young bull calves of the purest bred short-horned family to be found in Britain, and with a pedigree back to the fifteenth generation, were sold to the owner of a Californian ranch for 800 guineas apiece. The owner had his costly purchases conveyed to town in a special waggon, and then had their lives insured at a high premium before starting them on their long westward journey.

A Hugoistic sketch: He was a newspaper man. He carried a big club in his hand. He walked firmly and determinedly up stairs to the composing room. He had a bad look in his eye. He walked straight up to where the intelligent compositor was eagerly butchering manuscript. He raised his club on high and felled the i. c. to the floor. He clubbed the i. c. into a jelly. He was arrested and tried for murder. He asked for a jury of newspaper men and got it. The jury, without leaving their seats, brought in a verdict of justifiable homicide.—Solid.

No Christian grace is likely to be called into play more frequently than that of Mutual forbearance. If we resent every apparent injustice, demand the avenging of every little wrong, and if all the other persons in the circle of our acquaintance claim the same privilege, what miserable beings we shall be! We need to guard against a critical spirit. Some people carry a microscope fine enough to reveal a million of animalculæ in a drop of water, and with these can find countless blemishes in the character and conduct even of the most saintly dwellers on earth. Bear and forbear is a good rule for all.

AGRICULTURAL NOTES.

Composting is the art of mixing organic matter, such as straw, muck, dead animals, etc., that must undergo decompsoition before they become available as plant food, with inorganic matter that will absorb and retain the valuable gases that the organic matter would otherwise let pass into the air and thus be lost. Such a mixture must be kept moist, but not exposed to rains that would wash away the valuable soluble salts. Stable manure and muck make an excellent basis for a compost heap, with which ashes, leached and fresh lime, weeds (not in seed), waste matters, etc., can be mixed.

Lice on Stock.—A number of letters ask for remedies for lousy stock. Vermin of some kind very frequently infest domestic animals; they are mostly of the louse type; small parasitic animals that must be removed by the application of some insecticide. A number of substances have been used to a greater or less extent, of which a few are mentioned below:—One pound of Tobacco and six ounces of Borax boiled in two quarts of Water, to which Soft Soap enough is added to make a thick paste, has proved a good vermin salve. A mixture of Carbolic Acid and Soft Soap in the proportion of one to four makes a compound easy to apply, and very effectual. Shortly after, the parts to which the soap mixture has been applied should be washed with pure water and a non-drying oil rubbed on. Oil of Turpentine and Lard Oil, equal parts, with a little Carbolic Acid, is perhaps the most convenient mixture to make, and effectual in its application. Animals that are affected with vermin need better care and higher feeding in order to overcome the drain that those parasites make upon the system.

Nutriment in Fruit.—The mind grasps values by comparison. The chemist tells us that an egg weighing an ounce and a half is equivalent in food material to 17 ounces of cherries, or 22 oz. of grapes, 30 oz. of strawberries, 40 oz. of apples, 64 oz. of pears. We thus see that fruits are not very solid food. But we do not think any the less of cherries, apples, and pears, because they are not as concentrated in nutritive elements as the egg. They are no less a part of the best food of the human race, and most persons will continue to eat them.

Preparing and Seeding Ground for Meadow.—The practice of sowing grass and clover alone without any so-called foster crop is becoming general. It is found that the supposed nursing crop has quite a different effect from fostering or encouraging the tender grass, but chiefly robs and destroys it, unless the soil is unusually rich. The more successful practice is to prepare the soil by thorough ploughing—rolling if necessary, and harrowing so as to procure a fine tilth, and sow the seed early in the spring, without any accompanying crop. The preparation of the soil in the spring is completed by a dressing of fine manure, and a thorough harrowing, a shallow ploughing being given if necessary. Harrowing will be sufficient in the majority of cases. After a fine harrowing the seed is sown. A mixture will be found most satisfactory. Mixed crops, as a rule, yield in proportion to the increase of seed. Thus, a usual seeding of Timothy or Clover, or both, will give a certain quantity of hay; if Orchard-Grass is added, a crop of hay will be taken equal in amount to that expected from the Timothy or Clover, but two or three weeks earlier. A second crop may be taken later, of which the Timothy will furnish the bulk, and the Orchard-Grass will fill up the bottom. If Kentucky Blue Grass is added, or Rhode Island Bent, a later crop will be given, which can be mowed for rowen, or will give the best fall pasture without injury to the roots of the Timothy or Orchard-Grass. The mixture here indicated is one that may be suggested for trial. It has been tried and found successful and desirable in all cases, and deserves a more extended application. The seed has been sown in the following proportions: One bushel of Orchard-Grass, one-half bushel of Kentucky Blue Grass, one-half bushel of Rhode Island Bent, ten pounds of Timothy, and six pounds of Red Clover. The Blue Grass appears later than the others, and fills up the vacant spaces left by the failing clover, which disappears after the second year. The advantage of the mixture is chiefly that a fine thick bottom is produced, which covers and protects the ground between the stools of the coarser grasses, and which furnishes a second crop for hay and a third for pasture. For soiling purposes the mixed seeding is even more useful than for pasturage, as the grass may be cut at any season without danger of injury from a dry spell. These particulars are more pertinent for the spring than the present season, yet if one would avail himself of them he must make preparation now, and not delay.

Grasses for Decoration.—A bouquet or vase of properly dried and tastefully arranged grasses of the more graceful sorts, is a very pleasing decoration for the parlour or sitting-room in winter. The beauty of a grass depends largely upon the delicacy of its flower clusters, and their graceful and orderly arrangement in the *panicle* or "head." As a type of beauty among the larger grasses, a long feathery plume of the Pampas Grass may be chosen, and indeed it is a very pleasing object when preserved in its original shape and colour. We must here enter a protest against the violation of nature by dyeing the plumes of grasses any colour whatever. They, to our taste, can not be improved upon by being coloured a deep crimson, an unnatural green, unpleasant black, or any other colour. Grasses for their greatest beauty should be gathered just as they are fully in flower, and hung up or spread out to dry in a place that is free from dust. If a grass is gathered after it is beginning to mature its seed, the floral parts will become brittle and soon fall to pieces, and fail to be the objects of beauty that they would be if gathered when just at the opening of the flowers. There are a number of native grasses that are worthy of a place in such a collection. In general, it may be said that any grass that is attractive for its delicacy, grace, and colour while growing in the field, will not be disappointing when it is tastefully arranged in the house.

"'Tis love that makes the world go round." It also makes the young man go round—to the home of his girl about seven nights per week.

Nicely coloured autumn leaves are worth fifty cents per hundred pounds to bed street car horses. Think of this as you feel the sad tears rising.

PERSONAL.

It is a touching piece of self-forgetfulness on the part of Queen Christina to name her baby Mercedes, for her husband's first love.

Christine Nilsson lately refused to sing for a "charity" at Aix-les-Bains, where she has been staying, declaring that charity began at home, and she was there to get rest.

At a recent English wedding the bride's nephew, dressed in a ruby velvet Cavalier suit, acted as page, holding the train; and the thirteen bridemaids wore mob caps, puffed sleaves, long mittens, and paste buckles.

Madame Barbault, who was lately married to Mr. Andrew Johnson, a relative of the late ex-President of that name, has a right to wear the title of Duchess of Bourbon. She has been for some years a teacher of French in Erie.

Miss Flora Sharon, who is thought to be a pretty and charming girl, the daughter of the Silver Senator, is to marry Sir Thos. Hesketh, who, making a yachting tour round the world, paused at San Francisco just long enough to take the prize.

The picture of Madame Gerster-Gardini's baby is described by a bachelor as being very pretty and winsome, which inclines one to believe it remarkably attractive. The child is taken asleep in a wicker carriage, over which is leaning the slender Italian nurse.

The King of Denmark has given the Bernhardt a gold medal surmounted by a crown in Diamonds, and attached to the red-bordered white ribbon of the Order of the Danebrog—a distinction very rarely granted, and but to two other women—Nilsson and Trebelli.

Dr. Tanner crops up in the pages of nearly every English periodical, and will be referred to in every new encyclopædia and thousands of medical works. If he has not got money, he has got, in six weeks, as world-wide a reputation as Wellington or Byron in as many years.

The Baroness de Hatzfeld, whose divorce, for no other cause than that an ancestress was at one time connected with the stage, is disgraceful alike to her husband and the German court, is not a daughter, as was recently stated, or any blood-relation whatever, of Madame de Hegermann Lindencrone, the wife of the Danish Minister, but the sister of her first husband, Mr. Charles Moulton, and the daughter of Mrs. Charles Moulton, *nee* Metz, of Paris.

Sir F. Roberts, the conquering hero of Candahar and so-styled "Saviour of Afghanistan," is son of a clergyman of the Established Church in Waterford, Ireland. His brother, Samuel U. Roberts, is one of the Commissioners of the Board of Public Works in Ireland. Sir F. Roberts is a member of the order of Good Templars and a staunch teetotaler. He has a Good Templar lodge attached to every regiment under his command. Sir Garnet Wolseley is also a total abstainer.

The daughter of an official in high life in Vienna recently wore several times a superb dress of dark green material, trimmed with wreaths of leaves in another and lighter shade of green. During the season the beautiful complexion of the young lady underwent a sudden change, and was ruined by a painful and offensive eruption. After a time her physician, baffled by the symptoms, thought of the dress, had it subjected to a chemical examination, and found enough arsenic in the colouring to produce all the mischief, and a great deal more.

Dora Young, a favourite daughter of the Prophet, and one of the heirs of a large portion of his property, was lately to be seen at a Chicago hotel, and is described as a fine looking person, dressed in good taste in black satin and brocade, with costly rings on her shapely hands. Her manners are pleasing, and her conversation interesting. She is attached to the memory of her father, although she is no longer a Mormon, calls the system a dreadful one, and says that the Mormon wives, under their outward semblance of good-will, hate each other with a deadly hatred.

It is understood that Lady Burdett-Coutts will be given away, on the occasion of her marriage, by the First Lord of the Admiralty. The grandmother of this lady was a servant in the house of a brother of the old banker, Susan Starkie by name. He had her carefully educated, and then married her. Her daughters became Countess of Guilford, Marchioness of Bute, and Lady Burdett. Mr. Coutts' second wife figures in *Vivian Grey* as Mrs. Million. A brother of the Baroness died lately, without a will or any record of his property, and in his room were found two hundred and fifty thousand pounds in Bank-of-England notes.

The Princess Beatrice is so marked in her attentions to the ex-Empress as to strengthen the popular belief that she was intended for her daughter-in-law. The Princess was the first to meet the imperial lady on her return from Africa, going aboard the ship. Lately the ex-Empress spent a couple of days at Osborne, the Princess crossing over to Portsmouth to escort her. They walked about the grounds in the mornings, and rode with the Queen in the afternoons. It is understood that the ex-Empress makes her future home at Arenenberg, her villa on Lake Constance—a place already full of romantic and unfortunate associations.

An English earl who, ever since the wedding of the Duchess of Edinburgh, has desired to have in his family a necklace like the one worn by the Empress of Russia on that occasion, but who had been deterred by the simple fact that the Czarina paid nearly a million dollars for hers, happened to mention his wish to Mrs. Mackay, of Bonanza fame, in Paris, and was advised by her to look at diamonds in America. He has obeyed her instruction, and, for the sum of one hundred and sixty thousand dollars, is about to become the possessor of a necklace of fifteen magnificent white stones, ranging in size from that of a filbert to one three times as large, and matchless in brilliancy, together with a pair of solitaire ear-rings and a brooch, in which seven large diamonds and sixteen smaller ones imitate one of the earl's heraldic emblems.

Dangers of the Sea.

The difference between handling a ship so that she escapes a danger and in a way to plunge her headlong upon it was doubly illustrated on her last passage by the Algeria which has just arrived in New York from Liverpool. On her sixth day out the Algeria found herself in a heavy fog on the Banks of Newfoundland. The ship was feeling her way cautiously along, all eyes and ears, so to say, when from over the port bow there sounded a fog bell. It seemed some distance off. But Capt. Gill, swift as light, ordered a reverse of the engines. The screw flew round, the great ship paused, slowly backed, and none too soon. In a trice there loomed up through the fog a huge three-masted schooner rushing forward under full sail. Had the course of the Algeria been kept, had she failed to retreat at the moment she did, a collision would have been inevitable. The schooner flew on her way straight across the foaming wake of the steamship, and a terrible calamity that might have cost hundreds of lives was happily averted. Very nearly the same thing happened again on the same evening, the dangerous craft that approached the Algeria in this instance being another large steamer. This time the stranger was not seen through the dense mist, but the voices of persons on her decks were heard with startling distinctness, and the escape was apparently as narrow as in the case of the schooner. Eternal vigilance is as clearly the price of safety at sea as it is of liberty everywhere.

A Small Baby.

The Smyrna, Del., *Times* of last week contains the following: "Our town has a baby that has attracted the attention of the curious—men as well as women. It is a girl babe that came to the household of Mr. John Van Winkle, on Tuesday morning of last week, which weighed a pound and three-quarters, is 12 inches long, and is perfect in every way. Its wrists are about the size of a man's index finger, and a shoe one and a half inches in length will incase its foot, its head is about the size of a ball of wrapping cotton, and its body not larger than a man's wrist. It is queen of the household it doing well, and the physicians have hopes of itsbeing able before long to paste its hair on its forehead and pilot some unfortunste youth to an ice cream saloon.

"Yes," said Mr. Profundity, "it is the silent forces in nature that are the most potent. It is the silent strength of gravity that binds the world together; it is the silent power of light that gives life and beauty to all things; it is the silent stream that is deepest; it is—" "It is the still sow that gets the most swill," Mrs. P. put in, seeing her liege lord had got to the end of his rope of similes. It was kind of her, but it somehow spoiled the effect of his dissertation.

WOMAN GOSSIP.

Fashion Notes

PLAIDS will be the rage.

POLONAISES are very short.

POLKA-DOTTED hose are fashionable.

BUSTLES are worn with all street costumes.

DOTTED fabrics of all kinds are to be worn.

STRINGS of pears are braided or coiled in the hair.

GOLD and silver tinsel will be exceedingly fashionable.

THE Jersey and Pilgrim suits are both English in origin.

TWILLED all-wool delaine is a very popular fabric this autumn.

THE Derby hat will be very much worn again this autumn.

QUILTED petticoats of satin or farmer's satin will be worn.

OLD FASHIONED neckerchiefs are very popular with the ladies.

POWDERED hair will probably be one of the revivals this winter.

LONG plumes and broad ribbons are the soul of millinery this season.

MANY of the most elegant evening dresses will be made short this winter.

FELT skirts are very handsome this year, and come in all the new shades.

ORIENTAL coloured plaids of mammoth size distinguish many of the new goods.

JOCKEY costumes, consisting of long coat-basque and plain skirt, are stylish.

BEAD-EMBROIDERED belts are worn with the round waist, so fashionable this year.

HANDKERCHIEF dresses, of woolen fabric, will be exceedingly popular for fall and winter wear.

PLACQUE buttons, in the centre of which is a bunch of grapes or other fruit, are handsome.

JERSEY webbing or stockinet, in all the new colours, is sold by the yard for corsages and sleeves.

CROWN braids and puffs are entirely out of date, the fashionable coiffure being very flat and smooth.

CASHMERE-COLOURED buttons and belt buckles are seen on the Oriental costumes so fashionable at present.

CORDS, both beaded and plain, will be largely used in trimming polonaises and outside wraps this fall.

RICH, stiff, white satin, brocaded in silver or gold, is the appropriate fabric for an elegant wedding dress.

WIDE Josephine belts are worn with almost all costumes. These are sometimes laced in front and at the back.

Wafts.

"THE sun shines for all," while the moon looks placidly down on a few spooney couples.

WHAT is the difference between a fixed star and a meteor? One is a sun, the other a darter.

WEDDING cards are to be smaller than ever and made as plain, quiet, and genteel as possible.

MARRIED life reaches its acme of happiness when a woman can eat crackers in bed without any complaint from her husband.

IT is the dastardly young brother who remarks: "Sister Sal's all the fashion now. She wears a horse-belt round her waist, and I expect she'll soon have a saddle and bridle."

FROM the satisfied expression that often illuminates a lady's face while she is gazing in the mirror, the superstition has grown that mirrors are in the habit of giving women "taffy."

THE astonishment of the lightning when Aja defied it was nothing as compared to the feeling of the young man who makes his best bow to a bevy of young ladies, and bursts a suspender button in the act.

AT a recent marriage the bride was a young damsel who had been a great flirt. When the clergyman asked the usual question, "Who gives this woman away?" a young fellow present exclaimed, "I could, but I won't."

"O, MR. LINGERIE, you've got on your freckled stockings!" exclaimed a sweet child, on the Ocean house piazza, where that gentleman was the centre of an admiring feminine group; "and Cousin Julia says they just match your complexion!"

TODDLEKINS is a very small man indeed, but he said he never minded it all until his three boys grew up to be tall, strapping young fellows, and his wife began to cut down their old clothes and cut them over to fit him. And then, he said, he did get mad.

"WHAT do you suppose I'll look like when I get out of this?" indignantly inquired a fashionably-dressed young lady of a conductor of a fearfully overcrowded car the other day. "A good deal like crushed sugar, miss," said the conductor. And the lady stood up and rode four streets further, with the smile of an angel.

No Bitterness.

THE QUIET WAY IN WHICH TWO OLD GENTLEMEN DISCUSSED POLITICS.

[Petroleum World.]

Grandfather Lickshingle and Deacon Redspinner, two patriarchs in this community, were walking down the street together yesterday. It was remarked that two such venerable men were not often seen together, and people raised their hats to them as they passed along and spoke to them reverently.

"There's entirely too much bitterness in this campaign, deacon," said Mr. Lickshingle, "and I regret it exceedingly. Now, when we wuz young men, and took an interest in politics, we had none of this 'ere everlastin' cat-haulin'."

"Indeed we hadn,t," acquiesced Deacon Redspinner. "Take Jackson's campaign for instance. There wuz a lively interest taken by both parties, but there wuz none of yer bullyraggin' like we see now-a-days."

"That's a fact, deacon," said old Lickshingle, "but, between me and you, I never thought much of Jackson."

"He was a mighty good man, Lickshingle."

"He was small potatoes compared to some men we have now, deacon."

"Who d'ye mean," demanded the deacon.

"Well, there's Garfield," said Lickshingle,

"Garfield be danged. You know mighty well, Lickshingle, he couldn't have been elected hog-rieve in a hill town in Jackson's day."

"He's a darn sight better man than Hancock."

"Go slow, Lickshingle, go slow!" said the deacon, somewhat agitated.

"Oh, I know what I'm talkin' about," retorted Lickshingle, as he stabbed the pavement spitefully with his hickory cane. "Hancock's a stoughton bottle, that's what he is."

"An' what's Garfield? Great guns, what's Garfield? Didn't he lay a Cheap-John sort of a pavement around the capitol and charge the government $1,000,000 for it?" and the deacon's eyes blazed with indignation.

"See here, deacon! Look at your man Hancock's letter to Sherman. Didn't he try to blow up Washington with glycerine? Say, didn't he? Oh, I read the papers old man, an' know what's going on."

"Hancock's a good an' pure man. Didn't he fight like a bull-dog in the war of the rebellion? Where was Garfield skulkin' in the time of disaster? In Canady, by thunder, in Canady!"

"What wur Hancock doin' with a stiletto in his boot the night Lincoln was murdered? Answer me that. If Wilkes Booth had failed this Hancock was ready to finish the job. Don't talk to me! Don't talk to me!"

"It's a lie!" howled the deacon, as he whirled around and faced Lickshingle on the street.

"It's as true as holy writ, an' any man's a liar that says so," retorted Lickshingle, too much wrought up to be particular as to his phraseology.

"You're a bald-headed old scroundrel," yelled the deacon.

"You're an old leper, an' I can wipe the ground with you," howled Lickshingle, gripping his cane and advancing.

Friends jumped in and the two furious old men were dragged away in opposite directions. The deacon squirmed around in the arms of his captors, shook his cane at Lickshingle, and hissed:

"Your man Garfield would never have gone into the army if he he hadn't been drafted, and he wouldn't then, only he thought he would be able to desert—the onery son of a gun!"

THE late Rev. Dr. Symington, not feeling well one Sabbath morning, said to his beadle who was a "character:" "Man Robert, I wish you would preach for me the day." "I canna do that," promptly replied Robert, "but I often pray for you."

Jupiter in Perihelion.

Jupiter reached its perihelion, or nearest point to the sun on Saturday. This is an astronomical event of considerable importance, as it occurs only once in about twelve years. As the planet is some millions of miles nearer the earth than usual, an excellent opportunity is given for the study of its features. Even the smallest telescopes will now show some of the wonders of this great planet and it system of satellites, and, with large telescopes, astronomers hope, within a month or two, to add much to our knowledge of the chief member of the sun's family. Jupiter will remain the leading brilliant in the sky throughout October, shining so brightly that even Sirius must temporarily yield the palm.

There is another reason for the interest that Jupiter's arrival at perihelion excites. More than a year ago some professed scientific person on the Pacific slope wrote a pamphlet on the terrors of the perihelia of the four great planets Jupiter, Saturn, Uranus, and Neptune, which, it was represented, would occur nearly simultaneously, and with these planets in conjunction, fearful results to the earth were predicted. The false alarm was spread by other pretended savants, and, no doubt, awoke the fears, not merely of the ignorant, but of persons who knew enough of astronomy to be aware of the gigantic attractions that the planets exert upon one another. Stories of plagues, pestilence, famine, and death were based upon the supposed influence of the perihelia. Mr. Proctor and other astronomers sought to counteract the effect of this by showing, in the first place, that it was not true that the planets named would all be in perihelion together. In fact, Saturn does not reach its perihelion until 1885. Uranus will be in perihelion next spring, but Neptune, will not reach its nearest point to the sun until six or seven years hence. It was also denied by scientific men of high authority that there was any reason to fear evil results to the earth, even though the predicted perihelia should occur very near together. Still, alarm was felt, and no doubt, many persons will be pleased to know that Jupiter, the most powerful of all the planets, has reached the dreaded perihelion point, and is already turning to retrace his steps, without having in any way injured his sister planet, the earth.

That the sun has felt the approach of the great planet, was shown in the prevalence of vast sun spots and outbursts of gaseous matter, is not improbable, and through the reflex action of the sun upon the earth our our planet may, even now, feel the same influence in violent atmospheric phenomena. It is difficult to realize the enormous power of the bright speck, Jupiter, shining so quietly in the sky. A recent writer has shown that the power which the sun has to put forth to hold Jupiter in his orbit is equal to the combined strength of 170,000,000. bars of steel, each one a mile in diameter, Jupiter's pull upon the earth, according to the same authority, is equal to the strength of 23.000,000,000 bars of steel, each of them one foot in diameter. So, if the mere power of gravity were all that was required to make Jupiter's approach dangerous to the earth, evidently he is not lacking in the power. But no one need fear that the sisterhood of worlds which acknowledge the dominion of the sun will prove mutually destructive.

A Musical Cat.

This is time of the year when stories about "musical" cats, mice, etc., are started. The following is the latest: "A cat in Buckfield, Me., has developed an extraordinary discrimination in Music. The playing upon the pianoforte of all pieces, except 'Sweet Afton,' is listened to by her with indifference, if not satisfaction, but the sentimental melody above mentioned falls little short of moving her to tears. Wherever the cat may be when this tune is begun, she at once appears to the household, her face expressing the contention of painful emotions, and by violent rubbing against the persons of the members of the household, accompanied by every indication of distress, she mutely beseeches that the tune may be changed. Singing the song, or even whistling it, equally grates upon her sensitive nerves, and causes her equal pain. The only theory which at all accounts for this singular dislike of the particular tune is that which supposes that the soul of the 'Mary' who is celebrated in the ballad has, in the course of successive transmigrations, entered into the cat, and that the memories awakened by the song are too much for it." Next!

ALL SORTS.

An Ode to a Lot of Stovepipe

Infernal stuff, your nature well I know,
So, when I took you down six months ago,
Each piece I numbered so that I might tell
Exactly how you'd go together well.
And now the time for chilly days draws nigh,
To put you up again I madly try.
But all in vain. The joints that then did fit
Now do not come within an inch of it.
I get you two-thirds put in place and then
Crash you go tumbling to the floor again.
Once more I try. You're rather full of soot,
And I am getting daubed from head to foot.
I jam my thumb, but still I persevere,
One piece goes down again and rakes my ear.
I grab to catch the piece, another goes,
And, falling, scrapes the hide all off my nose.
And then another piece falls with a slam,
And then the rest goes down and I say
"Dam."
And then my blood gets boiling and I say,
By all that's blue, I'll fix you anyway.
Once more I go to work. By patience great
I get all but a single section straight.
And that I am about to place, when oh!
The chair I stand on tips. Down flat I go;
While on and round me, with a horrid crash,
The whole comes down again in one grand smash.
And then my wife remarks: "I never saw
A man so clumsy!" I say, "Hold your jaw!"
And for a man send, while I retire
To wash myself and swear, to vent my ire.

WHY shouldn t a puppy ride in a dogcart?

WHERE to go when short of money—Go to work.

THE man who died in harness probably forgot to shuffle off his mortal coil.

THE baker's business should be profitable, a good part of his stock is rising while he sleeps.

"HE sleeps where he fell," says a late ballad, which suggests that he must have been drunk.

NIAGARA FALLS are three feet lower than they were fifty years ago, but the hack fare is hire.

IT is absurd to suppose that a man can speak above his breath, since his mouth is below his nose.

THE law can never make a man honest; it can only make him very uncomfortable when he is dishonest.

AN ingenious locomotive engineer has just patented an improved "spark arreste." Here is another enemy to the course of true love.

DINER (sniffing)—"Waiter, I really think this fish is not fresh!" Waiter—"Yessir; can't answer for that sir! I've honly been 'ere a week, sir!"

"WHAT a blessing it is," said a hardworking Irishman, "that night never comes on till late in the day, whin a man is tired, and can't work any at all at all."

HOW time changes! In the good Old Testament days it was considered a miracle for an ass to speak, and now nothing short of a miracle will keep one quiet.

ANOTHER poet comes forward and says: "And I hear the hiss of a scorching kiss." Beats all what a man can hear if he is only mean enough to listen.

ALLUDING to Beecher's estimate that one female house-fly will lay twenty thousand eggs in a season, *The Church Union* thinks "it is a pity a fly couldn't be grafted on a hen."

WHAT is life? In infancy, a battle with colic; in youth, a struggle to keep out mischief; in manhood, a struggle with indigestion; and, in old age, the prelude of a contested will case.

NOT many miles from New Bedford a small company of coloured brethren decided "to take up a collection." The presiding officer offered to pass the hat himself, and, in order to encourage the others, he put in a ten-cent piece. After the collection, during which every hand had been in the hat, the president approached the table, turned the hat upside down, and not even his own contribution dropped out. He opened his eyes in astonishment, and exclaimed: "Fo' goodness, but Iz'e eben loss de ten cents I started wid!" The case called for urgent action. The presiding officer demanded the restoration of the ten-cent piece. But nobody came forward. After an impressive pause, a brother remarked, solemnly: "Dar 'pears to be a great moral lesson roun' heab somewhar."

THE CANADA LUMBERMAN

AND MILLERS', MANUFACTURERS', AND MINERS' GAZETTE.

ISSUED SEMI-MONTHLY AT TORONTO, ONT.

A. BEGG, - Proprietor and Editor.

TERMS IN ADVANCE (Post-paid):

One Copy one year..... $2 00
One Copy six months..... 1 00

ADVERTISING RATES

$1 50 per line per year; 85 cts. per line per six months; 50 cts. per line per three months.

Small Advertisements 10 cts. per line first insertion; 5 cts. per line each subsequent insertion.

Business Cards, Forms of Agreement, Bill Heads, &c,. promptly supplied to order, at the LUMBERMAN Office.

Communications, orders and remittances, should be addressed to A. BEGG, LUMBERMAN Office, 33 Adelaide Street West, Toronto.

TORONTO, ONT., OCTOBER 15, 1880.

We ask the indulgence of our patrons for the want of completeness in the management of the LUMBERMAN this week.

This copy of the LUMBERMAN is sent to several parties on whom our agents have not had the opportunity of calling. We will be pleased to have them all become subscribers, and to receive their subscriptions by return mail.

THE TANBARK TRADE.

This is a large and important industry, which concerns the general public more than would appear without close examination. During the present year, in the provinces of Quebec, and Ontario, as well as in the Maritime Provinces, there has been great briskness in the hemlock bark-trade. The expansion of other leather trade has created a larger demand for tanbark, than usual, for home consumption, and a very large traffic has been going on in the export of this article. It is reported that over eighty thousand cords of hemlock bark have now been sent across the lines from the Provinces of New Brunswick and Quebec, whilst our neighbours are saving their own hemlock forests for future use. Large quantities have also been exported to Chicago, Detroit, Buffalo, &c, from Ontario. The result of this is evident, namely: The extinction of our hemlock forests in a very few years, and the consequent closing of tanneries, with increased price of leather. The question is well worth the attention of the Dominion and local Governments. It has been suggested that an export duty should be placed on bark exported, and that the local Government should impose stumpage dues on hemlock trees cut for the purpose of having its bark exported, and also an export duty on extract of hemlock bark exported.

A New Brunswick paper speaking of the export trade, says: "We would press upon the Local Government the expediency of doubling or trebling the stumpage on bark for extract purposes. We would urge this because at the rate at which our hemlock bark is now disappearing, there will soon be none left for our own tanners. But these do not we believe use the extract, the latter which being exported, and fetching something like $25 per barrel. There are several parties engaged in New Brunswick stripping our forests of the bark, and some of these, we may instance the Shaw Brothers, come over here for bark, with which they supply their tanneries in Maine, while in that state there is yet much hemlock. Of course so long as they are allowed to strip our forests, they will do so, and when they have left nothing even for our own local tanners, they will then turn to what is standing in Maine; they will be able to undersell our tanners in the leather market, because our manufacturers then will have either to bring hemlock bark from afar, or use the inferior article. We cannot impose an export duty, but we can *treble the stumpage on bark for extract purpose*, which is the bark for export.

Another writer says: "It is claimed that hemlock, which will ultimately be of value as a commercial wood, is being destroyed; also by being left where peeled it offers a means of feeding forest fires and is, therefore, a source of danger to the more valuable standing timber. While admitting that there is some force in all this, it is well to look at the other side of the question. The objections hang upon contingencies, such as the prospect of our ever been obliged to fall back upon the hemlock for commercial purposes, and the risk of forest fires. On the other hand, we have the positive benefit to a large number of people which the bark industry undoubtedly is."

The *Moncton Times* remarks: "When the tree is stripped of its bark, it is left to rot in many cases. Of course the traffic in the bark is a source of profit to the shippers, but it may be questionable if it is wise to destroy our hemlock woods in such a wholesale manner, largely for the supply of the foreign markets. A correspondent suggests that an export duty be placed on the bark, which would be calculated to lessen shipments, and create new tanning industries in the province, thus keeping all the profits in the country."

"LOSS ON SQUARE PINE TIMBER."

The Commissioner on Crown Lands for Ontario in his able report for last year, says:—

The following will shew the estimated loss to the Province and the Revenue from waste in getting out square pine, from 1868 to 1877, both inclusive:—Total quantity taken from public and private lands during the ten years, 119,250,420 cubic feet; waste, one-fourth of each tree, equal to one-third of the total mentioned, viz.: 39,750,140 cubic feet, or say in round numbers 477 million feet board measure, which may be valued one-half at $10 per 1,000 feet, and one-half at $5 per 1,000 feet, representing relatively the prime timber beaten off and the inferior timber from the upper part of the tree, average value say $7.50 per 1,000 feet, equal to $3,577,500 loss to the Province for the ten years, or an annual loss in material wealth of $357,750,00.

The quantity taken from public lands during the ten years is 87,620,135 cubic feet, the waste on which on the basis given being equal to 29,206,711 cubic feet, or 350 million feet board measure subject to crown dues at $750 per million feet equal to $262,600 lost to the Revenue during the ten years, or at the rate of $16,150,00 per annum.

The loss to the country and revenue from timber destroyed by fires which might have been confined to a limited area, and possibly extinguished, before great damage had been done to the forest. had they not been fed by the debris of trees left to rot and dry, is incalculable."

NOVA SCOTIA CROWN LANDS.

The law regulating the prices of Crown Lands in the Province of Nova Scotia, pass-10 April, 1880, is as follows:—

1. The distinction between Crown Lands applied for for lumbering purposes, and Crown Lands applied for for agricultural purposes, are hereby abolished, and the price of all Crown Lands is reduced to forty dollars per hundred acres, and twenty dollars for any quantity of fifty acres or less.

2. The price of Crown Lands which have been improved and occupied for two years and upwards previous to the passing of this Act shall be twenty dollars for each hundred acres, or for each tract of less than one hundred acres, provided such price be paid on or before the first day of May, A. D., 1881.

While boring for water at Beeton Station on the Hamilton & North Western Railway, last week, at the depth of 40 feet an inflammable gas was reached, which took fire at the well's mouth in the evening, as a party was igniting a match to light his pipe. A pipe was placed over the bore, and the gas continued to burn, with a pale-bluish light. It is expected that petroleum will be found on digging deeper.

LUMBERING ON THE PACIFIC COAST.

A correspondent of the Muskoka *Herald* says this is the way they do things on the Pacific Coast (Puget Sound.)

The potato crop once gathered, the ravages of frost and rot are checked by drying, the machine known as the "Plummer Dryer" being the most effective for this purpose. A bushel of potatoes will produce thirteen pounds of the dried article. They are bought in immense quantities to go to the mines and saw-logging camps. No ship leaving that coast is considered "well found" unless they have a quantity on board for the use of the ship's crew. It is said that at present prices, which I have been unable to learn, a good margin is left for both grower and dryer.

Saw-logging in that region is carried on somewhat differently to what it is here. When all orders have been filled, stock lumber is cut pretty much as follows: Butt log, 24 feet; second, 32 feet; then 40 feet, until stopped by knots. The roads are graded 16 feet, with a skid let in across the road every 8 feet. The logs are barked when the sap is up—failing this they are "rossed" on the running side. Four yoke of oxen constitute a team, the hind yoke having a tongue and dog chain. The logs are strung one behind the other, with dogs and chains; one log, however, containing 6,000 feet, being considered a load. The greaser goes ahead of the team, with a swab and can of dog fish oil, and greases the skids. With regard to the wages paid, the chopper, who stands on a spring board while working, receives $75 a month and board; hook tender, who snips the ends of the logs, drives the hooks and attends to snatch blocks and snubbing lines, gets $50; sawyer, $60; barker, $35; head skidder, $40; second skidder, $35; teamster, $75; swamper, $40; greaser (a boy), $20. All payments are made in gold. Land that has less than 200,000 feet to the acre is not considered pine land A stock was lately cut out of a saw log in the mill at Tacoma, which measured 34x14 inches, and 120 feet long.

The *Mail* in arguing that additional facilities are required for prospectors obtaining reliable assays of ores, adds that a correspondent had written to Buffalo on the subject, and found that it would be necessary to obtain a consular certificate before minerals could cross the lines. American authorities charge a fee of $10 for an assay and certificate, and our correspondent says they require a statement of the locality in which the mineral was found. Of course such information would be quickly acted upon by American speculators, who already own the bulk of our mining properties. There appears to be a lack of mining authorities qualified and willing to furnish assays, and it would be in the public interest if the Provincial Goverment would appoint an officer to perform this necessary work for moderate fees.

The 3rd day of November next, has been appointed, as a day of general thanksgiving in the Dominion. for the bountiful harvest, with which the country has been blessed this year.

England vs. Australia.

Outside "the Derby" no such national gathering—estimated at from two hundred and fifty thousand to five hundred thousand—was ever assembled in England as at the great cricket match of England vs. Australia. Kennington Oval, where it took place, is a large space about four times the size of Tompkins square. Around this space, at a hundred feet from its outer circumference, was a solid ring of beholders, dozens deep. The inner rows squatted, the next knelt, the next stood, while the outer fringes formed the highest tier by scaffolding run up impromptu. Then the old and picturesque houses surrounding the oval were ridged and fronted with spectators, as was Rome when Coriolanus marched in. The gate money was five shillings. The receipts were enormous, and were divided between the teams. The colonials were badly beaten. Spofforth, their best man, was prevented playing by a wounded wrist.

Indian Farms in the North West.

SUCCESSFUL RESULTS OF THE GOVERNMENT'S EXPERIMENTS.

[Saskatchewan Herald.

The following figures show the progress made in some of the Indian farms and reserves in the west:—

At Fort Walsh there are two reserves—one of Assiniboines, numbering a thousand souls, under Chiefs Man-thet-Stole-the-Cato and Long Robe; and one of Saulteaux, also a thousand strong, and Chiefs Little Child and Pie Pot. On one of these reserves there are fifty and on the other thirty-five acres under crop, chiefly potatoes and barley. The instructors here have no farms of their own to look after, but devote their whole time to teaching the Indians. These Indians also do a good deal for themselves by catching fish in winter.

At Fort Macleod there is a Piegan reserve on which there are about nine hundred of that band. They are settling down to work, having a number of houses up, and from 70 to 80 acres under crop. The cattle to which this band is entitled under the treaty were being given to them. The Rev. Mr. McKay has settled amongst them and established a mission of the Church of England.

The Sarcees are settled at Blackfoot Crossing, and although few in number are doing well.

At Morleyville, Bow River, there areabout six hundred Assiniboines, who have some excellent farms, doing credit to the practical instruction by their missionary, the Rev. Jno. Macdougall, in former years. Cattle were also being given to this band and to the Sarcees. The quantity of land under cultivation is from sixty to seventy acres.

The supply farm near Fort Calgary is expected to show good results and to fulfil the expectations formed of it. It is under the management of Mr. Wright, and contains two hundred and twenty acres, chiefly under wheat and barley.

Mr. Bruce has charge of another supply farm thirty miles south-west of Fort Macleod, on which he has under cultivation two hundred acres of as fine land as is to be found in the North-West. Three miles off, on Pincher Creek, the Government has put up one of the Waterous Company's portable grist mill with which to grind the grain grown in that locality. It will in the end be cheaper than to freight in flour.

Many of the Indians at the south are surrendering some of the cows to which they are entitled and taking agricultural implements in their stead.

On Mr. Delaney's farm, Frog Lake, were planted 100 bushels of potatoes, 14 bushels of wheat, 20 bushels of oats, 30 bushels of barley, an acre of turnips and carrots; and on the reserve, 190 bushels of potatoes, 20 of wheat, 40 of barley, and a quantity of small vegetables.

On Mr. Williams' farm, near Fort Pitt, were planted 58 bushels of potatoes, 5 of wheat, 26 of oats, and 18 of barley; and on the reserve 240 bushels of potatoes, 14 of wheat, 38 of barley, and two acres of turnips and carrots.

We are without the exact figures of the Eagle Hills reserve, but understand that they are about the same, as in Mr. Delaney's district.

In order to prevent explosions of gas on board steam-ships, the Inspector of Mines for South Wales, Great Britain, suggests the employment of two pipes leading from the deck to each surface of coal, one of these pipes to carry down an adequate supply of fresh atmospheric air, and the other, by means of some suitable contrivance, such as a fan, to draw up what gas may accumulate below.

The project of a canal for ships from the Baltic to the North Sea, between the Bay of Kiel and Brunsbuttle, in the estuary of the Elbe, appears likely to prove a success. Its depth throughout is to be 20 feet and 9 inches, its width at the surface of the water 160 feet, and at the bottom 64 feet, the banks thus having a gentle slope. Provision is also to be made, by means of a peculiar system of locks and reservoirs, for increasing the depth of water to some 26 feet, whenever it may be desirable to do so, this depth allowing of the passage through the canal of the heaviest German ironclad afloat, namely, the Konig Wilhelm, a vessel of nearly 10.000 displacement, but drawing only 26 feet. In size this canal will not compare unfavourably with the Suez, the latter being 172½ feet wide at the surface of the water, 70 feet at the bottom, and about 26 feet deep.

OUR QUEBEC LETTER.

THE LUMBER BUSINESS IN THE ANCIENT CAPITAL—PRICES CURRENT—CONTRACTS FOR NEXT YEAR'S SHIPMENTS—MINING NEWS—A NEW INDUSTRY.

QUEBEC, Oct. 11th, 1830.—The principal part of the "Fall Fleet," is now in port, and wharves and booms at the upper end of the harbour are lined with timber vessels taking in the last cargoes which will be shipped from the Ancient Capital during the season of 1880. Lumber merchants are all busy in their coves, or in the town offices which are connected with the former by telephone and telegraph,—engaged in superintending the loading and shipment of lumber. When the last vessel of the Quebec timber fleet leaves port this fall, there will be left behind the smallest stock of lumber which has wintered here for many years. Even now there is hardly any stock held in first hands, so that there cannot be any extensive sales to report either at the present, or for some time to come.

If poor Jim Fisk were now here, and wanted to go in for one of his usual bold transactions, he would buy up all the remaining stock, and thus control the market. I wonder that some worthy imitator of the great New York operator has not appeared upon the scene here.

It is satisfactory to know that the leading shippers and brokers of Quebec have not only experienced a remunerative business this year, but are looking forward with "great expectations" to the operations of the coming season. I find that the best informed men in the trade are basing their calculations for the year 1881, upon the production of some ten million feet of lumber this winter in the lumbering districts of the Ottawa.

The contracts so far made by the Quebec brokers for next year's shipments are quite encouraging. The following are some of the principal

PRICES CURRENT:

Ohio Oak (sold for shipment in 1881) 51 cents per cubic foot; Michigan ditto., 50 cents; Canada ditto., (a good lot for early delivery) 49 cents.

Sales of timber actually in the market would command two cents more than the above prices.

Pipe staves have been sold at $300 per standard *mill*.

West India staves at $75 per *mill* of 1200 pieces.

Michigan Board Pine, 20 inch average, 33 cents; ditto., Red Pine, 55 feet average, 28 cents.

Elm is a drug upon the market, and will not command more than 22 cents.

Walnut, Black, can be had freely at 80 cents per cubic foot for large girths.

Michigan Pine deals, Firsts: $100 per hundred, standard of 27½ feet, or 2,750 feet, board measure. Seconds: Usual proportion and price.

All the above quotations have been carefully selected from the most reliable sources

SHIPBUILDING.

There is little or no reason to hope for a revival in the shipbuilding industry of this port, which a few years ago gave employment to so many thousands of our labouring classes. Mr. Baldwin has just laid the keel of a 800-ton vessel, but this will not give constant employment to more than about 100 men.

Mr. Dior, of France, who is now here in the interest of a proposed new line of steamers between this port and France, believes that the French Government will ere long remove the differential duty upon Canadian built ships. This step, he claims, would give rise to a fresh demand for wooden, Quebec built ships. Our business men do not happily pin much faith to this prospect.

MINING NOTES.

There has been a dearth of interesting intelligence from the Beauce gold mines during the last two months. With the return of spring 1881, operations will be resumed with renewed activity. A damper has of late been cast upon the prosecution of work in this region by the disputes concerning mining rights, given rise to by recent legislation of the Province of Quebec.

In another part of the Province, the shaft of a very promising antimony mine is being put in working order.

The Crown Lands Department of the Local Government will sell by auction this week, a number of valuable timber limits in various parts of the Province. The sale will be held in this city. For some months past there has been a constant demand for small mining locations, which the Crown Lands Department is authorized to sell, to the extent of lots of 400 acres. Mica has recently been discovered at a short distance from Joliette, in paying veins, and only needs the skilful application of a small capital to return a lucrative yield.

It may not be generally known, that an English company has secured 400 acres of land in Charlevoix, containing oxide of iron in abundance, which it is their intention to mine, and ship to England for manufacture

The Local Government has on hand, a scheme for buying phosphates, and distributing them instead of money grants to the various agricultural societies of the Province. This policy will, undoubtedly, by introducing this useful article to the farmers of Quebec, create in the immediate future increased demand for the fertilizer, and thus give an impetus to mining operations. In a future letter, I hope to give more details of the scheme.

FRENCH CAPITAL.

The Credit Financier of Paris, France, opens its agency in the city next January. Five millions of dollars in gold will be at once brought into the Province, to be succeeded by as much more as can be judiciously invested in mortgages at 5 per cent. Whether or not it will prove to be, a undoubted blessing to have our land and buildings mortgaged to a foreign power, I leave others to decide.

Thanks to the energy and enterprise of a liberal minded, and leading business man of the ancient Capital, Quebec is shortly to have in its midst, an important branch of a new industry. The Canada Company is the title adopted by the proprietors of the new undertaking, which will engage in distilling liquors and syrups, liqeurs, acids, perfumes, &c. Some of the products of the new industry, will be upon the market in a few days from present writing.

STADACONA.

PORT HOPE.

This has become an important shipping port, and is the outlet of the vast region north and north-west by the Midland Railway. Our correspondent sends the following statement of shipment to Oswego, for the season up to Oct. 8th, viz: Lumber 62 million feet, pine; value from $8 to $16 per M Barley, 350 000 bu. Iron, ore, 1,200 tons, sent to Fairhaven. Square timber, 500,000 c. feet, rafted for Quebec. In addition to the above, over one and a-half million feet was exported from Port Hope one day this week.

Midland Railway rates to Port Hope for Lumber from Midland, Victoria Harbor, Sturgeon Bay, Waubaushene and Orillia, $1.75 per M., and from Peterboro' and Lindsay, $1.15.

NOVA SCOTIA.

Our correspondent at Parrsboro', a thriving place in Nova Scotia, writes:—"Our prospects here for this season, and first of next, are very good, boards and scantling bringing a good price in the English market at present. Short lumber, such as laths, pickets, and shingles, are in good demand in the United States, at fairly good prices, but the heavy duties against us there prevent us from doing much of any business that way. Next year's prospects, after the Spring sales, are not very encouraging, as there are heavy stocks being put in this winter.

We copy the following items connected with that section:

Messrs. Young & Son, of Parrsboro'—late of Calais, Me.—do the largest lumbering business in the county. They have mills at River Hebert, Apple River, Mose River, and Halfway River; the latter is a steam mill. Most of their lumber is shipped from this port. During the present year, this firm has sent several ship loads to French ports. Amos Lawrence, Esq., of Southampton, also exports a large quantity of lumber from here, and Messrs. Tucker and Adams, of the same place, engage quite extensively in this trade. Lumber is now sent from River Philip, via the I. C. R., to Spring Hill, and thence over the S. H. & P. R. R. for shipment. Add to this the coal brought over this road for home consumption and export, and it is not difficult to see that labourers find plenty of employment during the summer.

Shipbuilding, once the principal industry of this place, has been languishing for some time, and seems to have fairly died out.

NEW STEAM MILL.—Messrs. T. de Wolf, of Port Greville, and B. Annis, of Queen's Co., N.S., have a steam mill in course of erection at Diligent River, about six miles "down shore."

The large tannery, of Messrs. Upham and McCabe, east of the railway station, will soon be completed.

GRAVENHURST.

As a manufacturing and shipping point for sawn lumber, Gravenhurst occupies an important position, being the outlet by railway of the lumber from the Muskoka lakes and tributaries. Considerable trade is also done in tanbark, both for home consumption and export. Large quantities of supplies are going out to that region by the Northern Railway, and as many as fifty horses may be frequently seen in a drove, on the way to the lumber camps in the neighbourhood.

OTTAWA.

The value of sawn lumber exported from Ottawa during the months of May, June, July, Aug. and Sep.. 1877, is given at $859,-616; in 1878 at $686,671; in 1679 at $813,-211. During the year 1880, for May, June, July and August, the value exported is $100,-320. When September returns come to be added, it is expected that the increase over the five months of last year will be in the vicinity of half a million dollars.

TRAFFIC RETURNS.

The traffic receipts of the Midland railway for the week ending October 7th, 1880, were:—Passengers and mails, $2 673.82; freight, $8,468.03; total, $11.141.75. For the corresponding week of 1879:—Passengers and mails, $3,000.39; freight, $7,306.17; total, $10,305.56. Increase for week, $835.29. Aggregate from 1st January, $268.918.68; increase over 1879, $71,087.14.

The receipts of the Great Western Railway in the week ending on the 8th inst., and the corresponding week last year were as follows:—Passengers, $50,450.41; freight and live stock, $69,935.47; mails and sundries, $2,956.63; total, $123.332.51; corresponding week of last year, $102,504.49; increase, $20,838.02.

Receipts of the Whitby, Port Perry and Lindsay railroad in the week ending October 9th were as follows: Passengers, $694.75; freight, $2,169.73; mails and sundries, $63.20; total, $2,927.68, against $2,003.25 in the corresponding week last year, being an increase of $24.43. Total traffic in current year, $67,921.41, against $53,033.36 last year, being an increase of $14,891.05.

Glass Mill-Stones.

The outcome of this successful experiment, we learn from the *Pottery Gazette* was the invention, by the Messrs. Thorn, of the glass mill-stones now made by them, and used in Germany with much satisfaction. Respecting their special merits, we learn, on the same authority, that they grind more easily, and do not heat the flour as much, as is the case with the French burr-stone. In grinding grist they run perfectly cool.

In making these stones the glass is cast in blocks of suitable size and shape, joined with cement in the same way as the French burrs, dressed and furrow cut with picks and pointed hammers. It is suggested that the substitution of diamond dressing machines would give better results.

Without going into the technical points respecting the comparative merits of the old and new mill-stones, which are given at some length, but which would only be appreciated by practical millers, we note simply our contemporary's opinion that, in the event of the success of certain experiments now making on a larger and more important scale than any previous ones, "this discovery will be entitled to rank as one of the most valuable of recent years as regards the milling industry."

AN enterprising sign painter says he would pay liberally for the brush that the "signs of the times" are painted with.

MARINE AND FISHERIES.

Our Salmon Fisheries.

Professor H. Y. Hind has written a letter to the *Forest and Stream*, in which he adverts to the climate question in reference to the late appearance of salmon in our rivers this season, also to "biennial spawners," also to the habit of salmon seeking other rivers than their native streams for sanitary purposes, and to the developement of the hook on the male salmon in *his off spawning year only*. He writes to Mr. Mowat, overseer of Fisheries, and asks to be informed through the columns of the *Miramichi Advance* for reliable information about the catch of salmon in the Bay of Chaleurs "forty years ago." He further says:—I wish to know whether any record or tradition exists respecting the salmon catch in the years 1832; 1835; and 1836, 1841, 1842 and 1852. In fact the record of any particularly good, or any particularly poor year, will be thankfully received. I have prepared a notice of the salmon catch and character of the seasons in certain rivers in Scotland for about one hundred years, and I wish to ascertain whether the experience in New Brunswick bears out certain remarkable relations I have found to exist between extremes of heat and cold in the appearance of certain anadromous fish particularly the salmon.

I should be glad if Mr. Mowat would also state whether he has ever taken or seen large male salmon late in the season without the hook being developed largely on the lower jaw; also, whether he has ever seen or heard of large male salmon, having milt well developed, without the hook on the lower jaw. I should also like to ask him whether he has ever seen any nests of the salmon which he supposes were made in the spring of the year. I have seen such nests at the headwaters of the North West branch of the South West Miramichi. I saw them with transparent eggs in them on the 24th of July, 1864, when I was making the Geological Survey of the Province.

The *Advance* says:—Professor Hind is writing on the Fisheries with a view of having the subject better understood than it now is, not only by the people, but also by the Department at Ottawa, whose knowledge and modes are both susceptible of improvement.

Suicides among Russian Officers.

The number of cases of suicide among the Russian officers in Tashkend, in Asiatic Russian, is increasing to an alarming extent. According to official returns, no fewer than six officers perished by their own hands in one week. Cases of suicide are notoriously common in the Russian army generally, and especially among the troops quartered on the frontier stations. The pay of the Russian officers is small, his promotion is slow, play is everywhere the rule, and drunkenness is common. Except in St. Petersburg and Moscow, no inducement whatsoever is held out to officers to interest themselves in their profession; and even in the above-named towns originality of thought is so discouraged that no officer would venture to express an opinion on any military subject at variance with the views held at headquarters. So little is there to interest, occupy, or amuse, that only a Russian could support the existence led by the officers of the army in country quarters. But if life in a Russian provincial town is dull and colorless, in Taskhend it is a thousand times worse. Often no post arrives for a whole month; there are no amusements; and consequently the unfortunate officer is driven to spend his time in smoking, drinking, card playing, and low intrigues. The result of all this is that a Russian paper rarely appears without announcing the death of an officer who has committed suicide at that post.

THE enormous charges of the British pension list are attracting more than usual attention in the House of Commons. It is stated that in less than a century the descendants of Lord St. Vincent and Lord Rodney have received $1,000,000 each. For nearly two hundred years the heirs of the Duke of Schomberg have drawn a nice income from that grateful country. The Dukes of Marlborough enjoy a perpetual pension of $25,-000 a year. The Duke of Wellington was given $3,500,000 by Parliament to support the dignity of his dukedom, and a pension of $10,000 a year for two generations. These are among some of the larger grants. The smaller ones are numberless, and many of them the rewards of mere favouritism.

Question of Higher Education.

There are few subjects which, in our time, have been worn more thoroughly threadbare than that of education. Unless it be for the behoof of what has been aptly called the "everlasting rising generation," this matter might be allowed to rest. Accepted theories have not been so thoroughly worked as to warrant, one would think, the demand just yet for the trial of new ones—as a matter of fact, we know that there are a great many old-fashioned Conservative sort of folk who are disposed to let well-enough a'one,—and even where they see defects, to rather bear the ills they have than to fly to those they know not of. But this is scarcely the spirit of the age. "Progress" is the watchword of the time. Whether it be backward or forward, or up or down, there must be movement; better to go anywhere than to stand still, and—as the inevitable consequence is supposed to be—be run over. Higher education must not be an exception to this rule. In the general mobilization of everything else this must not, of all things, remain immobile.

Time was when the distinction between a liberal and a professional education was pretty clear. That sort of intellectual training which aimed simply at the full and harmonious development of the faculties of the student was never confounded with that which is specially designed to fit a man for earning his bread. Indeed, it was thought that the farther the "pot-boiling," or as the Germans call it, the "bread-and-butter" idea was kept from the mind of the student engaged in the pursuit of a liberal education, and the more thoroughly he was trained to love study for its own sake, and for the sake of the consciousness of freedom and strength which it imported, the better. Then it was no objection to Latin or Greek that, in all probability, the person learning them would make very little direct use of them after he left College; or to logic, metaphysics, and the higher mathematics, that he was not likely to adopt a profession which would call these branches of knowledge directly into requisition. Then, if the precocious and impatient youngster objected to the lessons which he was required to learn, that he did not see the use of them, it was deemed a sufficient answer that what he knew not then he would know in after years. And it must be admitted that, in this way, some excellent scholars were made, and—which is still more important—some excellent characters were formed.

But, it appears, a more excellent theory has been discovered, and all this is to be changed, or to give place to something better, Latin and Greek if they are not to be altogether discarded are at least to be relegated to the region of the options. Metaphysics is to give place to the physical sciences. In a word, what have heretofore been grouped under the general head of liberal studies, if they are to be retained at all, are to have a subordinate position assigned to them, and education is to be made, in the more materialistic and matter-of-fact sense of the terms, "practical and useful." In the process of effecting this change, an entirely new method of instruction is to be called into requisition. The "object-lesson" is to perform a conspicuous part. Not only are the academy and the Porch to be used as heretofore, but the "grove" and even places less congenial to the feelings of the student are to be brought into prominence as places of instruction. The editor of the *Popular Science Monthly* who is a leader in this reform, or rather, perhaps, this agitation for reform, suggests some measures which probably will appear to many to seem rather radical and even startling innovations. We may mention a few of these.

As a first instalment of what he would like to see introduced into our institutions of learning, he thinks great good both immediate and prospective would result if, for example, the college buildings of the Michigan University, at Ann Arbor, were treated as an object-lesson; and if after this was mastered, the water-supply and sewage system of the town were treated in the same way. After perfecting themselves in these preliminary lessons, he would have the students to systematically extend their studies to the schoolhouses, the poorhouse, and the gaol, with a view to understanding the scientific principles involved in their hygienic, and sanitary conditions and arrangements. Of course he would not have them to end there, but, as we may take for granted, extend their investigations to everything else, either immediately or remotely connected with human welfare. If an object-lesson should be made of the water supply, why not of the food supply? What people eat is quite as important as what they drink. To investigate, with sufficient thoroughness to be of any value to the student in after life, all the sources from which the commisariat of a single city is supplied, opens a pretty wide field, furnishing material for several object-lessons. Then, while man continues to be a clothes-wearing animal, and especially while he continues to be so largely dependent upon clothes, both for his respectability and comfort, there does not seem to be any good reason why the "science of clothes" should not receive its full share of attention.

It may be an evidence of weakness on our part, but we confess, the vastness of the curriculum suggested by Prof. Youmans, in the article referred to, rather appalls us. To say nothing of the mistaken notion of education, which, as we conceive, underlies the whole of this theory, if the mind is to be made a catch-all, which is to be crammed with all sorts of "practical" knowledge, which a gross materialistic utilitarianism may judge to be "useful," and if this be the proper work of schools and colleges, one can scarcely see where the school-days of the coming generation are to end. In fact, if the work is to be done thoroughly, it appears to stretch out, popularly speaking, almost to infinity. Besides, when one thinks of it, to say nothing of the grotesque situations which it suggests, the carrying out of this comprehensive course of instruction would, as it appears to us, be attended with considerable inconvenience.

Think of Dr. McCaul, with his noble staff of co-labourers, for example, leading a few hundred students in a subterranean exploration of the city of Toronto, in order to induct them into the scientific mysteries involved in the sewage system of our good city,—or taking them down for a month to Governor Green's Castle to form a scientific and practical acquaintance with its dietetic hygienic, sanitary, and disciplinary arrangements, and then to have every other institution existing among us subjected to the same process. We hope our educational authorities will make haste slowly in adopting so radical a programme.

Love's Young Dream.

One of the most romantic affairs ever before heard of in this section of the country, says a correspondent at Marion, Ind., first took place here about two weeks ago, and which terminated last night. The substance of the case is as follows: About three miles in the country lives a well-to-do farmer named Fauster, who has in his family a daughter named Sarah D., aged just 14, who is small in stature for her age, and is merely a child. Another old farmer named Pritchett is a close neighbour, who has a son just 13 years of age, who is dubbed as Morton. About two weeks ago these small children planned an elopement, and succeeded in leaving their paternal roof safely. After leaving their homes they walked to Wabash, a distance of twenty miles, where they took the train for White Pigeon, Mich. After arriving there they were united in marriage by the proper persons. The pair then roamed over several towns in the state on their wedding trip, until their finances became short, when they returned home last week and told their respective parents of their adventure. The father of the girl became indignant and brought the girl to the town last Saturday, before 'Squire Timothy, where a warrant was issued charging Morton Pritchett's father with abduction. The case was tried yesterday, when he was acquitted, the girl acknowledging she persuaded the youth to elope with her, and furnished part of the money, the cost of the whole trip being $10.25. While on the trip and after they were married neither occupied the same bed, and no change of clothing was taken along for the occasion. After the trial each returned to their respective homes, where they still remain. The father of the girl will immediately institute proceedings to have the marriage set aside, the plea to be that she was not old enough. The affair has caused considerable interest, and every one who is acquainted with the particulars has taken an interest in the case. During the trial several funny incidents were told by each, which the jammed court room relished with pleasure. The end is not yet, as bad blood is brewing between the two parents.

THE senior Greek professor, in his lecture to the juniors the other day, speaking of the marriage of Venus and Vulcan, remarked that "the handsomest women generally marry the homeliest men," adding grimly; "There's encouragement for a good many of you."

The Use and Abuse of Fiction.

What was said in a former article on the use and the abuse of the theatre, is equally true of the use and abuse of fiction. Indeed these are but different forms of the same thing. What dramatic representation is to the eye, works of fiction are to the imagination. Both are ideal representations of truth, and all that can be said either for or against the one may be said with equal truthfulness for or against the other. From a very early age, mankind have been in the habit of clothing their thoughts, and embodying the truths which they would impart to each other, in the form of fables, allegories, parables, and other forms of ideal representations. Indeed, in the early ages of the world, when books were few, or did not exist at all, the bulk of the wit and wisdom that had been preserved from the past, as well as that which was the product of contemporary genius, was wrapped up in such forms as these. The stories which were told at the fire-side; the songs that were sung, and the ballads and "Sages" which were recited on their festive occasions, were of this sort. Even philosophy and religion were taught in this way. And not a little of the most precious truth that we possess to-day has found its way to us in fictitious forms. Every one knows that the relics of the Hebrew prophets, which came down to our time, abound in these poetic creations. Even the Divine Teacher himself did not shrink from using the parable as an instrument of instruction, and as a means of preserving the truth in the memory of his hearers.

In view of these facts it is worse than useless to assail fiction as such.—Like every other sort of literature, beyond question much of it is bad, and of this we may take occasion to say something at another time. But in saying this, we are only affirming of fiction what may be affirmed, with equal truthfulness, of every other sort of writing. Even into the very best histories the fictitious element enters largely. And this is true of not a few of the biographies which are most widely circulated, and that have the largest number of readers. It is this element, supplied by the imagination of the author, which makes the events, and personages which a writer describes live in the mind of the reader; it is this which gives vividness and reality to a narrative which unenlivened by it would would be so hopelessly dull and stupid, that it would not only be drudgery to read it, but it would make no distinct or lasting impression on the mind of the reader. Take all that is imaginary, dramatic, and practical, from the writing of Macaulay and what would the residuum be worth? Why even the Sabbath-school libraries, furnished by the churches of Christendom, and read by children, are very largely stories which are purely the creations of the imagination. The reason of this is, as the caterers for these libraries tell us, that experience has convinced them, that this is the only sort of books that they can get the bulk of the children and young people to read.

We cannot say that we are altogether pleased with this. One of the abuses of fiction we judge to be the putting it in exciting forms, and in large quantities, into the hands of children or very young persons. There are other faculties which ought to be developed before the imagination. And where the habit is formed early of reading fiction to the exclusion of works which appeal more directly to the understanding and judgment, and call for the exercise of the memory, they induce a careless and hurried mode of reading, which permanently unfits the mind for the sober pursuit of knowledge. Besides, to many young persons, especially to girls of a nervous and excitable temperament, such reading begun early and pursued intemperately, as it is almost sure to be—unless prevented by outside restraint—by keeping the brain in an abnormal and unhealthy state of excitement at a time when quietness is a most essential condition of healthy development—leads to the most disastrous consequences, both physical and mental. Every intelligent physician of large practice, especially such as have made nervous and mental disease a special study, would bear testimony to the truth of this observation. Fiction is to the mind what sweetmeats, relishes and stimulants are to the palate,—taken in limited quantities, along with plainer and less exciting food, it may do good; adopted as a diet to live on, it can only work mischief. A literary friend, a hard student, being asked what he had been reading lately, replied, in our hearing, "I have spent the last few days reading novels. I like occasionally to spend a few days in this way; I find it has an effect upon the mind very much like that which a little good whiskey has upon the body." We have never forgotten the comparison, or the impression which it conveyed, that whatever advantage might be derived from this sort of reading, especially by nervous and excitable young people, was secured at the risk of some evil; and that it ought not to be indulged in therefore without careful limitation and self-restraint.

Some Turkish Intrigues.

Perhaps the most striking fact to a stranger is the little interest Turkish women seem to inspire among the gallant population of Constantinople. But such strangers are, perhaps, unaware of the danger of a word, or even a look; a prolonged gaze into the carriage of *grande dame Turque* may provoke the ire of an attendant eunuch, and cause him to lay about right and left the heavy whip with which he is often provided; but the greatest danger lies in the treacherous encouragement of the *grande dame* herself. Some years ago a M. B——, a young Frenchman of this town, became enamored of one of these veiled Junos, whose soft glance seemed to reveal a reciprocal passion. Day after day he awaited her carriage at a corner of the principal thoroughfare, and, day after day the bewiching eyes drew him carressingly to his doom. Still, no words were exchanged. M. B——became more and more infatuated, and in spite of the warnings of his friends he determined to carry on the intrigue to the end, whatever that might be. Patiently he bided his time and his opportunity, nor were they long in presenting themselves. He was rewarded one day by seeing a tiny jeweled hand drop a billet from the carriage window, which fluttered all unnoticed to his feet. Seizing the paper, the enraptured Frenchman hurriedly deciphered the few words therein inscribed. The lady proposed a meeting for that same evening in the obscure corner of a large cemetery. B——, who had patiently borne the quizzing of his friends, now informed them of the progress of his adventure. He was again warned against pursuing it further; but he laughed at the idea of danger, and, accompanied by a friend, repaired to the rendezvous at the appointed hour. He was presently accosted by a sable servant, exceedingly well dressed, who politely invited him to follow. The two friends turned into a deserted street and arrived at a small door which led through a covered yard to a second entrance. This their guide unlocked, and made a sign for M. B——'s friend to retire. All was silence and darkness around; the servant's black eyes seemed to gleam with malice; and, moved by an undefined fear, the friend again implored M. B——to return. "Bah!" returned this gentleman, "it's too late; besides, what is there to fear when things are managed so easily?" The door closed upon the audacious Frenchman, but the fears of his friends were prophetic—he was never seen by them again. Many attempts were made to learn his fate, and large bribes were freely given for this object. A hint was received that he had been conveyed beyond the frontier, but all traces of him were lost, and no further clue was ever obtained as to his disappearance. One or two such adventures are enough to damp the ardor of the boldest Lovelace, and, unfortunately, other examples have not been wanting.—*Temple Bar.*

REST is never so sweet as after a long struggle; strength is never so strong as through trial; joy is a more blessed thing after sorrow; and the fair dawning of sunny days could never come if we had no night.

A NORTH Carolina man planned to frighten his wife by a sham attempt at suicide. He was to very gently hang himself, and a friend was to cut him down; but the friend was not prompt, and the plotter was choked to death.

"Do you want to kill the child?" exclaimed a gentleman as he saw a boy tip the baby out of its carriage on the walk. "No, not quite," replied the boy; "but if I can get him to bawl loud enough, mother will take care of him while I go and wade in the ditch with Johnnie Bracer!"

DR. HASTINGS, of Boston, in speaking of religious joy, and of singing as being the natural expression of that joy, remarked that some congregations had so little of it that they had to hire people to do their singing. "Why," says he "I would as soon think of hiring a man to eat my breakfast."

Anecdotes of Sharks.

HOW THEY FOLLOWED A DYING SAILOR—A SEVENTY-FOOT FISH—A NARROW ESCAPE.

Some twenty-five years ago, when the writer was returning from China to England, a messmate of his, a young midshipman, hailing from Belfast, was taken ill of dysentry. The poor young fellow battled long with the fell disease, but though he possessed a vigorous constitution, and as brave a heart as any man I ever knew, he could not shake it off. During the last ten days of his illness it had been remarked that a huge shark followed the ship continuously; the ill-omened creature was first seen over the counter, on the same side of the ship where was the cabin in which young H——lay dying, and indeed just below it. Every one saw it; and officers and men had only to lean over the rail, and look long enough, and a dim, shadowy form could be seen moving stealthily deep down in the calm sea. Sometimes it disappeared for hours; and a hope was expressed that it had taken itself off. "But no," said one of the quartermasters, an ancient mariner, who had passed fifty years at sea, "the shark would not leave until it got what it had come for;" and the old salt jerked his head on one side to denote what he meant. The shark became the subject of daily discourse, both in the forecastle and on the quarter-deck, and its appearances were regularly chronicled. Sometimes it rose near the surface, and then it sank low down, and looked more horrible in the deep stillness of the unfathomable sea. All this time the weather remained very calm, and we had scarcely any wind, though at night it sometimes freshened, only to die away in the morning.

At length H——died, after much suffering and a brave struggle against a hard fate. Within a few hours of his death this fine young fellow was buried with all the tokens of respect we could command.

That morning the shark was seen at his accustomed place under the counter, but after the funeral he was seen no more, and no one on board the ship, either forward or aft, could after this gainsay the observation of the old quartermaster: "I 'told you sir, he knew there was a dying man aboard us. Yon'll see no more of him; he's got what he wanted."

Entertaining this view it is not surprising that sailors regard the capture of a shark as an act of retributive justice; for even though the victim that has fallen into their hands may not have feasted on a live or dead seaman—which is extremely unlikely, as they never miss a chance of devouring human flesh—yet they look upon him as the representative of his race, and "serve him out" accordingly.

For several days some sharks had followed a ship off the Brazil coast, and, notwithstanding every effort the crew could not succeed in catching one. At length a shark suddenly made a snatch at the bait, and was soon plunging and lashing his tail in a most furious manner, as he found that he had got more than he bargained for. It was evident that he had taken the hook, and was so far secured, but still he was but half caught, as soon appeared. The men on deck "clapped on" to the line and very soon the creature was alongside, but he plunged and lashed about so furiously that it was found impossible to land him on the deck until he had somewhat exhausted his immense strength. To assist in effecting this the mate proposed to harpoon him, and in the absence of a proper instrument took the boat-hook, to which he attached a line. After a few attempts the mate succeeded in plunging the boat-hook in the fore part of the back, when the shark by a prodigious effort succeeded in snapping the line, and, freeing himself from the hook, made off with the boat-hook sticking like a flagstaff out of his back. He remained in sight some little time, evidently feeling very uneasy, and then disappeared; but whether he succeeded in disengaging himself from this unwonted appendage could not be ascertained.

The shark is so voracious that in pursuing its prey it will leap out of the water, and it also feeds on its own species. It has been said that on cutting open sharks smaller ones have been found inside; for this I cannot vouch from personal observation, though I have seen a very miscellaneous collection of articles extracted from the stomach, such as towels, tooth-brushes, shoes, half a newspapers and a rope's end. The shark will devour anything, and may be regarded as the scavenger of the sea, thus performing the same office as the vultures on land.

The shark produces its young from a sort of egg, the shell of which is brown, and resembles leather; the egg is of oblong shape, with tendrils curling from its corners. When the term of hatching is fulfilled, the end of the case is pushed out by the young shark, which measures seven or eight inches in length. The flesh is seldom eaten, even by sailors whose fare for months has been salt meat; the flavour is unpalatable, and the texture tough and fibrous. The Icelanders use the fat, which can be kept for a long time, in place of lard, and eat it with the prepared fish. The liver affords a good deal of oil, and in Greenland the skin is used for the construction of canoes. Shark's teeth are frequently dug up in fossil remains, and specimens have been found of which the enamelled portion was four and a half inches in length, from whence a geologist has calculated that the shark which owned this tooth must have exceeded seventy feet in length.

In the year 1831 an American ship, named the *Olympus*, anchored off the island of Bourbon, in the Indian Ocean, and some of the sailors obtained permission to go ashore and enjoy a walk after the day's work. Night was coming on, and the quartermaster on duty, tempted to indulge in a bath by the tranquillity of the scene and the delicious coolness of the water, undressed and jumped overboard from the gangway. The quartermaster was a good swimmer, and was soon some distance from the ship, oblivious of danger. But the cook, a negro, who was sitting in the main-chains cooling himself after his hot day's duty, chanced to espy the fin of a shark which was swimming near the surface of the water on the other side of the ship to that on which his shipmate was disporting himself. His first impulse, after making sure what it was (for so large was the size he thought it must be a plank), was to call out and warn him of his danger, but it seemed he wisely determined not to do so lest the news might paralyze him with terror. So he quickly warned some of the sailors, and in little more than two minutes a small dingy suspended at the davits was lowered into the water, and the crew were pulling with might and main toward their comrade, Whether it was that only now the shark caught sight of the man in the water, or the noise of the boat attracted his attention in that direction, the huge fish turned and made toward the quartermaster, who, still unconscious of the fearful danger menacing him, continued to swim away with redoubled energy, as the quick click of the rowlocks warned him of the approach of his shipmates. Reticence would now have been misplaced, as, unless he was rescued within a few seconds, all would be over with him.

"Williams," shouted out the cockswain, "there are sharks near you; be quick—get into the boat, as you value your life."

Apprehending at length the full horror of his position, the quartermaster turned to the little boat, where alone was safety, and being a powerful swimmer, was soon almost alongside. But the shark was upon him. "Quick! quick!" shouted his shipmates, while the bowman, glancing over his shoulder, threw in his oar, and, quick as thought, jumped up, boat-hook in hand, to try and help the struggling seaman.

"Way enough," shouted the coxswain, as the boat, impelled by stout arms, shot shot almost over the quartermaster, who, after a final effort, extended his arms to seize the gunwale of the boat, while two of the crew leaned over the side in order to help him out. But the shark was not to be thus easily balked of its anticipated prey, and as it was near enough to make its venture, darted half out of the water, exposing its prodigious length, and turned over on its side, opening its cavernous jaws. At that moment, when all appeared lost, the bowman, exerting all his strength (and it so happened that he was the most powerful man in the ship), plunged the boat-hook right into the mouth of the animal, which writhing in agony, fell back into the water, and snapped the weapon in two. Turning upon the boat in its fury, it lashed it with its tail with such terrible force that it staved it forward. The sailors had just time to draw in their shipmate, when they they became aware of the new danger menacing all of them. The boat began to fill, when deliverance came from another quarter. Their cries for help (which, owing to the calmness of the evening, were audible a great distance) attracted the attention of the crew of a schooner anchored near the land, who quickly launched their long-boat, and made toward them.

The shark, lashing the water with fury and pain, appeared determined to exact revenge, and remained near the spot, awaiting its prey; but it was again balked, for just as the little dingey was settling fast by the head, the friendly long-boat arrived upon the scene. The crew, with Williams, were taken out of the sinking craft, and were soon on their way back to the ship, rejoicing their escape from a terrible death.

Greek Symbolism.

The decay of pagan belief was not, as Hegel imagines, due to the fact that Hellenic art was anthropomorphic. The gods ceased to be gods not merely because they became too like men, but because they became too like anything definite. If the ibis on the amulet or the owl on the terra cotta represents a more vital belief in the gods than does the Venus of Milo or the Giustiniani Minerva, it is not because the idea of divinity is more compatible with an ugly bird than with a beautiful woman, but because whereas the beautiful woman, exquisitely wrought by a consumate sculptor, occupied the mind of the artist and of the beholder with the idea of her beauty, to the exclusion of all else, the rudely-engraven ibis or the badly-modeled owlet, on the other hand, served merely as a symbol, as the recaller of an idea; the mind did not pause in contemplation of the bird, but wandered off in search of the god; the goggle eyes of the owl and the beak of the ibis were soon forgotten in the contamplation of the vague, ever-transmuted visions of phenomena of sky and light, of semi-human and semi-bestial shapes, of confused, half-embodied forces; in short, of the supernatural. But the human shape did most mischief to the supernatural merely because the human shape was the most absolute, the most distinct of all shapes; a god might be symbolized as a beast, but he could only be portrayed as a man; and if the portrait was correct, then the god was a man, and nothing more. Even the most fantastic among pagan supernatural creatures, those strange monsters who longest kept their original dual nature—the centaurs, satyrs, and tritons—became beneath the chisel of the artist mere abberations from the normal, rare and curious types like certain fairbooth phenomena, but perfectly intelligible and rational; the very Chimæra, she who was to give her name to every sort of unintelligible fancy, became, in the bas-reliefs of the story of Bellerophon, a mere singular mixture between a lion and a dog, and a bird—a cross-breed which happens not to be possible, but which an ancient might well have conceived as adorning some distant zoological collection. How much more rationalized were not the divinities in whom only a peculiar shape of the eye, a certain structure of the leg, or a definite fashion of wearing the hair, remained of their former nature? Learned men, indeed, tell us that we need only to glance at Hera to see that she it at bottom a cow; at Apollo, to recognize that he is but a stag in human shape; or at Zeus, to recognize that he is, in point of fact, a lion. Yet it remains true that we need only walk down the nearest street to meet 10 ordinary men and women who look more like various animals than do any antique divinities, and who can yet never be said to be in really cows, stags, or lions. The same applies to the violent efforts which are constantly being made to show in the Greek and Latin poets a distinct recollection of the cosmic nature of the gods, constructing the very human movements, looks, and dress of the divinities into meteorological phenomena, as has been done even by Mr. Ruskin in his "Queen of the Air," despite his artist's sense, which should have warned him that no artistic figure, like Homer's divinities, can possibly be at the same time a woman and a whirlwind.

She Snubbed Them.

A plainly dressed little lady from San Francisco recently appeared at a California watering place and was snubbed by all the ladies. She sent home for her best dresses and all her diamonds. After her trunks arrived she went to breakfast in a magnificent morning dress made by Worth, profusely ornamented with diamonds, and her two little children were dressed in the height of fashion. Everybody seemed anxious to make amends for past slights, but she was extremely distant to one and all. She cut them in this way for a week, then packed up her nine Saratoga trunks and sent them home, and resumed her plain and comfortable vacation clothes.

A BOY was carrying two pounds of powder and a fuse in a cigar box, at Gibraltar, Pa. The end of the fuse protruded, and a practical joker was at hand to light it. The explosion killed the boy.

SCIENTIFIC GOSSIP.

ONE kind of paper is made in China from the paper mulberry tree bark, and another kind from a mixture of that bark and wheat straw.

THE Syoran and Orenberg Railway bridge across the River Volga, Russia, which is just finished, cost $6,000,000. Where the bridge is built the river is more than a mile wide. The 14 piers which support the girders are 100 feet above the main level of the water, and the girders are 364 feet long and 20 feet wide.

THE date of the earliest eclipse of the sun recorded in the annals of the Chinese, when "on the first day of the last month of Autumn the sun and moon did not meet harmoniously in Fang," or in that part of the heavens defined by two stars in the constellation of the Scorpion, has been determined by Prof. Von Oppolzer, of Vienna, to have been the morning of Oct. 22, 2137 B.C.

M. LORTEL has called the attention of the French Academy of Sciences to a heretofore unnoticed, but an apparently very ancient, station of the stone age. It is situated near Hanaweh, a place not far from Tyre in Syria. A very large number of rudely formed flints, as well as a great many fragments of bone and teeth, are there found in a kind of conglomerate or osseous-breccia.

THE wool crop of the world has increased five times since 1830, when it was about 320,000,000 pounds in weight. In 1878—the latest year for which there are complete figures—Europe produced 740,000,000, River Plate 240,000,000, United States 208,000,000, Australia 350,000,000 and South Africa 48,000,000 pounds, making a total of 1,586,000,000 pounds. Great Britain and France consume each about the same quantity of wool—380,000,000 a year. Germany consumes about 165,000,000 pounds; United States, 250,000,000 pounds, and Russia, Austria, and other countries, 400,000,000 pounds.

THERE are, or have lately been, on exhibition in Glasgow, Scotland, samples of leather prepared with chrome, and without the use of any tanning whatever. It is claimed that the chrome process, invented and patented by a Dr. Heinzerling, is not only cheaper and more expeditious than the usual methods of tanning, but that it produces a leather "stronger, more durable, more pliant, and less pervious to moisture." The chrome-tanned leather exhibited was made into belting, harness, boots, and other articles; and it may be well to suggest that our leather manufacturers should scrutinize what may be learned regarding the results, and if the report is favourable it will go hard with our inventors, but they will better the improvement.

An Edison Romance.

Mr. Edison as the hero of a romance now publishing in a Paris paper, is shown sitting in the workshop at his elegant mansion, wrapped in a black velvet dressing gown with tassels of violet silk. Resting beside him on a velvet cushion is the left hand and arm, just severed from her body, of a beautiful young woman; and near him a powerful electric battery. On the delicate wrist of the young woman's arm is a gold enamel viper, and on her finger a sapphire ring, the hand holding a dainty pearl gray glove. As the story is entitled "The New Eve," it is supposed that Edison is about to create a woman with the arm instead of a rib as a "starter." One of the incidents represents Edison sitting on a bank smoking a choice cigar and watching two trains armed with a new brake of his, designed to stop them instantaneously and without a shock. The engineers becoming excited bungle at the brakes, bringing about a collision in which several hundred are killed. At this, the gifted inventor, throwing away his cigar, impatiently remarks, "Clumsy! stupid!" It is plain that very little is really known about Edison in this country.

A Disappointed Debtor.

The train had started off. A young man rushed breathless in. "Got left, did you?" "Well, ain't I here?" he responded. Then one said he could go across the bridge and catch it, and another told him when the next train would go, and made various suggestions. The chap looked at the disappearing train a few seconds, when somebody asked, "Where were you going?" Then the wicked fellow said, "Oh, I wasn't going in it, but there was a fellow in the train to whom I promised to pay a bill."

The Solid South.

It is said that there is a skeleton in every house. The idea is that there is something in the history of every family that it keeps as carefully concealed as possible, and which it would like to have forgotten. There are such things in nations, as well as in families. The thing that most patriotic Americans would like to have concealed and forgotten, is the thing indicated by the word which stands at the head of this article. That "solid south" is the most ugly fact in the current history of the great American Republic The import of that fact, being interpreted, is, that the unity of the nation is essentially a thing of the past. The South cares no more for the Democrats than it does for the Republicans; it most cordially hates and despises both the one and the other of these. It gives its influence in favour of the former in preference to the latter, simply because such an alliance is the only means by which it can secure its ascendency in the nation, and be once more in a position to redress what it believes to be its wrongs, and to revenge itself upon the hated Yankee. No person can travel in the South without perceiving that a feeling of bitterness against the North, deep and intense, everywhere prevails; and that feeling will never be appeased until all that was done by the war is undone by legislation.

Tho "solid South" means, too, the systematic suppression of the negro vote. Everybody knows, that knows anything about the feeling which prevails among this class of American citizens, that however much they may respect their old masters and their families, they do not trust them. They know too well how deep rooted and strong this aversion is to the very idea of negro equality with them in anything! especially at the polls and before the courts; and they have sagacity enough to perceive that if the white people of the south cannot reduce them again to bondage, they will do all in their power to make their liberty as little worth to them as possible. They know, too, that the party at the north that did all that they could do to fasten their bonds upon them forever, will in the event of its getting into power, do anything that the south may ask them to do, to reduce them again to virtual, if not actual slavery. The negroes know all this, and would not, therefore, if left to themselves to vote as they pleased, cast one vote in a thousand for the Democratic party. In many parts of the south these coloured voters are largely in the ascendency so far as numbers are concerned; and in spite of this fact the the south will remain solid. This fact speaks for itself; comment is unnecessary.

It follows then that democratic government—the term is used in its proper grammatical, not in its party sense—is a failure, at least so far as the south is concerned. The "solid South" proves beyond a doubt that the government is not to be carried on in accordance with the will of the whole people, but according to a part, and that so far as numbers are concerned, the smallest part. It may, indeed, be said that this is as it should be; that the negroes are not fit for self-government; and that the will of the superior class, the class that owns the greater part of the property, and represents the greater part of the intelligence, are the people that should govern. Into the discussion of that question we enter not. Everyone, however, will see that if there be any force in this argument, it is against the form of goverment which exists in the United States, and only tends to strengthen our position. Besides, all that is said of the ignorance and incapacity for self-government of the negroes is equally true of a large proportion of the enormous foreign element, especially in the great cities of the north. There is no argument that can be validly employed in favour of the suppression of the negro vote in the south that would not be equally valid in favour of the disfranchisement of an immense number of voters at the north.

We do not wonder, in view of these facts, that the American people do not like to have so much said about the "solid South." The northern Democrat, for reasons made sufficiently apparent in this article, is ashamed of it, and would rather, if he could, get on without it; and the Republican feels maddened by the fact that the very means which he has devised as a makeweight against the South, is not only neutralized, but turned against him.

THE time that a boy begins to think his mother doesn't know enough to select his clothing for him is a dangerous period in his history.

A Millionaire Criminal.

(London Telegraph.)

Not every criminal who incurs the banishment to Siberia is on that account to be compassionated, if we may believe the accounts of Mr. Juchanzeff's sojourn in exile, recently published by a St. Petersburg journal. This eminent malefactor, known throughout Russia by the significant soubriquet of "The Stealer of Millions," has contrived to retain possession of the enormous fortune he acquired by high-class swindling. When condemned to deportation, he travelled to Krasnojarsk, the town selected for his penal residence by the imperial authorities, in princely style, attended by a suite of servants, carriages and horses, and it would appear that he is to become the leader of fashion in that Siberian city. Tailors, perfumers and tobacconists advertise their wares under his name; he has been elected a member of the leading club, and is about to contract an alliance with a young lady belonging to one of the first families of Krasnojarsk. His dinner parties are attended by the chief official personages and local nobilities; ladies of the best society flock to his evening receptions, and accept the splendid presents with which he judiciously courts their favour and social countenance. It is proposed by a committee of Krasnojarsk "*lionnes*" to present him, upon his wedding day, with a wreath of laurel, oak leaves, and roses. Altogether, for a convicted misdemeanant, undergoing sentence of banishment, he appears to be leading an uncommonly pleasant life. Not so the thousands of his dupes who, having trusted their fortunes to his keeping, suffered total ruin at hishands.

IF you can say nothing good of any one, say nothing at all, for in friendship as in love we are often happier in our ignorance than in our knowledge.

MARKET REPORTS.

CANADIAN LUMBERMAN OFFICE.

Toronto, 14th Oct., 1880.

The stock of lumber on hand in this city at present is low, on account of the recent strike on the Northern Railway. The demand for cars for exports and local traffic, far exceeds the supply. As the season of navigation draws to a close, dealers are anxious to get their lumber away, fearing that rates will rise, which at present may be quoted at $1.25 to $1.50 to Oswego. The latest reports from Oswego indicate that a large stock is on hand there. Sales for the past month have been slow, but the feeling is that prices will improve as the season draws to a close, and sales will be more brisk. The shingle market, both in Oswego and Canada, is lively—the demand exceeding the supply. A number of mills have shut down, as their stock has been cut up. From present appearances, a larger stock will be got out, during the coming winter—the men have gone to the woods earlier, and in greater numbers than usual. A brisk trade all over Western Canada, is anticipated this season. All the railroads are running at their full capacity.

PETROLEUM.

From Petrolia, this week, the crude oil market is reported firm at $2.05 in tank. Refined is quoted at 25 cents in car load lots, with prospects of increase in value. The refineries are running to their utmost capacity to supply the demand. Holders of crude are confident of further appreciation in the value of their product and are holding fast to their stocks. Drillers are at a loss to fill the contracts rushed upon them by the late boom in prices. It has been estimated that during the nine months ending Oct. 1st, there were drilled in the district 325 wells, of which 67 were dry holes.

An Ottawa gentleman has in his possession a fine specimen of silver ore, found about forty miles from that city. He intends shortly taking steps to open up the mine.

FOR SALE, IN THE BEAUTIFUL town of Orillia, a very commodious brick house with out buildings and garden. Terms moderate. Apply to Editor of LUMBERMAN, Toronto.

New and Commodious Brick Building; best north of Toronto; splendid sample rooms: centrally located; free 'bus.

JOHN KELLY, Proprietor.

ST. LAWRENCE HALL.

PORT HOPE.

Is noted for its superior home-like comforts—a well kept table, equalling the best Hotels in Toronto, and large, well-furnished rooms. Good sample rooms on ground floor. Walton Street, Port Hope.

Wm. MACKIE, Proprietor.

ALLANDALE JUNCTION HOTEL.

Travellers by Northern Railway have 15 to 20 minutes by all trains, for refreshments. Solid meals. Tea and coffee at counter. Fine brands of liquors and choice cigars.

E. S. MEEKING Proprietor

QUEEN'S HOTEL.

BRACEBRIDGE.

JOHN HIGGINS, Proprietor. The proprietor (late of Georgetown,) having lately taken possession of the above hotel, will endeavor to make it one of the best houses in the District of Muskoka. Tourists and hunting parties will receive every possible attention. Free 'bus to and from the steamboat wharf. Terms, one dollar per day.

FRASER'S HOTEL.

GRAVENHURST, ONT.

HENRY FRASER, proprietor (successor to Dougland Brown.) Mr. Fraser having purchased and thoroughly renovated and refitted that old established hotel, so long and popularly kept and owned by Dougald Brown, in the village of Gravenhurst, is now in a position to attend to the wants of the travelling and general public. Parties *en route* to the Muskoka District, will find "Fraser's" a comfortable stopping place. The Bar and Larder are well furnished. Convenient Sample Rooms for Commercial Men. Good Stabling and attentive hostler. Free 'bus to and from trains and steamboats.

ST. LOUIS HOTEL.

THE RUSSELL HOTEL CO., Proprietors.

WILLIS RUSSELL, Pres., Quebec.

This hotel, which is unrivalled for size, style and locality in Quebec, is open throughout the year for pleasure and business travel.

HOTEL OTTAWA,

No. 21 North Side King Square.

ST. JOHN, N. B.

E. COSMAN, - - Proprietor.

Terms, $1.00 to $1.50 per day.

THE RUSSELL HOUSE,

OTTAWA,

JAS. A. GOUIN, - - Proprietor.

IS THE

Favourite Resort of the Leading Public men of the Dominion attending the annual Sessions of Parliament.

Ministers of the Crown, Senators, Members of Parliament, Public Officials, as well as those having business with the various Departments of the Government. It is also the head-quarters of those having dealings with the princely Lumber Manufacturers in the great Pine Valley, of which Ottawa is the acknowledged centre.

THE RUSSELL HOUSE being central, almost abutting on the magnificent PARLIAMENT and DEPARTMENTAL BUILDINGS—the pride of the Country—is thus conveniently situated for those visiting the City on public business. But the location is also everything that could be desired alike for the man of business and the man of pleasure. A few minutes walk brings the guest of the Hotel within reach, not only of all the principal business resorts, but also of the most splendid Mountain and Valley Scenery that can be seen anywhere, as also of the two almost unrivalled Waterfalls—the Chaudiere and Rideau—and of the extensive Manufacturing Establishments and Depots of the leading Lumbermen. But, besides the beautiful scenery, which, it may be mentioned, includes the magnificent Ottawa and two of its grand tributaries—the Rideau and the Gatineau—there are in the immediate neighborhood, beautiful Lakes and apparently never-ending woods, which afford opportunities for the finest Fishing and Shooting that can be obtained on the Continent.

THE RUSSELL HOUSE affords excellent accomodation for 300 guests; its table is abundantly supplied with Viands of the choicest description, in season, and nothing is left undone to make every visitor feel comfortably "at home.,"

☞ Omnibusses meet the Arrival of every Train and Boat.

GLASS BALL CASTORS

For FURNITURE, PIANOS, ORGANS, etc., the best and most ornamental Castors in the market. They greatly improve the tone of musical instruments.

RHEUMATISM, NERVOUSNESS, SLEEPLESSNESS cured by insulating beds with them.

Sold by hardware dealers.

Agents wanted.

IN PRESS—TO BE PUBLISHED IN JANUARY, 1881.

LOVELL'S

Gazetteer of British North America.

Containing the latest and most authentic descriptions of over 7,500 Cities, Towns and Villages in the Provinces of Ontario, Quebec, Nova Scotia, New Brunswick, Newfoundland, Prince Edward Island, Manitoba, British Columbia and the North-West Territories, and other general information, drawn from official sources, as to the names, locality, extent, ect., of over 1,800 Lakes and Rivers; a TABLE OF ROUTES, showing the proximity of the Railroad Stations, and Sea Lake and River Ports, to the Cities, Towns, Villages, etc., in the severa. Provinces, (this Table will be found invaluable); and a neat Coloured Map of the Dominion of Canada. Edited by P. A. Crossby, assisted by a corps of Writers. Subscribers' names respectfully solicited. Agents wanted. ☞ PRICE $3—Payable on Delivery.

JOHN LOVELL & SON, Publishers.

Montreal, August, 1880.

DISSOLUTION OF PARTNERSHIP.

THE PARTNERSHIP HEREOFORE existing between GEO. BENGOUGH and WM. DINGMAN, as Machinery Brokers, has this day been dissolved by mutual consent. All accounts will be suited, and the business carried on by Geo. Bengough under the name and style of Wm. Dingman & Co.

GEO BENGOUGH,
WM. DINGMAN,

Witness: ED. E. KING.

MACHINERY!

STEARN'S No. 3 SAW MILL, Log Turner, 68 h.p. Engine. 3 Boilers, dome and heater. This is first class mill outfit, held for bank and will be sold cheap. We have also 2 Iron Lathes and other Machinery. Send for Price List.

WM. DINGMAN & CO.,

56 Front Street East, Toronto.

MIDLAND RAILWAY OF CANADA

AND

Whitby, Port Perry & Lindsay RAILWAY.

NOTICE TO SHIPPERS.

All freight for points on the above roads should be shipped *via* the GRAND TRUNK RAILWAY, when it will be forwarded by the shortest route without transhipment and at the cheapest rates.

Fast Freight Trains Run Through To

Peterborough, Fenelon Falls, Kinmount, Minden, Orillia, Lindsay, Haliburton, Midland, and Waubashene, connecting with fast steamers for Parry Sound and Byng Inlet.

For rates, etc., apply to local agents, or to A. WHITE, General Traffic Agent, Peterborough.

Managing Director W., P. P., and L. Ry.

Great Western Railway

TICKETS to San Francisco and all Points on the Pacific Coast, both Overland and by Pacific Mail Steamships from New York. Winnipeg and the North West by all Routes. London, Detroit, Suspension Bridge, and all the principal points in the UNITED STATES, both east and west, with the fullest information of Routes, with Guidez, Time Tables, Maps, &c., FREE.

SOLE AGENCY FOR THE

WHITE STAR LINE,

To Liverpool, Londonderry, Queenstown, Belfast and Glasgow.

T. W. JONES, Agent,

23 York Sttreet, Toronto, near Queen's Hotel.

OWING TO THE DEATH OF THE LATE JOHN CHAFFEY, Esq., there will be sold by

PRIVATE SALE,

BY HIS EXECUTORS, THOSE

LARGE TIMBER LIMITS

ON THE

SPANISH RIVER,

DISTRICT OF ALGOMA,

belonging to his estate, together with the steam saw mills and other property necessary for a large lumber business.

The timber licenses to be sold consist of part of the township of Sprague, on the Serpent River, and the townships of Salter, May, Hallam, Merrit, Baldwin and Shakespeare, on the Spanish River. These limits are well watered by the Spanish River, which can be driven at all seasons in from three to fourteen days. Supplies can be distributed from the river, which is navigable for 35 miles from the mouth. The quality of pine is well known as being very choice.

The mill property on Aird Island, near the mouth of the Spanish River, is a Post Office on the regular steamboat route from Collingwood. There are two steam mills in working order—capacity two million feet per month; securing booming for 100,000 logs; piling ground for five millions; fronting on water; vessels can load to any depth. Boarding house, store, with chance of good store business, manager's and labourers' horses, store-house, carpenter's shop, blacksmith's shop, Gap lathe for doing repairs.

Other property consists of tug, 16x16 cylinder schooner Snow Bird, booms, 10 tons boom-chain, horses' harness, sleighs, all plant for doing a large lumber business.

Farm, 1,200 acres, on river, 140 cleared and a meadow, two large barns and implements for farming, The above property will be sold *en bloc*. A party is at Spanish River Mills to show the limit to intending purchasers.

Address

A. E. RICHARDS,
Executor,
Brockville.

PUBLIC NOTICE.

ALL PERSONS NOW SQUATTED upon any Public Lands within the Nipissing Crown Land Agency are hereby requested to apply without delay to John S. Scarlett, Esquire, Crown Land Agent at Nipissing, and have their locations carried out in due form, failing which their claims cannot be recognized by the Department.

THOS. H. JOHNSON,
Assistant Commissioner.

Department of Crown Lands,
Toronto, 13th Oct., 1880.

TIMBER LIMITS

AND

SAW MILL FOR SALE!

The following timber limits held by the Montreal Lumber Company, in the Province of Quebec, are hereby offered for sale, viz:

1. Limits on and near the River Maskinonge, as follows:

	Sq. Miles.
Maskinonge No. 1 east	25
Maskinonge No. 2 east	50
Maskinonge No. 3 east	44
Maskinonge No. 1 west	49
Rear Riviere du Loup Nos, 1, 2, 3	46
Peterborough east	34
Peterborough and Brandon	19
Total	270

2. Limits on the River St. Maurice and its tributaries, viz:

St. Maurice No. 3 east south half	19
Rat River No. 2 north	40
Rat River No, 2 south	40
Rat River No. 3	50
Vermillion No. 2 south	42
Vermillion No. 3 south-west half	28
Ve million No. 4 south-east half	25
Paheloganing west	40
Total	284

With the Maskinonge limits there is a saw mill run by water and steam power, in perfect running order, with dwelling house, office and stables, and about ten acres of land at the village of Maskinonge Bridge, and a piling ground of about ten acres at the mouth of the river.

The St. Maurice limits are rich in pine, and are reported to be the best in the St. Maurice territory. The timber on the Maskinonge limits is chiefly spruce.

The whole property is most conveniently situated for the shipment of lumber to the American market. For further particulars apply to

JOHN FAIR,
Sec. Montreal Lumber Co., Montreal.

BUY ONLY THE BEST!

PIM'S

ROYAL PRINTOGRAPH

THE KING COPYING TABLE.

Always takes the lead.

Over 400 copies have been printed from one writing.

PRIZES AWARDED FOR SUPERIOR MERIT

The only Diploma given by the Industrial Exhibition Association of Toronto, for "Copying Tablets," was awarded to us for our "Improved Copying Tablets," with black and coloured inks.

We also received a Special Prize at the Provincial Exhibition at Hamilton, and also an Extra Prize for our very "Superior Copying Inks," for use on the Printograph or other Copying Tablets.

GREAT IMPROVEMENTS,

NEW FEATURES,

BLACK AND COLOURED INKS,

AND A

SPECIAL PENCIL.

Also a Special Copying Ink for use on Rubber-Stamps.

EVERY PRINTOGRAPH IS WARRANTED.

PRICES REDUCED

Printographs, $1.00 and upwards, according to size. Inks, 25 cents per bottle. Copying Pencil, 20 cents each. Our manufactures can be sent to any address on receipt of price.

PIM & CO.,

Manufacturers, 61 King Street East, Toronto.

CAUTION—As there are worthless imitations being sold under different names the public are cautioned against buying any but "Pim's Royal Printograph" as none but those bearing our name are genuine.

FINDING FRANKLIN.

Extracts from the Account of Schwatka's Search.

Thrilling Story of His Sledge Journey Over Arctic Snows.

DEPOT ISLAND, NORTH HUDSON'S BAY, August 1, 1880.

It is just two years since Lieut. Schwatka's Franklin search party landed at Camp Daly, on the adjacent mainland, and during this period its experience has been, I believe, sufficiently varied and novel to make an interesting chapter in Arctic history. We had been informed in New York that a Netchilik Esquimaux had given Captain Thomas F. Barry, when second officer of the whaler Glacier, then wintering in Repulse Bay, a spoon which proved to have been the property of Sir John Franklin; that subsequently when Barry, while second mate of the A. Haughton, was writing in his logbook he overheard the native who had given him the spoon in conversation with another Netchilik say that the spoon came from a cairn where there were many such articles, besides books, similar to the one that Barry was writing in at the time; that Barry then questioned them, procuring a reiteration of the statement, and that the books were probably still there, as Inuits had no use for them, and would not disturb them. They also expressed their willingness to guide a party of white men to the cairn. A chart was shown and explained to them, and they pointed out King William Land as the country where the cairn could be found. The natural inference was that that the books that they saw in a cairn with silverware and other articles from the Erebus and Terror were probably the records of Franklin's expedition, and the information seemed sufficiently direct and reliable to warrant the organization of the Franklin search party of 1878, 1879, and 1880. It took some time after reaching Hudson's Bay to sift these statements and find them wholly devoid of truth. But gradually they all fell to the ground, piece by piece, until nothing was left but the bare fact that he had a Franklin spoon in his possession when he reached the United States at the conclusion of his voyage in the Glacier, in the year 1873.

AN INTERESTING SPECTACLE.

We witnessed a most peculiar and interesting spectacle on the 8th, in what appeared to be a frozen waterfall, about twenty-five feet in height, where a branch seemed to flow into the Lorillard from the west. At a distance it looked like a mountain torrent which had been arrested in its progress by some mighty hand and transformed into stone. Its ripples of crystal gleamed in the sunlight and sparkled as if studded with myriads of gems. After enjoying its varied beauties for some time I climbed to the top of the bank to make a closer inspection of it. Tracing its course for a short distance from the shore I found a shallow brook which had frozen in a level place at the top of the hill, forcing the water to the right and left until it spread in a thin sheet over the face of the rock for the space of about fifty feet in breadth. Successive layers of ice were thus formed and this novel and beautiful effect produced. The first few days of our journey were excessively fatiguing. The sleds were heavy, and we often had to put on our harness to help the dogs over a ridge or through a deep drift. We had not yet become hardened, and consequently experienced much difficulty from blistered feet and chafing, but as we got rid of our superfluous flesh these petty troubles became less annoying and we did not so easily become fatigued from walking.

THE OLD MAN'S STORY OF WHITE MEN.

From Ikinnelikpatolok, the old Ookjoolik, we learned at the interview that he only once before saw white men alive. That was when he was a little boy. He is now 65 or 70. He was fishing on Back's River when they came along in a boat and shook hands with him. There were ten men. The leader was called "Tos-ard-e-roak," which Joe says from the sound he thinks means Lieut. Back. The next white man he saw was dead in a bunk of a big ship which was frozen in the ice near an island about five miles due west of Grand Point, on Adelaide Peninsula. They had to walk out about three miles on smooth ice to reach the ship. He said that his son, who was present, a man about 35 years old, was then about like a child he pointed out, that is, probably 7 or 8 years old. About this time he saw the tracks of white men on the main land. When we first saw them there were four and afterwards only three. This was when the spring snows were falling. When his people saw the ship so long without any one around they used to go on board and steal pieces of wood and iron. They did not know how to get inside by the doors, and cut a hole in the side of the ship on a level with the ice, so that when the ice broke up during the following summer, the ship filled and sunk. No tracks were seen in the salt water ice or on the ship, which also was covered with snow, but they saw scrapings and sweepings alongside, which seemed to have been brushed off by people who had been living on board. They found some red cans of fresh meat, with plenty of what looked like tallow mixed with it. A great many had been opened, and four were still unopened. They saw no bread. They found plenty of knives, forks, spoons, pans, cups and plates on board, and afterwards found a few such things on shore after the vessel had gone down. They also saw books on board, and left them there. They only took knives, forks, spoons and pans; the other things they had no use for. He never saw or heard of the white men's cairn on Adelaide Peninsula.

THE LOST EXPLORERS.

Ahlangyah pointed out the eastern coast of Washington Bay as the spot where she, in company with her husband and two other men with their wives, had seen ten white men dragging a sledge with a boat on it many years ago. There was another Inuit with them, who did not go near the white men. The sledge was on the ice and a wide crack separated them from the white men at the interview. The women went on shore and the men awaited the white people on the track on the ice. Five of the white men put up a tent on the shore and five remained with the boat on the ice. The Inuits put up a tent not far from the white men and they stayed together here five days. During this time the Inuits killed a number of seals on the ice and gave them to the white men. They gave her husband a chopping knife. He was the one who had the most intercourse with the white crew. The knife is now lost or broken and worn out. She has not seen it for a long time. At the end of five days they all started for Adelaide Peninsula, fearing that the ice, which was very rotten, might not let them across. They started at night, because then, the sun being low, the ice would be a little frozen, The white men followed, dragging their heavy sledge and boat, and could not cross the rotten ice as fast as the Inuits, who halted and waited for them at Gladman's Point. The Inuits could not cross to the mainland; the ice was too rotten, and they remained in King William Land all summer. They never saw the white men again, though they waited at Gladman Point fishing in the neighbouring lakes, going back and forth between the shore and lakes nearly all summer, and then went to the eastern shore, near Matty Island. Some of the white men were very thin, and their mouths were dry and hard and black. They had no fur clothing on. When asked if she remembered what names any of the white men were called she said one of them was called "Algoocar" and another "Toolooah." The latter seemed to be the chief, and it was he who gave the chopping knife to her husband. (Agloocar and Toolooah are both common Esquimaux names, and it is probable that the names she heard the white men called resembled these in sound, and thus impressed themselves upon her mind. Another one was called "Dok-took" (doctor). "Toolooah" was a little older than the others and had a large black beard mixed with gray. He was bigger than any of the others—"a big, broad man." "Agloocar" was smaller and had a brown beard about four or five inches below his chin (motioning with her hand.) "Dok-took" was a short man with a big stomach and red beard, about the same length as "Agloocar's." All three wore spectacles, not snow goggles, but as the interpreters said, all the same seko (ice).

DEAD BODIES IN A TENT.

The following spring when there was little snow on the ground, she saw a tent standing on the shore at the head of Terror Bay. There were dead bodies in the tent and outside were some covered over with sand. There was no flesh on them—nothing but the bones and clothes. There was a great many; she had forgotten how many. Indeed, Inuits have little idea of numbers beyond "ten." She saw nothing to indicate any of the party she met before. The bones had the cords or sinews still attached to them. One of the bodies had the flesh on, but this one's stomach was gone. There was one or two graves outside. They did not open the graves at this time; saw a great many things lying around. They were knives, forks, spoons, watches, many books, clothing, blankets, and such things. The books were not taken notice of. This was the same party of Esquimaux who had met the white men the year before, and they were the first who saw the tent and graves. They had been in King William Land ever since they saw the white men until they found the tent place.

Drinks in Every Style.

An English physician, Dr. Shorthouse, has been making an interesting series of observations on the manner in which various drinks act on different parts of the cerebro-spinal system which preside over locomotion. He says, according to *The British Medical Journal*, that "if a man partake of too large a quantity of good sound wine or malt liquor he usually staggers about from side to side, his gait is very unsteady, and if he come to grief and to mother earth he generally falls on one side or the other. If he take too much whisky, especially that abomination which goes by the name of Irish whisky, he is almost certain to be seized with an irresistible impulse to fall forward on his face. If he get drunk on cider or perry, the latter more especially, he is certain to fall down suddenly on his back, and apparently without any previous warning. He once saw a number of men, who had made too merry at a harvest feast, all fall down upon their backs, get up again, and fall down again in the same manner. He had never witnessed anything of the kind before, and was not a little amazed as well as amused. The farmer, who was a very shrewd Herefordshire man, told him that that was the effect invariably produced by perry, of which his men had that day partaken liberally. He has since that time seen several isolated cases which have corroborated the farmer's version of the action of an overdose of perry or cider." Dr. Shorthouse's researches, unhappily, have not been conducted with sufficient precision, nor have they extended over a sufficiently wide field. American investigators could have informed him that not only do different drinks affect men in various ways, but the effects differ according to the quantity of beverage imbibed. Thus, while four fingers of the whisky peculiar to cheap saloons will cause the subject violently to invert other people, a dose of fourteen fingers will lead him peacefully to invert himself. The gin of similar resorts, which is not distinguishable from the ordinary turpentine of commerce, produces pedal entanglements and precipitation upon the bridge of the nose, a fact observed by the psalmist, who made allusion to the relations of the feet to the gin, The rum of these places invariably induces pedestrian exercise upon the ear, the white Medford variety leading the subject invariably to walk off upon his left ear, while old Jamaica as invariably inspires his right ear with locomotive powers. The brandy of these resorts is as instantaneous and overwhelming in its effects as a thunderbolt, and the victim who partakes of it at once sinks down on every portion of himself simultaneously. As for the wines, their action is quite different. Instead of flooring the subject, they impel him to wander over the face of the earth and never sit or fall down, though his path be strewn with banana-peels and lie along string-pieces of docks. Altogether, Dr. Shorthouse can find a far more fertile field for investigation in these United States than is open to him in England, even without making inquiry into the more abstruse and complicated beverages of the great west, like the far-famed shepherd's delight of Nevada, one drink of which fascinating fluid moves the assimilator to steal his own sheep and hide them in the remote sage-brush from his own pursuit.

As the accounts from the terrible wreck of the steamer City of Vera Cruz come in more fully, they become highly exciting and interesting. A seaman, named Ibbot, who swam ashore on the Florida coast, after having been seven hours in the water, has given a brief but very graphic account of his experiences, which recalls the most horrible passages of marine novels. No such wreck has occurred on the American coast since the loss of the Evening Star in 1866.

MR. ARCHIBALD FORBES can claim the new South African medal and clasp, as he conveyed the news of the victory at Ulundi to Sir Garnet Wolseley and Sir Bartle Frere.

DOMESTIC RECIPES.

TO CLEAN ZINC.—Put on the zinc a little sulphuric acid and rub over with a cloth so that every part is wet. Afterward wash off with clear water, and then the zinc will be bright and clear.

SUGAR COOKIES.—One cup of butter, three eggs, one cup of sugar, one teaspoonful of baking powder sifted into flour; enough flour to roll out thin. Flavour with lemon, vanilla, or nutmeg.

GINGER SNAPS.—One cup of molasses, one cup of shortening, one cup of brown sugar, one tablespoonful of soda, one-half cup of boiling water, two tablespoonfuls of ginger. Mix stiff and bake in a quick oven.

CLOVE CAKE.—One cup of sugar, one of molasses, one of milk, one of lard, one of raisins, one teaspoonful of cloves, one of cinnamon, two of baking powder, two eggs; flour to thicken about as ginger-bread.

MOUNTAIN CAKE.—One pound of flour, one of sugar, one-half of butter, one cup of sweet milk, six eggs; beat whites separately, two teaspoonfuls of baking powder. Bake as jelly cake, with icing instead of jelly.

CHILI SAUCE.—One dozen large-sized onions, twenty-four ripe tomatoes, four teaspoonfuls of salt, eight of sugar, three of ground cloves, four of cinnamon, two of ginger, one of ground black pepper, two of mustard, two and one-half cups of vinegar. Chop tomatoes and onions fine, add spices; boil two and a half hours. Add vinegar, hot, after the ingredients have boiled one hour.

PICKLED PEACHES.—Take fine free-stone peaches, rub with a woollen cloth to remove the down, and put into a brine made of one-half cup of salt to a gallon of water—it should be cold—and let stand nine days. Then wipe them dry, pack in a jar, and cover with cold vinegar (spiced if you choose). When wanted for table halve them, removing the stone, and sprinkle with sugar. I think them very nice.

TOMATO CATSUP.—Scald and run through a sieve half a bushel of tomatoes. Add three tablespoonfuls of salt, one tablespoonful of red pepper and one of black pepper, three tablespoonfuls of mustard, two of cloves, one of allspice, one pint of vinegar, two green peppers and two onions chopped fine. Put cloves, allspice, peppers and onions in a muslin bag; put all in a kettle and simmer four hours, or until as thick as desired.

CIDER JELLY FOR THE SICK.—One pint of clear sweet cider, one package of Cox's gelatine, two pounds of white sugar, one pint of cold water, one quart of boiling water, juice of two lemons and the grated rind of one. The gelatine must be soaked in the cold water one hour. To this add the sugar, pour over it the boiling water, stir until dissolved, pour in the cider, strain through a flannel bag, wet your glasses or molds in cold water, pour in the jelly, and set away to cool; make several hours before wanted for use. This also makes a very nice dessert for persons in health.

CANNING TOMATOES.—Fifteen years' experience in canning tomatoes has taught me a few things which, perhaps, the ladies of the *Rural* would like to know. First,—the tomatoes should not be over-ripe; they should be firm enough to pare with a sharp knife, and should not remain off the vines over-night before being used. Do not scald them to get the paring off, as that alone will help to start fermentation. I always select for canning those that are yet green near the stem. Boil until heated thoroughly through; turn into any good self sealing glass (I prefer the little Mason); screw down the lid as tightly as you possibly can immediately, and if, when cold, you can tighten it more, do so. Set in your cellar and keep from the light, and your tomatoes will come out as fresh in January as when put in.

TO COLOUR BUTTER.—The bought colouring matter that I have used for several winters, I have always mixed in with the cream just before churning. The past spring when complaining to a friend that while we had beautiful golden butter, our buttermilk was so yellow that we did not care to drink it or use it for cooking purposes, she asked why we mixed it with the cream at all? Why not colour the salt? I must confess I had never thought of this before, but since I have tried it, I see no reason for returning to my old method. The deepness of colour of the salt must depend upon the lack of colour in the butter. Thoroughly incorporate it with the butter—it does not show the colour at once—let stand over night and, in the morning, just work it through before packing or making into prints.

Bee Notes for October.

From the American Agriculturist.

THE HONEY CROP.—The yield of honey from Basswood and other sources, in this section, has not equalled our expectations. During the last days of June the supply of honey, from basswood, promised to be abundant, but it was very suddenly and unexpectedly cut short. Reports from all parts of the United States indicate a small crop. We judge it to be less than one-half of the usual average; many report an entire failure. In our own apiaries we secure over 15,000 pounds from 176 colonies. Thus far we have taken from three selected swarms as follows: July 10th, No. 1, 77¼ lbs., No. 2, 66½ lbs., No. 3, 83¾ lbs.; July 13th, No. 1, 41 lbs., No. 2, 41 lbs., No. 3, 55 lbs.; July 19th, No. 1, 12 lbs., No. 2, 18 lbs., No. 3, 18 lbs. After the last date given we removed the swarms, with others, to where Buckwheat, Golden Rod. and Eupatorium are found in greater abundance than around the summer stands nearer home.

FALL PASTURAGE.—The subject of fall pasturage is of considerable importance, as, with a fair yield of honey at this season, breeding will be continued, and thus one of the essentials for successful wintering is secured. It will therefore be found profitable to study the sources from which a yield may be expected. In many sections buckwheat is the chief dependence for late honey. In other localities, like our own in the Mohawk Valley, Melilot or Sweet Clover, is of great importance. But more generally, we think that the supply will be gathered chiefly from Golden Rod and Eupatorium. These wild plants can be found upon rough, waste land, in nearly all parts of the country.

FALL MANAGEMENT. — If surplus boxes have not been moved as directed last month, it should be attended to at once. If swarms have been supplied with extra combs for extracting, they should be removed and packed safely away for use another season. The value of these combs, as well as those taken from piece boxes, cannot be overestimated, consequently great care should be taken to perserve them. Mice and rats should be carefully excluded. If disturbed by the destructive moth, the removed combs should be smoked with brimstone.

QUESTIONS AND ANSWERS.

HANGING AND STANDING FRAMES.—"Do you not crush more bees, and are you not more liable to kill the queen with the Quinby standing frame, than with the hanging frame?"—We consider the standing frame quite as desirable, yet we, as well as others, in answering such questions, should not lose sight of the fact, that every bee-keeper becomes more familiar with whatever style of hive he adopts, and, naturally, can handle it better than any other, until he acquires a large experience.

OPENING HIVES. — "How often should a beginner open his hives?"—Just as often as practical operations requires him to do so.

BEES IN A GARRET.—A correspondent in N. J. comes with the old question of the desirability of keeping bees in a garret. This story of arranging bees in a room in a garret where they will not swarm, and where the owner can go and cut out cards of honey for family use, at any time, is a very old one, and the immense swarm of bees somewhere in the rocks, where bees pour forth in masses, and honey may be found by the ton. As regards keeping bees in an attic or upper room, or even upon a roof they may be so kept, if some practical hive is properly arranged in such a location. There are even some advantages derived, where but few hives are kept. But all things taken into consideration, it is preferable to have the bees placed somewhere near the ground.

Cradles.

The following wise suggestion is from the Herald of Health.

Fortunately for children, cradles are seen more and more rarely in all families, and we are decidedly of the opinion that these soothing machines, once so popular, will soon have only a historic interest, like the spinning wheel. Still there are here and there mothers who advocate the cradle, and for such we have a word of advice. In the first place the rocking motion to which the child is subjected causes an unnatural circulation of the blood in the brain, which tends in the end to produce a state of unnatural excitability. Now if this takes place several times a day, and these motions of the cradle are carried to excess with restless and wakeful children, it is clear to our mind that the effects can only be injurious, especially when we remember the fact that children once accustomed to it are often treated with it for years. Cases are not rare of serious injury to the circulation of the brain, from violent rocking given to the infants when intrusted to nurses or ignorant children. It is not difficult with a little patience to treat an infant so that as soon as the time for sleeping approaches, he will go to sleep in his little bed without any artificial aid. If the beginning has been made, and if the mother has not been softened by the disagreeable crying of the child to rock it to sleep in the cradle or in her arms, it will be found after a few days, how quickly the child likes to go to sleep alone without the affliction of popular remedies of mothers. Many mothers will not believe this true until they have tried it and learned from experience. Although the child may cry at first, it soon learns to go to sleep quietly, and the mother has the additional advantage of gaining valuable time for rest from her domestic duties. Why does a healthy baby need rocking, more than a bird a colt, or a calf?

Talk Over What You Read.

Nearly forty years' experience as a teacher has shown how little I know of a subject until I begin to explain it or teach it. Let any young person try the experiment of giving in conversation, briefly and connectedly and in the simplest language, the chief points of any book or article he has read, and he will at once see what I mean. The gaps that are likely to appear in the knowledge that he felt was his own will no doubt be very surprising. I know of no training superior to this in utilizing one's reading, in strengthening the memory and in forming habits of clear, connected statement. It will doubtless teach other things than those I have mentioned, which the persons who honestly make the experiment will find out for themselves. Children who read can be encouraged to give, in a familiar way, the interesting parts of the books they have read with great advantage to all concerned. More than one youth I know has laid the foundation of intellectual tastes in a New England family, where hearty encouragement was given to children and adults in their attempts to sketch the lectures they had heard the evening previous. The same thing was done with books.

A MAN asleep at the top of a telegraph pole was a recent spectacle in Boston. He was a drunken repairer, who had grown drowsy at his work. A great crowd gathered, but nothing was done to arouse him, and he finally awoke in safety.

DR. DE VRY, of the Hague, has been made Companion of the Order of the Indian Empire by the Queen for his services in the introduction of the cinchono-tree into India, and in the manufacture of quinine there; and Dr. James Prescott Youle has received the Albert Medal from the Society of Arts for establishing, after "most laborious research, the true relation between heat, electricity, and mechanical work, thus affording the engineer a sure guide in the application to science and industrial pursuits."

Telegraph Blunders.

A gentleman who had gone to the country to find a summer location for his family telegraphed to his wife, "Home to-night." The wires rendered this into "Come to-night," and so the wife posted into the country at once, while her husband was making his way in a contrary direction.

Not long since a message came to the principal of a business house in the city from his travelling agent, who had reached Philadelphia—"Am at Continental House. Send some hash by mail." The agent did not intend to reflect on the food at the hotel, but wanted "cash" sent by mail.

An affectionate uncle was informed by telegraph: "Mary is to be buried on Wednesday. Come sure." Mary, who lived in Chicago, was his favourite niece, and, as he had not heard of her illness, the sad intelligence gave him a severe shock. He dressed himself in deep mourning, and made a hurried journey to the West to find a jovial party at Mary's wedding. The wires had arranged for her to be "buried" instead of "married."

Probably the worst blunder ever made was one that occurred in the case of a St. Louis merchant, who, while in New York, received a telegram informing him that his wife was ill. He sent a message to his family doctor, asking the nature of the sickness and if there was any danger, and received promptly the answer: "No danger. Your wife has had a child. If we can keep her from having another to-night she will do well." The mystification of the agitated husband was not removed until a second inquiry revealed the fact that this indisposed lady had had a "chill."

A Terrible Punishment.

Pontre Molli, Italy, can boast of a lady Abbess and reverend coadjutors whose Spartan discipline goes even beyond that of CANNING'S renowned Mother Brownrigg, "who whipped two female 'prentices to death and hid them in a coal-hole," A lay servant having been detected in stealing some bread, my Lady Abbess and two senior nuns held an impromptu tribunal and condemned her "to undergo the torments of purgatory." Most of us probably have entertained but vague notions as the nature of those torments, and will therefore learn with the more interest what are an Abbess's ideas on the point. The reverend Mother and Sisters having conveyed the delinquent to a cell where there was a stove, tied her hands securely, and then held her face to the hot metal until her eyes had lost their sight and her face was one huge blister. Some of the nuns, however, thought this discipline somewhat too stringent, and, possibly on the principle that "a fellow feeling makes us wondrous kind," and with the reflection that there was no saying but that the Lady Abbess might "go for" them next, communicated with the authorities, who have placed these severe disciplinarians in jail pending a trial.

A Grand Trade.

An old Glasgow bookseller used to give a humorous account of what was in his days an almost daily occurrence:—"Indeed," he would say, "it's but a poor trade the selling of stationery. A muckle stupit simph comes into the shop, and says, 'Gie's a bawbee's worth o' paper.' 'Is is post ye want?' 'Oh, yes.' 'Bless me, man, dae ye want short or lang!' 'Ah, no; I'll tak this ane, for it's biggest.' Well, ye wad think ane was done wi' the fallow after a' that fash, and mair nor five or ten minutes lost: but no—he's at ye yet. 'Mend that pen,' he says, handing out an auld stump to ye that naebody almost could men'; and when ye hae dun that, he follows it wi' 'Pit a wee drap ink in that bottle.' Ye pit some in in his bottle a' for naething, and syne he shoves out his great horny hand, and says, 'I'll thank ye for a wafer.' Now only think o' the fasheeerie, sic a loss o' time, forbye the ink and the wafer for naething! Ye'll see that the stationery trade's a grand trade."

THE natives of the Orkney Islands are said to enjoy good health and to live long. For these blessings they are indebted entirely to the bracing climate and to their own healthy outdoor occupations. A young woman from one of these islands was asked lately whether her people were generally long livers. With unconscious naivete she replied, "Yes, they live to a great age; there's no doctor on the island."

GENERAL.

PHYSIC.—A witty old physician being asked by a beautiful girl what good all his doctor stuff did people, answered: "Why you see, my dear, by my pills, and powders, and blisters I distract the patient's attention, while nature cuts in and cures the disease before he knows it.'

IT has been estimated that of the horses in the world Austria has 1,367,000; Hungary, 2,179,000; France, about 3,000,000; Russia, 21,470,000; Germany, 3,352,000; Great Britain and Ireland, 2,255,000; Turkey, about 1,000 000; the United States, 9,504,000; the Argentine Republic, 4,000,000; Canada, 2,634,000; Uruguay, 1,600,000.

The Fiji Islanders who, up to six years ago, when England adopted them were cannibals, and indulged in fricassed traders, with cold missionary on the sideboard, have become so civilized that they wear clean shirts on Sunday, sing hymns, eat yams and beefsteak like any orthodox Christian. What with cocoanut, cocoanut fibre, cotton, sugar and coffee to export, and a luxuriant soil to grow all these products in, the colony ought to have a grand future.

THE oldest infantry regiment in the Austrian army celebrated, on the 21st of last month, the 250th anniversary of its enrollment. It bears the name of "Prince George of Saxony, No. 11," and was raised in Bohemia in 1630, during the "Thirty Years' War." The regiment is at present quartered in Herzegovina. The day was celebrated by a grand banquet given by the officers, while the soldiers had a sort of historical masquerade, illustrating the career of the regiment.

On Saturday night Carter, the negro minstrel, who was performing in one of the big Bowery variety theatres, provoked long and loud applause with his newest story. "I was in Washington the other day," said he, "and I met an old politician there who asked me how things were in New York. I told him that a Pennsylvania man is in a peculiar fix there. He asked how that was, and I said that the man I referred to is on the Island, and is going to be sent up for four years in November."

AFTER the execution of Meneselou in Paris the other day for the murder of the little girl, Lusie Deu, his remains were conveyed to the anatomical theatre, and subjected to a singular experiment. Dr. Sapdey injected under the cutaneous tissue of the head some fresh-drawn blood from the carotid of a living dog. The result was startling, for the colour returned to the cheeks, there was a perceptible nervous tremour, while the lips slightly moved. The same treatment applied to the body produced no effect.

THE champion jack-of-all-trades belongs to England, and lives near Chichester. He has served as seaman in the four quarters of the globe, and acted as steward, sailmaker, cook, mate, and navigator. He now hangs out his sign as "Prof. Pullinger, contractor, inventor, fisherman, builder, carpenter, joiner, sawyer, undertaker, turner, cooper, painter, glazier, sign painter, wooden pump-maker, paper hanger, bell hanger, boat builder, clock cleaner, locksmith, umbrella repairer, china and glass mender, netknitter, wireworker, grocer, baker, farmer, taxidermist, copying clerk, letter writer, accountant, surveyor, engineer, land measurer, house agent, vestry clerk, assistant overseer, clerk to the Selsay Sparrow Club, clerk to the Selsay police, assessor and collecter of land tax and property and income tax, and collector of church and highway rates."

A STRIKING acoustic effect has been produced at the Covent Garden Theatre concerts, London, by locating one of the bands in the front seats of the top gallery, while the other two perform on the temporary orchestral stand erected for the promenade concerts. The instruments during the realization of this novel idea were drums and bugles to the extent of over a hundred performers, and the players, under the direction of a inventive Frenchman replied to each other from floor and gallery in a kind of ancient antiphonal call and recall, with all the vehemence of military lungs and arms, going it hard at brass and goatskin. The rapid and almost startling transitions from half stillness to thunder were very strange, and as the sound rolled and reverberated along the roof, and up and down the ample building, such a clatter and uproar was produced has been rarely equalled. The effect was remarkable, and the critics say the thing was sublime.

NET ASSETS, JAN. 1, 1879 **$23,761,342.**

ÆTNA LIFE

INT'REST RECEIVED, 1879 **$1,856,710.**

RATE PER CENT., **7.81**

That the above is a most satisfactory and profitable rate of interest will be conceded by all. But the careful attention paid to this, as to every other department, by the Directors of the **ÆTNA LIFE INSURANCE COMPANY,** will be more apparent when viewed in the light of the following figures, found in the latest published reports of 3 American, 3 British, and 3 Canadian Life Insurance Companies:—

NAME.	ASSETS.	INTEREST.	RATE.
Equitable, New York	$34,195,368	$1,950,680	5.70
Union Mutual	6,874,249	344,591	5.01
New York Life	35,630,557	2 021,887	5.67
London and Lancashire	851,720	37,325	4.38
Reliance, of London	2,379 410	109,720	4 61
Standard, of Edinburgh	25,939,635	1,120,255	4.31
Canada Life	3,070,988	199,504	6.49
Sun Mutual, Montreal	319,178	21,774	6.82
Mutual, Hamilton	88,068	4,684	5.26
Average	$12,149,797	$644,436	5.35
ÆTNA LIFE,	$23,761,342	$1,856,710	7.81
5 35 per cent. upon $23,761,342 is only		$1,271,131	

Upwards of **$585,000** was therefore realized in 1879 by the ÆTNA'S management from its **$23,761,342** over and above the average of the nine Companies. This is a point of great importance to persons desiring to insure their lives on the "WITH PROFITS" plan. ☞All the profits in the **ÆTNA'S** Mutual Department belong to the Policyholders.

Receiving, as above shewn, a more profitable rate of interest on its funds, and also transacting its large business at a great saving in general expenses, compared with others, this Company is able to offer the public more favorable rates, as may be seen from the following examples. The three endowment columns show the premiums at 40 years of age:

$1000.

NAMES OF COMPANIES.	*Endowments, with Profits, at Death, or the end of* 10 Y'RS.	15 Y'RS.	20 Y'RS.	*Death only, without Profits.* AGE 30.	AGE 40.	AGE 60
Canada Life	$110.40	$68.80	$50.30	$18.20	$25.90	$64.30
Citizens', Montreal	103.70	69.60	53.40	19.20	26.20	63.60
Confederation	104.65	68.70	50.05	19.08	26.04	62.76
Mutual, Hamilton	104.50	68.70	50.00	.....	.....	.....
Sun, of Montreal	106.90	69 40	51.70	16.90	24.60	63.90
Equitable of New York	106.90	69.49	51.78	.....	.....	.....
Union Mutual	106.90	69.49	51.78	.....	.....	.....
London & Lancashire	106.85	69.92	51.56	18.39	25.65	66.58
Star	.....	70.64	52.60	22.92	30.49	67.91
Standard	.....	.....	51.97	20.87	28.15	65.96
Average Premium	106.35	69.41	51.50	19.51	26.63	64.58
ÆTNA LIFE	97.43	64.46	48.77	17.20	24.37	61.98
ANNUAL DIFFERENCE	8.92	4.95	2.73	2.31	2.26	2.60

Besides this important difference in the rates (which is of itself a large dividend—"a bird in the hand") the **ÆTNA** makes a liberal cash dividend every year in reduction of the above profit rates, making in most cases a very much larger difference than here shewn.

THE ECONOMIST

Financial, Railway and Mining Journal.

BOSTON. PUBLISHED WEEKLY. NEW YORK.

$3.00 a Year. 10 Cents a Copy.

THE ECONOMIST IS DEVOTED exclusively to the Financial, Railway, and Mining Interests of the United States. It is the representative journal of its class in New England, and has, by its conservative and independent policy, established a reputation and circulation which give it a commanding influence in its section. It aims to advance and protect the legitimate mining industry, and to guard investors from imposition and consequent losses.

THE ECONOMIST presents special inducements to advertisers through which to reach the wealthy classes of New England. Its circulation among the Mining States and Territories is large and rapidly increasing.

Specimen copies free.

BRANCH SHOP—
Cor. Glengarry Ave. & Stuart st.,
WINDSOR, ONTARIO

FOR SALE, AT A GREAT BARgain, 320 acres of excellent farming land, heavily timbered, and well watered by a branch of the Pigeon River, in Cheboygan Co. Michigan. Apply to th Editor of the CANADA LUMBERMAN. 1-tf.

MACHINERY OILS!

To Dealers and Consumers.

STOCK OLEVINE, Equals Castor Oil, and Warranted not to Gum.

STOCK OLEVINE Equals Castor Oil, and Warranted not to Gum.

It will give the subscriber much pleasure to forward, post free, to any address, on application, a pamphlet, containing instructions and information that have been found of the greatest practical use to dealers and consumers of machinery oil in Canada. It contains the fullest information as to the different kinds of oils, their qualities and uses, thus enabling the consumer to make choice of the very oil best adapted to his wants, and also enables the merchant to select the kinds most likely to be in demand in his neighborhood. This pamphlet shows conclusively that oils properly manufactured from petroleum, are vastly superior to any *animal* or *vegetable* oil. I am now making the same qualities of "Extra" and "XX" oils I manufactured from 1870 to 1873. They are *guaranteed not to thicken with extreme cold*, and warranted to give satisfaction in every particular. Beware of Agents soliciting your orders without my trade-marked order-book. Address

VOL. I.—NO. 2. TORONTO, ONT., OCTOBER 30, 1880. PRICE FIVE CENTS.

PROSPECTUS.

The CANADA LUMBERMAN is now introduced to its patrons, and so far has met with a favourable reception.

Before its publication a large number of lumber and timber merchants and mill owners in the Provinces of Ontario, Quebec, New Brunswick, and Nova Scotia, and manufacturers whose line is to supply machinery for mills, saws, axes. files, oil, belting, sleighs, &c., were consulted in reference to the advisability of publishing such a journal.

Their opinion was that such a publication could be made highly useful to parties engaged in the various branches of trade above alluded to, as well as to those more directly interested in the mines and minerals of Canada.

Acting on their suggestions, THE CANADA LUMBERMAN has entered on this extensive and important field, with an adequate sense of the responsibility of the undertaking; and whilst craving leniency until fairly under way, we may repeat a portion of our introductory, viz: nothing shall be wanting on our part to make this journal a full and complete record of the lumber business, and all that relates to the trade in Canada. To this end the latest market reports, the contributions of trustworthy correspondents, trade circulars, etc., will be freely used, to give our readers the best, the earliest, and most reliable information that can be ascertained, concerning the important branch of business to which the journal will be especially devoted; while the mining, the milling, and the manufacturing interests will receive attention proportionate to their great claims on the public.

In short, it will be our endeavor to make THE LUMBERMAN worthy of its title in every respect; and, while giving special attention to the great staple industry to which it is devoted, it will also furnish a carefully selected amount of general reading that will make it a welcome visitor in every family.

Advertisers, especially those dealing in mill, mining, and lumbering supplies and machinery, will find THE LUMBERMAN a very favourable medium of reaching their customers, as it will circulate among these classes, and receive more attention from them than they have the time or inclination to bestow on a general newspaper.

The success of the LUMBERMAN must depend on the support it will receive from the classes above referred to; we trust, therefore, that they will overlook shortcomings at the commencement, and accord to the enterprise their generous and hearty support.

PRESERVE THE FORESTS.

The following is so applicable to the wooded portions of Canada that we consider it worthy of reproduction :—

"A great deal of interest is being manifested now-a-days in the preservation of the great forests of timber with which this country is overrun. The over-production of lumber each year is immense, and, if continued, will surely end in the disappearance entire of our forests. The question of how to prevent this misuse? is an important one and is worthy of much consideration. We certainly do not envy the position of the English people, as regards lumber, and before mill men and forest land owners leap they should think. We should have some proper safeguards for the preservation of timber and the question should always be considered, "How much lumber will be needed to supply the market this year?"

In some parts of the east there is no overproduction, and oftentimes the supply of lumber is not large enough to meet the demand. At such times lumber dealers order many thousands of feet from the west, for they are aware of the fact that western mill-men do over-produce and are not so chary with their timber lands as they ought to be. There is one very good reason for this economy on the one side and wastefulness on the other. In the east the lumbermen have seen the forests of magnificent trees disappear; they have seen the mills shut down; they have seen the workmen leave for western parts. Hence it is that the second growth is being cut very sparingly, and what more is needed each year is sent from the western part of the country.

You all know what stringent laws are enforced in England and other European countries, relative to the consumption of timber lands and the felling of trees. And in the oriental countries many portions have become uninhabitable because of the disappearance of the forests, and are now given up to ruin and desolation. The great bulk of lumber, which goes into Europe, proceeds from North America. Canada furnishes large quantities to England and the English people much prefer to buy their timber from abroad than cut down the few remaining forest trees. On ships, which carry large loads of deals from this country to Liverpool, are all sorts of pieces many of which would seem utterly useless to the average Michigan mill owner, but uses enough are found for them in a country which can boast of no timber production, and happy they are to get them.

At the twenty-ninth annual meeting of the "American Association for the Advancement of Science," which was held in Boston, several days, beginning Aug. 25th, there was a striking and most excellent paper read on the importance of taking requisite steps to preserve and cultivate the woodlands of the country. The paper, or report, was accompanied by a draft of a memorial which invites the attention of state legislature to the "great and increasing importance of providing, by adequate legislation, for the protection of the existing woodlands of the country" against "needless waste" and for the "encouragement of measures tending to a more economical use and proper maintenance of our timber supply." The report was to the effect that the forests of our country are being used and wasted to a much greater degree than their restoration by natural growth.

The committee recommended a law to protect trees planted along the highways, and to encourage such plantings by deductions from highway taxes; also the passage of a law which shall exempt from taxation the increased value of land arising from the planting of their trees where none were previously growing, for such a period as may seem proper, or until something shall have been realized from the plantation. This law may be enforced they think, by "appropriations of money to agricultural and horticultural societies, to be applied as premiums for their planting and for prizes for the best essays and reports upon subjects of practical forest culture; by encouraging educational institutions to introduce courses of instruction having reference to practical sylviculture; by laws tending to prevent forest fires; by imposing penalties against wilful or careless lighting of such fires, and enlarging and defining the powers of local officers in calling for assistance and in adopting measures for suppressing them; by establishing under favourable circumstances model plantations; and by the appointment of a commission of forestry under state authority analogous to the commission of fisheries."

The action of the association on this subject is timely and sensible and it is to be hoped that the appeal will reach the eyes and ears of the legislators in this country. If there was a limit to the number of trees felled each year, there would be no over production. As it is, a flooded market weakens prices and a light market strengthens them. Look at the subject from every point of view; if this waste goes on the extinction of timber will not only be the outcome, but it may work the ruination of the town or city in which you live. We hardly think that this extinction will come so soon as anticipated by many, but, at the same time, we feel it to be the duty of every man, to do whatever is in his power for the good of this country. Let your aim be to produce just as much as can be disposed of at a fair price and there can then be no such thing as fluctuation, and the end of the production will be postponed indefinitely.

It is quite safe to predict that many years will not elapse before the legislatures of the several states will pass laws limiting the timber cut to a certain number of thousand feet, by each mill, per year. It cannot be otherwise. The newspapers are beginning to look into the matter, the wisest men of the country are beginning to investigate the subject and soon the mill men will see the folly of their ways. This is an age of progression.

SHADE TREES.

Our farmers make a great mistake when they neglect to plant young trees along the roads and their fences; and when they indisciminately and ruthlessly cut down all the trees on the homestead. It is true that in clearing land, it is sometimes difficult to save any portion from the fire; yet groves should be planted in corners of fields, and fences, and roadsides should not be neglected. The Association of Agriculture and Arts granted a gold medal, this year for the best kept farm, to J. P. Carpenter of Townsend, in the County of Norfolk. The judges were so much pleased with the wooded portion of the farm which had been preserved, that they noticed it specially in their report as follows :

"Towards the back part it becomes undulating and gradually rising, finishes up with a magnificent piece of woods at the farm. This wood of twenty acres is beautifully kept and park-like, and forms a very attractive feature, running along a good part of the back of the farm, where the land rises to the highest point. It forms a background and a finish to what no doubt is one of the finest farms in Ontario. And fortunate it is that this property did not fall into the hands of some Vandal, who, by this time, might have had this, as well as the other two pieces of wood, which are equally beautiful, converted into so many barrels of potash, and thereby have destroyed what would require the t of two or three generations to replace. ime

WHITBY.

Last Wednesday the schooners Bentley with 500,000 feet, Adriadna with 150,000 feet, and Blakely, with 140,000 feet of lumber on board, sailed from Whitby harbour, for Oswego, making the largest shipment of deals from that point, on any given day, within the recollection of the oldest inhabitant. The lumber belonged to Messrs. Bigelow & Trounce, Port Perry.

A lumber firm of Carleton Place is said to have paid $14,000 to the Canada Central railway for freight on lumber during the past four months.

Shipping at Montreal is going on with all possible speed. Piles of lumber are rapidly diminishing. It is expected that the present stock of lumber will be all cleaned out within the next two weeks.

A REALLY GOOD CASE.

A LEGEND OF ST. MICHAEL'S HOSPITAL.

Every one knows that St. Michael's, as we shall take the liberty of calling it, is the largest and most celebrated of tht London hospitals. It is situated quite in the heart of the city; and is about equidistant from London Bridge, Westminister, Gower Street, Smithfield, and Whitechapel. I was student there, and there the happiest days of my life were passed. And now to my story.

A large number of the students had gone down for the short Christmas vacation, and I should have gone also, but was just then "dresser" to Carver Smith, and could not leave town; moreover, it was my week of residence. I must beg you to remember, what is perhaps but little understood by the general public, that a large part of the watching and care, and a certain proportion also of the treatment of hospital patients, devolve upon assistants selected from the senior students. Some of the less important appointments, such as the "dresserships," are held by every student in turn; but the more responsible offices, some of which require twelve months' residence in the hospital, can only be gained by a few men each year; and for these appointments, which are esteemed positions of great trust and honour, and which are exceedingly valuable as stepping-stones to professional success, there is very keen competition. On the surgical side of the hospital, each of the four visiting surgeons had a resident house-surgeon; and to be Sir Carver Smith's "H.S." was one of the highest ambitions of a "St. Mike," for Sir Carver was at that time one of the leading English surgeons.

A man named George Adams held the post at this time; and as he is the hero of my story, so far as I have a hero, I will just say a word about him. He was one of these men that we occasionally meet with, who seem to stand head and shoulders above their fellows—very quiet and reserved, and when he chose, quite inscrutable. No one knew where he came from. But his very great ability, his calmness in all emergencies—I never saw him discomposed except once—his mature judgment, and his great kindness, won him the respect alike of the students, the nursing staff, and the surgeons. Under him were four dressers, junior men, who assisted in the hospital under his direction. I was one of them. Each week, one of us in turn resided in the hospital; and as I said, Christmas week fell to my turn, and that is how I came to spend Christmas in St. Michael's. I ought to add that there were four assistant-surgeons to the hospital; but their care was over the out-patient department, and it was only in the absence of the visiting surgeons that they had any duty in the wards.

Well, it was Christmas night, and our work for the day was done, except, some late visits to the wards by-and-by; and of course any casualities that might turn up. But Christmas day is usually slack in that respect. It is medical rather than surgical casualities that Christmas day produces. We had got up in honour of the day a little entertainment in an empty ward, for any of the hospital inmates who cared to attend and were able to do so.

We had a famous little programme. One or two of our residents could play and sing well; another had a curious facility in whistling to the piano; another was an amateur ventriloquist and prestidigitateur; and I fancy there were also some recitations and tableaux to come off. Also, there was one of the patients, an old sailor, who could sing in a grand rich stentorian baritone and bring down the house. Our chairman—Adams, of course—had just begun, and was delivering himself in a semi-serious way of some very eloquent remarks, amidst great applause—for nothing pleases the lower classes better than a few oratorical flourishes—when "tinkle, tinkle, tinkle, tinkle" went a small high-pitched imperious bell. It was the accident-bell!

Oh, ye lay mortals, ye little know how the social and domestic joys of a medical man are at the mercy of a bell! We invite our friends to tea, we welcome them, and anticipate a pleasant evening, and—there goes the bell! We come home tired and wet, change boots for slippers, and get comfortable by the fireside, and—there goes the bell! We turn into bed on a cold night, and just get warm and snug when—there goes the bell! My bell-experience began that night at St. Michael's, and I shall not soon forget it.

It was Sir Carver's "taking in week;" and his assistants had to attend to the accidents. Adams nodded to me; and off I went to investigate, knowing it might be anything from a cut finger to a railway smash. I found a scene of considerable excitement in the accident-room. Two policemen, aided by a crossing-sweeper and a cabman, had just brought in a patient, and some other spectators had pushed their way in out of curiosity.

"Just happened outside, sir; knocked down by a runaway cab, sir."

"Lost a lot of blood; 'fraid it's a bad case, sir." Thus the policemen.

"Ask Mr. Adams to come down at once; clear the room," I said.

It was a young fair-haired girl of eighteen or nineteen, perfectly pale, unconscious, and almost pulseless. A strange contrast to her rough, swarthy, weather-beaten bearers. A deep wound in the neck was bleeding profusely; but on tearing open the dress, I found I could stop the hemorrhage almost entirely with my finger.

Adams was there immediately; in a minute he knew all about it, and had settled his course of action. Quietly he said: "Send for Sir Carver. Take her to the operating-room at once. Ask the other men to come." And then to me: "Keep up steady pressure, and don't take your finger away for an instant."

Nothing could be found out concerning her. No one was with her when she was struck down. She was very tastefully, though not expensively dressed. Her features were exceedingly regular and pretty, and when the colour was in her face she must have possessed a very considerable share of good looks. Nothing but a purse and a handkerchief were found in her pocket. The former was well filled, and the latter was marked "E. Stead." Adams said at once that she was a lady.

I do not know whether it ever happened before at St. Michael's that on the occurrence of a sudden emergency, no one of the surgical staff was at hand. Strange to say, it happened so to-night. Sir Carver Smith and three of the asssistant-surgeons lived close to the hospital; but in five minutes the messenger returned with the news that Sir Carver had been called to some aristocratic celebrity at the West End, who had met with an accident, and had taken one of the assistant-surgeons with him. The second was out of town; and the third, who had been left to act in emergencies, had been taken suddenly ill.

We had been discussing the case, and offering advice upon it with all that calm assurance which characterizes embryo surgeons. But matters now became serious. Half an hour would suffice to summon one of the other surgeons; but it was plain that something must be done at once. We all looked at Adams, who had said very little hitherto, but had gone on making everything ready. He simply said: "Begin to give chloroform; I am going to operate."

"What are you going to do?" we asked.

He told us; but I will not inflict any details upon my readers, but will simply say that the sharp end of a broken shaft had made a narrow deep gash in the root of the neck, and had wounded a large artery. The operation contemplated, afforded almost the only chance of life; and to delay it any longer would, Adams said, be throwing that chance away. It was an operation of the highest difficulty and danger under the present condition of the parts; and could its performance have been anticipated, the theatre would have been crowded with spectators from all the hospitals in London. And here was a young surgeon of twenty-five, called on at a few minutes' notice, to undertake what many a long experienced surgeon might hesitate to attempt; for it was impossible to perform it without much additional loss of blood; and it was not at all improbable that the patient might not survive the operation, to say nothing of after-dangers.

Adams carefully explained to the other house-surgeons what assistance they would have to give him; and when the patient was ready, commenced at once. Perfect silence reigned, broken only at intervals by a word from the operator; but indeed he had little need to speak, for we were well drilled at St. Michael's, and everything he needed was put into his hand almost before he asked for it. I think I can still see that quiet eager group of young men under the brilliant gaslight, standing around the pallid, slumbering, unconscious girl; and in the centre the young surgeon, cool, collected, with steady hand, without hurry, without hesitation, doing his work. I have witnessed many of the most brilliant operators in England, and of course have seen Adams himself many times in that operating-room in later years; but I think I never saw that night's operation surpassed either by himself or by any one else. A special demand sometimes calls forth special powers, and acts almost like an inspiration; and so it seemed now.

In a short time it was done, and successfully done; and the patient was carried away to a quiet ward, where she was duly cared for by the nurse in charge, Adams, and Sir Carver Smith, who came later on. I think Adams stayed up all night.

Our miscellaneous entertainment did not come off; but we scarcely regretted the change of programme. In a place where accidents are hourly, and operations daily occurrences, one more or less seldom creates much excitement; and when I go on to say that this case excited more interest among residents and non-residents than almost any other case I ever saw in the hospital, I wish you clearly to understand that this fact was due entirely to the extreme professional interest of the case, and the great enthusiasm of St. Michael's men for the study of surgery. At the same time I may state, although not particularly bearing on the question, that the patient was an uncommonly pretty girl; and day after day passed by without any light being shed on the question as to who she was and whence she came—circumstances quite sufficient to excite in a mind not preoccupied with such matters as burden the intellect of the average medical student, the liveliest interest and curiosity.

After the operation, she was at first too ill to be interrogated; and when she got a little better, she declined to give any information; at any rate none could be obtained from her. Perhaps she was a little "queer" with feverish or hysterical excitement,

At the expiry of two days I went in to help with the dressing. She was very grateful for everything done for her, and bore her pain very well. For a long time she was in a very critical state. As the cuphonious phrase of the young profession went, "She had a very close shave for it." At the end of three weeks however, she was in fairly smooth-water; and for the first time some of the clinical class went in with Sir Carver to see the case. He had hitherto said nothing on the subject of the operation. He was a man of few words; but one word of praise or blame from him was never forgotten by any of us. Turning to us from the patient, he said: "This, gentlemen, is a case of so-and-so;" and he briefly explained it. Then he added: "Nothing but the most exceptional circumstances could justify a house-surgeon in this hospital in undertaking an operation of such importance. In this case, those exceptional circumstances existed. The operation is one of great difficulty and rarity. I have once, many years ago, performed it myself, and the patient died. Had my patient recovered, such a recovery would *then*, I believe, have been without precedent. But the gratification to myself of having performed the first successful operation, would not have been greater than is my gratification now at having under my care a case which will, I believe, recover, and whose recovery will be due without doubt to the prompt and skilful action of a St. Michael's student, my own house-surgeon, Mr. Adams."

"Strong for Carvy, and good for Adams," was the general comment. Adams pretended to be writing notes; but there was not one of us who would not readily have suffered "ploughing" in our "final college" to gain such a word from Carver Smith.

Yes; she recovered rapidly; and prettier and prettier she grew as she got better. She talked very little, and said nothing at all to help her identification. Inquiry was fruitless, even though the case got into the newspapers. The interest among the students increased daily. It was reported that she was an heiress who had quarrelled with her guardian; that Adams was madly in love with her; that she was waiting for him to propose, and then would marry off-hand; that Adams knew all about her, but kept it snug. And the men got to chaffing him in a mild sort of way, wanting to know the "state of the heart" and the chances of "union by first intention." But Adams was impenetrable. Personally, I am inclined to think that whatever the condition of his patient's heart might be, *he* was a little affected in that region She was evidently very fond of him, and liked no one but him to dress the wound. Still the mystery increased.

At last one afternoon I was sitting in Adam's room in a leisure interval, when a lady's card was brought in. It had a deep black border, and bore the inscription: MRS. STEAD, The Cedars. She wished to see Mr. Adams. Immediately afterwards, the lady was shewn in. Adams motioned me to stay. She was a fine, tall woman of fifty, dressed in deep mourning, with hair just turning gray. a firm mouth, soft keen gray eyes, and a face combining intellect and kindness.

"Have I the pleasure of speaking to Mr. Adams?" she said.

He bowed.

She then produced a paper which gave an account of our famous case and of the part Adams had played in it.

"May I inquire whether this patient is still in the hospital? Can I see her?"

"Yes; certainly. Would the lady be able to identify her? Would it not be better for the patient to see the card first, to avoid sudden excitement; that is, if the lady's visit were likely to cause excitement?"

"Perhaps it would be better to take up the card, and say that Mrs. Stead desired to see her."

Wonderfully calm and self-possessed the lady seemed to us; and yet she could not entirely suppress some signs of emotion or excitement. She said that illness in her family had prevented her from seeing the papers for some time, or she would probably have been here before.

I took the card up and shewed it to the patient. She turned very pale, then buried her face in her pillow and burst into tears.

"Shall the lady come up?" I said.

I thought she sobbed out "Yes."

The visitor came up. Slowly and calmly she walked up the ward. The news had somehow got about, and several of the men found that they had business in that part of the hospital just then. The lady stood by the bed, and said softly:

"Elizabeth?"

The girl looked up, and their eyes met. One glance at the face was enough.

"Yes," said the lady; "I can identify her."

"It is your daughter?" asked Adams.

"It is my cook," said the lady—"Elizabeth Saunders."

I think I said that I only once saw Adams considerably discomposed, and that was on the present occasion,

"I—I—thought her name was Stead," he said, and his eyes rested on a pocket-handkerchief lying on the pillow. The lady's eyes followed his, and a slight smile played on her features.

Yes; it was even so. The acute scientific observer, the far-sighted young surgeon, famed for his diagnostic acumen, had seen through this case, but had not seen through his patient. It turned out that the girl, being remarkably good-looking, and having acquired, from a previous situation in a nobleman's family, a very correct way of speaking and some very ladyish manners, and frequenting places of public amusement, where she usually attracted a good deal of attention. Her mistress having been called away from home to nurse a sick relative, had allowed her servant to go, as she thought, to visit her parents in the country; but the girl, having her wages in her pocket, had preferred to remain with an acquaintance in Londay, where she enjoyed her Christmas holidays very much to her own satisfaction, until her accident put a stop to her manœuvres, or rather changed her field of action. Finding, as she recovered, that she was being addressed as "Miss Stead," and that she was the object of much interest and attention, it seems to me—judging by what experience of human nature on its female side I have since acquired—not very remarkable that she preferred to keep up the delusion; golden silence being her main line of tactics. And, fair readers, do you think it very contrary to your experience of human nature on its male side, that an otherwise exceedingly acute young man should be the subject of a delusion of this particular kind?

The lady spoke very kindly to the girl; and guessing, I fancy, how matters stood, said some very graceful things to Adams. Subsequently, you will perhaps be glad to hear, she proved a very kind friend to him, and her influence was of no small assistance to him in his future professional advancement. She became, in fact, quite a mother to him, though not a mother-in-law.

I really do not know what befel the girl, except that, at her own desire, the lady obtained for her "a situation in the country, out of the way of temptation;" and that she proved to be a faithful servant.

I am sorry to have to state that public interest in this case at St. Michael's somewhat rapidly declined after Mrs. Stead's visit; perhaps because, as the *Lancet* said, the interesting symptoms had all disappeared. But I said then, say now, and always will say, that it was, from all points of view, "A Really Good Case."

WOMAN GOSSIP.

A Bridal Greeting.

On thy bridal morning
Skies are blue and bright;
With how sweet an aspect
Day has followed night!
O! thou gentle maiden,
With the amber hair,
Be thy future bright and pleasant
As this morn is fair.

Fashion Notes.

BUTTONS are more wildly extravagant than ever.

BOTH square and round trains are worn in evening toilet.

FANCY feathers show the influence of the craze for plaided effects.

SOME very small bonnets appear among late novelties in millinery.

THE "Abbe" is the new hat worn by ladies returned from abroad.

A TRIMMING much in vogue is black net embroidered with jet beads.

DEEP tucks on dresses are a recent revival of a fashion of ye olden time.

FRENCH modistes add flowers as accessories to all but the simplest dresses.

PLUSH roses form the favourite garnitures of many lovely evening dresses.

IRISH point and church lace form the most fashionable mull neck scarfs.

BLACK dresses still hold their own and are as elegant and fashionable as ever.

AFTER the rage for big bonnets has subsided, the medium sizes will probably be most worn.

BONNETS, muffs and costumes match when worn by the most fastidiously fashionable women.

JET or coloured crystal beads enrich all the richest trimmings and embroideries on dressy costumes.

Waifs.

A GOOD soldier is an easy catch. He is always ready for an engagement.

THE spots on the sun do not begin to create the disturbance produced by the freckles on the daughter.

WHEN a man and a woman are made one, the question "Which one?" is a bothersome one until it is settled, as it soon is.

A LADY assistant in a glove shop was almost mad when a fellow asked her if she had any nice dark-coloured kids.

WHEN does a budding young damsel burst into fruit?—When she becomes the apple of somebody's eye.

SOME crusty, rusty, fusty, musty, dusty, gusty curmudgeon of a man gave the following toast at a celebration:—"Our fire-engines—may they be like our old maids ever ready, but never wanted!"

"I CAN'T go to Europe," a lady is reported to have said; "I am reading forty-five continued stories, and my limited means would not let me pay the postage."

WHEN old Mrs. Pinaphor heard that a certain young lady had "gone to Europe to catch a husband," she innocently observed: "Why, is there no one in this country who will have the girl?"

THE faculty of an Ohio female seminary has issued orders that no pupil shall have more than one male visitor per week. The smart girls invite their young men to call on Sunday, so that when their fathers come on Monday the old men find themselves barred out.

A YOUNG man with an umbrella overtook an unprotected lady acquaintance in a rainstorm, and, extending his umbrella over her, requested the pleasure of acting as her rainbow. "Oh!" exclaimed the young lady, taking his arm, "you wish me to be your rain-dear." Two souls with but a single umbrella, two forms that stepped as one.

Poetry of the Table.

More appetizing than all patent tonics is a perfectly arranged table, sparkling with cleanliness. So let us be a little extravagant in our fresh tablecloths, when soap, water, and a little labour are all we have had to pay. And now we must decide, shall we have the best china and do with some stoneware for every day? Or shall we pay ourselves the respect usually reserved for company? Clearly, we are the persons to whom it is of the most importance. Shall we sit down to odd plates and cracked saucers six days, that we may enjoy gilded china on the seventh? By no means. We will have plain white French china, which can always be matched when broken, and we will sit down to it every day. In the same way we will bring out the plated knives and silver forks, and partake of our food with a sense of our own deserts. We shall feel increased respect for ourselves, also, with napkins and butter plates; so those we will have.

A Girl Monk.

Matrena Ivanovna, a Russian peasant girl of two-and-twenty, has recently acquired considerable notoriety in her native land, says *The London Telegraph*, through the fact that, under the monastic designation of "Father Michael," she succeeded in passing several months in the cloister of Staraja Ladoga, without incurring the least suspicion on the part of her fellow-monks that she was other than she seemed to be. Forced by her father to marry a person whom she detested, she disappeared from her home on the day succeeding her wedding, and, upon search being made, her clothes and two long plaits of her "back hair" were found near the Wolchoff river, as well as a letter in her handwriting, stating that, rather than live with her husband, she had resolved to drown herself. Her relatives, believing that she had really committed suicide, forbore any further inquiry, and mourned for her as one dead. She, however, dressed in man's clothing, applied last March for admission to the above-named monastery, and was duly received into the confraternity on probation, taking the minor vows, and officiating as coachman to the prior. There is no knowing to what ecclesiastical dignities she might not in time have risen, had not unkind fortune decreed that a native of her own village should have been sent to Straja Ladoja by his master for correction at the hands of the brethren, his offense being inveterate drunkenness. Promptly recognized and denounced by this indiscreet toper as Matrena Ivanovna, a friend of his youth, "Father Michael" was handed over to the police authorities by the indignant monks, and is now awaiting trial for imposture upon a religious community—a crime likely to be visited with severe punishment in so priest-ridden a country as Russia.

Small Feet.

An American missionary, Miss Norwood, of Swatow, has lately described how the size of the foot is reduced in Chinese women. The binding of the feet is not begun till the child has learned to walk and do various things. The bandages are specially manufactured, and are about two inches wide and two yards long for the first year, and five yards long for subsequent years. The end of the strip is laid on the inside of the foot at the instep, then carried over the toes, under the foot, and round the heel, the toes being thus drawn toward and over the sole, while a bulge is produced on the instep, and a deep indentation in the sole. The indentation, it is considered, should measure about an inch and a half from the part of the foot that rests on the ground up to the instep. Successive layers of bandages are put on till the strip is all used, and the end is then sewn tightly to the ground. Large quantities of powdered alum are used to prevent ulceration, and lessen the offensive odour. After a month the foot is put in hot water to soak some time; then the bandage is carefully unwound, much dead cuticle coming off with it. Ulcers and other sores are often found on the foot. Frequently, too, a large piece of flesh sloughs off the soles, and one or two toes may even drop off, in which case the woman feels afterward repaid by having smaller and more delicate feet. Each time the bandage is taken off the feet are kneaded, to make the joints more flexible, and are then bound up again as quickly as possible with a fresh bandage, which is drawn up more tightly. During the first year the pain is so intense that the victim can do nothing, and for about two years the foot aches continually, and is the seat of a pain which is like the pricking of sharp needles. With continued rigorous binding, the foot in two years becomes dead, and ceases to ache, and the whole leg, from the knee downward, becomes shrunk, so as to be little more than skin and bone. When once formed, the "golden lily," as the Chinese lady calls her delicate little foot, can never recover its original shape.

How a Married Woman Goes to Sleep.

There is an article going the rounds entitled "How Girls Go to Sleep." The manner in which they go to sleep, according to the article, can't hold a candle to the way a married woman goes to sleep. Instead of thinking what she would have attended to before going to bed, she thinks of it afterward. While she is revolving these matters in her mind, and while snugly tucked up in bed, the old man is scratching his legs in front of the fire, and wondering how he will pay the next month's rent. Suddenly she says:

"James, did you lock the door?"

"Which door?" says Jim.

"The cellar door," she says.

"No," says James.

"Well, you had better go down and lock it, for I heard some person in the back-yard last night."

Accordingly Jim paddles down stairs and locks the door. About the time James returns and is going to get into bed, she remarks:

"Did you shut the stair door?"

"No," said James.

"Well, if it isn't shut the cat will get up into the bedroom."

"Let her come up, then," says James, illnaturedly.

"My goodness, no," returned the wife. "She'd suck the baby's breath."

Then James paddles down stairs again, and steps on a tack and closes the stair door, and curses the cat and returns to the bedroom. Just as he begins to climb into his couch his wife observes:

"I forgot to bring up some water. Suppose you bring up some in the big tin."

And so James with amuttered curse goes down into the dark kitchen and falls over a chair, and rakes all the tinware off the wall in search of the "big" tin, and then jerks the stair door open and howls:

"Where the deuce are the matches?"

She gives him minute instructions where to find the matches, and adds that she would rather go and get the water herself than have the neighbourhood raised about it. After which James finds the matches, procures the water, comes up stairs, and prepares himself to retire. Before accomplishing this feat the wife suddenly remembers that she forgot to chain the dog. A trip to the kennel follows, and he once more jumps into bed.

Presently his wife says:

"James, let's have an understanding about money matters. Now next week, I've got to pay—"

"I don't know what you'll have to pay, and I don't care," shouts James, as he lurches around and jams his face against the wall; "all I want now is sleep."

"That's all very well for you," snaps his wife, as she pulls the covers viciously; "you never think of the worry and trouble I have."

A Mixed Telephone.

The telephone, the wonderful offspring of Edison's great mind, is an instrument which is now looked upon as indispensable to the world's good, but it, like a great many other things, will sometimes get out of humor and act in a very crooked manner.

Mr. Charles Augustus Fitzmont is an enterprising but bashful young clerk, whose place of business is on King street, and he is most warmly attached to a fair maiden who lives in an up-town residence with a telephone in it. Oft the telephone has been used as a medium through which he has breathed words of heart-pounding love in the ears of the one he so fondly worshipped, and never did he know it to fail in the performance of its duty until yesterday, when it caused him to moan—yes, to tremble like an aspen leaf, and smite one knee against the other.

At the time mentioned Charles had not seen his affinity for over forty-eight hours, and he determined to inform her of whom he was fondly dreaming that he would be up to the house that night and sit out on the front porch with her and sigh at the moon. Seeking the telephone while no one was in the office, he said:

"Is Miss Minnie at home?"

"Yes."

"Tell her to step to the 'phone, please."

"Is that you, Charlie?" inquired a cooing voice skimming along the wire.

"Yes, dearest, it is your own Charles."

"Oh, Charlie, what made you stay away so long? You must come up to-night because——"

"The baby was born an hour ago."

"Wh-at baby?"

"Your own baby."

"My baby!" shrieked the young woman, "why, I'm—I'm surprised that you—you would say such a thing. I—I didn't expect it——"

"Neither did I; I just heard it a moment ago."

"You don't believe this—this fearful report? Say—say you don't. You know I haven't got a baby I never did have a baby in my life," howled the young woman in a frenzy.

"Ha! ha! old fellow, you feel so proud and happy that you have to indulge in a joke, do you? Allow me to congratulate you. It's a boy, and weighs twelve pounds. Good-bye."

"Miss Bunter—I say, Miss Bunter——"

"Oh, Charlie! what is the matter?"

"Matter enough. I want to know the man's name who told you that scandalous falsehood. I'll have his gore before sunrise. I'll follow him over sixteen different states to kill him. I'll crush him. I'll mutilate him. Tell me, was it that squint-eyed Bangs who brought that horrible lie to your ears?"

"What lie, Charlie? What do you mean?"

"I want to know who told you that—that I had a baby born to me an hour ago that weighed twelve pounds. Who is the villain?"

A piercing shriek was the only reply that came over the wire, and then Charles realized for the first time that there was some dreadful mistake, that the telephone had become mixed, and he fainted.

Trouble Brewing in Norway.

THE KING ACCUSES THE STORTHING OF EXCEEDING ITS CONSTITUTIONAL POWERS.

(From the Paris Francaise.)

Not long ago I wrote to you about the constitutional conflict between the Storthing and the Crown on the subject of the attendance of Ministers at the debates in the National Legislature. This conflict is not the only one. A second has arisen which seems likely to reach irritating proportions. At the close of the recent session, several projects for the reorganization of the army, which had been referred to Military Commission, were still incomplete. At one of its last sittings, that of June 19, the Storthing authorized the Commission to sit after the adjournment, and until the beginning of the next session.

Upon the advice of the Norwegian Ministers, the King refused, on August 18, to sanction this action, declaring that it was impossible for him to acquiesce in the introduction of a practice by virtue of which the Storthing could empower a certain number of its members to sit and deliberate in the intervals of the sessions under the name of a committee. The royal decree sets forth that, "in naming a Parliamentary Commission of this nature, the Storthing committed a trespass upon the domain of the Executive, and usurped administrative functions not belonging to it. Furthermore, in authorizing one of its committees to work outside of the sessions, it exceeded its powers in another way, notably by extending the duration of its sessions beyond the term fixed by the Constitution; that is to say, beyond two months." Moreover, "a commission constituted as this one is [three military men, two of whom are very advanced members of the Opposition] does not offer the necessary guarantee that the projects, several of which have not even been examined by the Government, will be subjected to a sufficiently intelligent and impartial study."

It was this last consideration, evidently, that decided the King, for he immediately proposed a royal commission, to be composed of the three members of the Parliamentary Committee and three new and competent members to be named by the Crown. It is clear that this proposition will have to be ratified by the Storthing, which must decide whether or not to permit its members to sit on this new Commission. At this moment it is announced that the President of the Storthing, who is also the President of the Military Commission, has called a meeting of the latter. Naturally this step is represented by the Ministerial press as a grave insult to the sovereign.

BISHOP ELIGIO COSI, at Chang-Tong, in China, has invented an alphabet of 33 letters, by means of which all the sounds of the Chinese language can, it is said, be represented. The Emperor of Austria has been so well pleased with the invention that he has presented the Bishop with a complete typographical apparatus, so that the new alphabet may be employed in printing. The characters used by the Chinese number 30,000.

QUEBEC.

Since the opening of navigation over eight hundred vessels have entered at the Custom House.

The market continues firm. Last week's transactions were—Liverpool, all timber, 25s. Greenock, timber, 25s. and 26s. Plymouth, timber, 25s. Limerick, timber, 28s.; deals, 70s. London, deals, 65s., nominal.

Steamship freights—Liverpool—a parcel of deals, 60s.

The *Morning Chronicle* reports that in timber, deals and staves, the market continues firm. There have been few transactions during the week. Some small parcels, for immediate shipment, have changed hands. A quantity of elm of 45 feet average, was sold at 28 cents per foot.

Deals—Few sales have taken place during the week, and both pine and spruce are in demand.

Staves—Are scarce. A parcel of pipe was sold at something above £80.

The sale of Crown Land timber limits, which took place on the 15th inst., realized about $280,000. All the lots offered, except, a few in the lower St. Lawrence, were sold at an advance in the upset price. There was brisk competition for the berths on the Upper Ottawa, Block A. The attendance was large.

Among those present were Hon. Senator Skead, Messrs. Jas. G. Ross, (President of the Quebec Bank,) J. Gouin, James McLaren (President of the Ottawa Bank), James Poupore, M. P., Moore, McLaughlin, Thistle, Thomas Smith, W. C. Edwards, David Moore, King, Church, E. Fitch, J. Bowen, W. Brodie, Col. Forsyth, Smith Lynch, Campbell, Edwards, Fitzpatrick, Ward Higginson, Henderson. The Assistant Commissioner, Mr. Tache, announced the particulars and conditions of the sale, when Mr. Lemoine proceeded to sell the different lots by auction. The limits which brought the highest prices are those in the Ottawa District.

In the first range, Upper Ottawa Agency, limit No. 4, 39 miles, was sold to E. Fitch for $260, the upset price $75; No. 5, 61½ miles, was sold to James Connolly for $240, upset price $100; No. 6, 38¾ miles, was sold to W. C. Edwards for $220, upset price 100; No. 7, 16¾ miles, was sold to Mr. Lynch for $230, upset price 100; No. 8, 14 miles, was sold to Mr. Lynch for $190, upset price $100; No. 9, 29½ miles, was sold to Mr. Lynch for $165, upset price $75; No. 10, 42½ miles, was sold to Mr. Fitzpatrick for $85, upset price $75; No. 11, 42 miles, sold to Mr. Fitzpatrick for $92, upset price $50; No. 12 37¾ miles, sold to Mr. Lynch for $70, upset price $50. In the second range Mr. Fitzpatrick purchased limit No. 4, 40 square miles, for $80, upset price $75; No. 2, to Mr. Ward, at $325, upset price 75; No. 3, to Mr. Ward at $345, upset price $60; No. 4, to Mr. Moore, for $310, upset price $100; No. 5, to Mr. Edwards, for $300, upset price $100; No. 6, limit was bought by Mr. Fitzpatrick for $290, upset price $100; No. 7, limit by Mr. Jas. Connolly for $190, upset price $100; No. 8, by Mr. Thistle, for $86, upset price $75; No. 9, by Mr. Moore, for $80, upset price $75; No. 10, 11, and 12 limits were sold to Mr. Campbell, for the up set price of $60, $60, and $50. The whole of the limits in the third range, Block A, were sold as follows:—No. 1, to Mr. Thistle for 100, being the upset price; No. 2, to Mr Campbell for $80, upset price $75; No. 3, to Mr. James Connolly for $100, upset price price $60; No. 4, to the same, for $105, upset price $75. The other numbers—5, 6, 7, 8, 9, 10, 11, and 12 were sold to Mr. Campbell at prices which were fully 20 per cent. in advance of the upset price. The limit in Lichfield of six miles was sold to Mr. W. C. Edwards for $115, upset price $100. In the Lower Ottawa agency Letter A was sold to Mr. Henderson for $105, upset price $30; Letter B to Mr. Higginson for $55, upset price $50. The other lots were principally in the Montmagny, Rimouski, Granville, and Saguenay agencies, and brought somewhat lower prices.

SUPERVISOR OF CULLER'S OFFICE.

Comparative statement of Timber, Masts, Bowsprits, Spars, Staves, &c., measured and culled to date:—

WM. QUINN,
Supervisor.

Quebec, 22nd Oct., 1880.

NEW BRUNSWICK ITEMS.

Our St. John's correspondent supplies the following statement of operations on the St. John River and tributaries:

Mr. A. F. Randolph is estimated to take out this winter about 20 million. The principal operators for him are, W. F. Fowler, 5 million; Coulter & Hagerman, 2; G. J. Baird, 4; Beringe Bros., 2; E. Brooks, 1; C. Clayton, 1; Grantham Hopkins, 1; Harrey Lawrence, ½ million. The balance will be obtained in smaller lots.

Mr. W. H. Murray, 27 millions. Mr. Robt. Connors will take out for him 13 million; F. Moore, 8; J. McKeen, 2; W. H. Cunliffe, 4.

Messrs. Miller & Woodman, 17 million. The principal operators for this firm are, James Hays, 8 million; Hammond & Watson, 1; and J. Yerxa, 2 million.

Mr. Alex. Barnhill, 3 million, by Mr. West.

Messrs. Hayford & Stetson, 2 million cedar for shingles, and 6 million spruce logs.

G. B. Dunn, & Son, 10 million.

Mr. Jewett will take out by Jarvis Hayward, 6 million, aud by W. S. Stephens, 3 million.

Mr. Robert Aiken will cut 2 million for Mr. Cushing.

Mr. Hale's cut is estimated at 4 million.

Mr. Layton also 4 million.

Mr. A. Gibson will take out 40 million, all by contract.

Messrs. R. & H. Stewart, *per* Mr. Richards, 20 million.

MANITOULIN ISLAND.

The latest news from this island is, that lumbering goes on actively, the following parties being at work in the woods taking out logs:

Robert and J. Henry are hard at work at Mudge Bay. They have two camps started, and will take out about one million and a half.

The Providence Bay Co. are operating on the south side of the island. They will also take out about one million and a half feet.

Mr. Howard, of Mindemoya Lake (steam mill) is taking out a small quantity for local purposes.

Sandford Mills, on Lake Manitou, are also taking out a supply for local use.

The mill at Gore Bay will get out enough for local supply.

The Toronto Lumber Co., Michael's Bay, (R. A. Lyon, manager), are the heaviest operators. They will take out about five million feet this winter. They have three camps under way at present. The location of those mills is central and convenient for shipping to any point, either south or west. Their business last season is said to have amounted to over $70,000, The lumbering business has tended largely to settle up the island, which has increased in population 15,000 during the past eight years.

A large business is done from the island in cedar ties, for the Chicago market—200,000 will be taken out this winter at the south side of the island, and a large quantity of cedar paving timber, being pieces eight long and not less than five inches at the top.

THE UPPER ST. JOHN.

From Aroostook, on the upper waters of the St. John river, we learn that operations in getting out logs will be largely increased this winter. An exchange says,—The demand for lumber in the United States and other markets, is much improved, and operators feel encouraged to proceed. Where last year one individual cut 2,000,000 ft. of logs, this year five or six operators will cut from 5,000,000 to 10,000,000 ft. This increases the demand for labour and causes a rise in price; it will result in enlarged prices for hay, oats and etc., in Aroostook. Those persons that are hiring men here now pay $5 more per month for labour than they did last year. Pork is an article largely consumed in the woods. Operators are buying pork now at the present high prices, which have been put on the article by the recent "corner" brought about by speculators. The fact will of course increase the cost of getting out the lumber above that of last season. Spruce deals are now selling in St. John for $12, and an extra quality brings $12.25, where last year the prices were $7 to $8 and even lower. The present high rating of deals is owing to the fact of large numbers of vessels being at St. John wanting freights. There are now no logs for sale, as the surplus logs are in first hands.

NIPISSING DISTRICT.

Lumbering operations are going on briskly both on the north and south shores of Lake Nipissing, and preparations are being made by A. P. Cockburn, Esq., to build a steamer for the purpose of towing, as well as for passenger traffic. The new steamer, to be named the *Interocean* is designed by Mr. Chaffey, of Toronto. She will be provided with double engines and a twin screw, and will be of about 150 horse power. The equipments will all be first class, as Mr. Cockburn has had experience in building several steamers. Some of the fittings have already been sent out. The heavier portions of the machinery will arrive by the first through train of the Canada Central Railway, which is expected to reach the east end of Lake Nipissing by July next, by which time the hull of the new steamer is also expected to be ready. Mr. Cockburn was out at Lake Nipissing lately, and has chosen where the steamboat landing wharf will be. The *Interocean* will run up Sturgeon River as far as the first falls, and French River to Chaudiere. Mr. Cockburn deserves great credit forhis pioneer enterprise. The engines and machinery will likely be furnished by Mr. Doty, of Toronto, as the improved engine he put in last season in the steamer *Rosseau* has given good satisfaction.

Tree Planting and Raising.

Those who are interested in forestry will be glad to know that many of the seeds of valuable timber and ornamental trees ripen during the months of September and October, amongst these may be mentioned the horse chestnut, the birch, the ash, the oak, the butternut, the black walnut and the sweet chestnut. It will be well, therefore, for those contemplating the rearing of a large quantity of these from seed to be on the look out during the present month for suitable trees to gather seeds from. The seed should be planted so soon as obtained, and for that purpose ground ought to be at once prepared to receive the nuts and seeds. The planting should be made in rows of a sufficient distance apart to admit of the hoe being used between them, and the soil should be made rich and light by being well and deeply worked. A generous treatment of the soil for the seed-bed cannot be too strongly insisted upon.

Trees of medium age should be selected to gather seeds from as those taken from trees which are too young often prove barren, whilst those from trees of a mature age frequently furnish plants of weakly growth. Nuts and seeds such as ash often refuse to germinate until the second year, so that all hope should not be lost if the first season's crop should not prove a success. So soon as the leaves have fallen and the wood is well ripened, cuttings may be made of the various kinds of willows and poplars, these should be made about eighteen inches long of the present year's shoots, and inserted one foot in the ground. The great success in growing all cuttings is to have the earth firmly deposited at the base of them, and for this purpose the trench in which they are set should be only partially filled and the soil pressed down with a suitable instrument, and then filled up tightly, a piece of slat or board six or eight inches wide and two inches thick, sawn squarely across one end and tapered to a handle at the other makes a handy implement for setting all kinds of cuttings. The cuttings should be planted from six inches to a foot apart, in rows, so as to allow the hoe or cultivator to pass freely between them from two to three feet between the rows would be found a suitable distance both for cuttings and seeds. It would be well if more attention were given to nut bearing trees, amongst which are some of the best for timber, and the handsomest for shade and ornamental purposes, and the fact of their bearing nuts should be no detriment to their being cultivated. Who cannot recall the days of his youth when he sat over the winter evening fire cracking his nuts and chaffing his girl? But the nut bearing trees are getting scarcer as the evenings grow longer, and now there are fewer nuts to crack than formerly; but there is no reason why the rising generation should not have quite as much innocent amusement as their fathers had before them, if only a little judicious forethought was exercised. Most of the nut bearing trees grow rapidly. The writer has seen a growth of six feet made by a black walnut since last spring, and a growth of this length is no unusual sight on young butternut trees. The writer has some young plants of this variety, the nuts of which he planted seven years ago. The trees had catkins on them this spring but did not bear. He has no doubt they will be productive next year. These trees have been twice and three times transplanted, and for the last few years have been growing in a heavy lawn sod, so that although the soil was good the experiment was not on the whole favourable to the rapid growth of the young trees. The wild sweet chestnut, whose fruit though small is of excellent quality, is a very rapid grower where soil and climate are congenial, and will stand the winters very well along the St. Lawrence river front as far east as Cornwall, and is very suitable for planting all over the western peninsula as far north as Owen Sound. The timber of this tree cannot be excelled for furniture, and is chiefly used as bed-room sets. It has a fresh light and neat appearance when oiled and varnished, which brings out its large open grain, and its peculiar rich yellow hue gives it a cheerful appearance. A firm in Detroit manufactures from this wood very largely.

We would recommend the raising of all nut bearing trees from the seed, and transplanting them to their permanent position when from four to six feet high, as these trees are not considered as a rule so easily removed as the seed bearing varieties. Although we know of some set out at 10 to 12 feet high with very great success, but they had been root pruned and re-set before. We believe any one wishing to obtain nuts of the black walnut, or young trees, may get an almost unlimited quantity at a trifling cost from Chief Johnson of the Six Nation Indian reserve at Brantford. This is now the right time in the year to secure nuts, which should be planted as soon as obtained It would be well for our experimental farm to produce a couple of bushels for planting, in order to shew the general public how readily they can be grown, and with what rapidity the denudation of our forests can be restored. The variety, date of planting, etc., should be kept on a stake at the end of the row so that visitors could see at a glance the progress made from time to time.—*National.*

Horse-Meat as Food.

From the Parisian.

Some very interesting statistics have been published by the society for promoting the use of horse-flesh and the flesh of asses and mules as food, showing how steadily the consumption of these articles of diet has been increasing in Paris and the Provinces since the foundation of the society in 1866. The weight has increased from 171,300 pounds in 1866. to 1,982,620 pounds in 1879. In the principal cities of the Provinces the consumption of horse-flesh may be considered to have fairly taken root. At Marseilles, in 1870 there were 599 horses eaten; 1,031 in 1875 and 1,233 in 1878. At Nancy, 165 in 1873, over 350 in 1876, and 705 in 1878; at Rheims 591 in 1874, 423 in 1876, and 834 in 1878; at Lyons 1,839 in 1873, and 1.313 in 1875. In both the latter cases some difficulties had been thrown in the way by the town authorities, as was the case recently at Chalons-sur-Marne, where the Mayor fixed the price of horse-flesh at a higher rate than that of beef. The average price of horse meat is from 25 to 30 cents per pound. Each horse furnishes about 200 kilogrammes (400 weight) of meat, which is capable of being prepared in many by no means unappetizing ways. Such as *pot-au-feu* boiled, roast, hashed, haricot, jugged, filet &c.

A Successful Case of Transfusion of Blood.

The following case, which exhibits in a marked degree the beneficial effects of transfusion of blood when performed in cases of impending death from excessive hemorrhage, is reported in the New York *Medical Journal*, for August, 1880, by Joseph W. Home, Mr D. :

Mrs. B., aged twenty-two years, was delivered of a three months' fœtus, November, 7, 1879. From that date until November 11 she had repeated and profuse hemorrhages from the uterus. On the 10th the bleeding was continuous. Drs. Reynolds and Comstock, who were first called in, succeeded in controlling the hemorrhage, but not before the patient had reached the stage of collapse. They remained with her all night, endeavoring, with the ordinary means of stimulation, to rouse her, but without avail. She continued to sink in spite of everything.

On the morning of the 11th I was sent for. The patient was then completely pulseless and partially unconscious. The extremities were cold and clammy, and it was evident that unless some fresh blood were introduced death would soon supervene. She was so far gone that I made up my mind not to spend any time in defibrinating the blood. I opened the median basilic vein in the right arm of the patient and introduced the closed cannula of Colin's instrument, and after passing some warm water through the cylinder of the instrument, attached it to the cannula in the patient's arm. The median cephalic vein in the right arm of the donor was then opened, and the blood was allowed to flow directly into the cylinder without defibrination. When a sufficient quantity had been obtained, and while the blood was still flowing, I injected, without any difficulty, between seven and eight ounces. The whole operation did not occupy more than five minutes in its performance.

Within half an hour the pulse returned at the wrist, the voice became clear and distinct, and she asked for something to eat saying that she felt stronger and better in everyway. One of the medical gentlemen who had been with her all night assisting in the attempts at resuscitation, and who left in the morning, believing that there was no hope of her recovery, came in an hour after the operation, and said it was "a perfect transformation scene"—that he had no idea that a few ounces of blood could restore lost vitality so rapidly.

From that time on the patient continued to improve, and when I last heard from her she was in the enjoyment of good health and attending to her household duties without any discomfort whatever.

Hose Pipe Nozzles.

Who is going to invent the nozzle of the future? There is no nozzle that we have ever seen that seems to us to control the stream it delivers as it should do. Instead of projecting a solid stream for a long distance, the water breaks soon after leaving the nozzle, and soon sprays and breaks up altogether. We often hear of steamers throwing 250 and 300 feet, but we recently heard a veteran chief say that he had yet to see the apparatus of any kind that would throw a solid stream 100 feet. The difficulty may be all with the water, which is naturally inclined to separate, but we are of the opinion that part of the trouble lies in the construction of the nozzle. An experimeat made at Boston by putting a core into a play pipe, and thus dividing the stream into four parts. depriving it of its rotatary motion, showed a gain of thirty feet in distance playing. But even this does not seem sufficient. Our steamers give us power enough for throwing, and the hose in use gives every facility for carrying a large volume of water; there should be some means devised for delivering that volume in a solid stream at long distances. Great difficulty has been found in making nozzles operate uniformly at all times. A manufacturer of steamers once found a nozzle that gave him great satisfaction; with it his steamers could throw greater distances than with any he had ever tried before. He ordered half a dozen more just like it. The half a dozen were made precisely like the first, but never equalled it in delivering water. There is much to be learned yet regarding this question of delivering water on fires, and the exact relations existing between pressure, hose, play pipes, nozzles, and the friction of water more clearly understood.—*Fireman's Journal.*

SCIENTIFIC GOSSIP.

THE Hungarian State railways are in all 1,119½ miles in length, and they yield an income of about 1⅛ per cent. per annum on the capital invested in them.

To the alteration and metamorphism of rocks by the infiltration of rain and other meteoric waters, M. de Konick, of the Belgian Academy of Sciences, assigns the cause of many hitherto unexplained phenomena in geology.

FROM the inquiries conducted by Prof. Hermann Cohn, of Breslau, since 1866, it appears that short-sightedness is rarely or never born with those subject to it, and is almost always the result of strains sustained by the eye during study in early youth. Myopia, as it is called, is seldom found among pupils of village schools, and its frequency increases in proportion to the demand made upon the eye in higher schools and in colleges. A better construction of school desks, an improved typography of textbooks, and a sufficient lighting of class rooms, are the remedies proposed to abate this malady.

THE *Electrician* tells this story : A number of gentlemen were the other day about to dine, and one of the covered dishes was especially cared for, containing, as it was seriously averred, a *gymnotus*, fresh from the rivers of South America, which was to form part of the repast. Usually, electricians scrupulously observe decorum, but the Chairman, instead of pronouncing the benediction, turned to the dish containing the eel and solemnly requested grace, when, with a sweet cadence, as if from a mermaid in cavernous regions, was heard all over the place : "Be present at our table, Lord," &c. The cover was then raised and the anticipated electric eel turned out to be a telephone, which had been ingeniously connected to a distant room, and which, being a religiously good telephone, not only produced a pleasing sensation to all present, but afterward returned thanks in a powerful but well-known voice to the admiring listeners.

THERE is no question now among the most conservative of engineers that this time the electric light has come to stay. Perhaps as yet the most extensive use of this light in any one establishment is that in the Royal Albert Dock, London, an extension of the Victoria Docks, which covers 80 acres of water space, and has nearly eight miles of quays. The lamps used are the Siemens pendulum kind, with the body of the lamp above the arc, and the carbons so regulated that the position of the arc is fixed. Each lamp is placed on the top of a pole 80 feet high, and its effective illumination overlaps that of its neighbours. To generate the electricity, the Siemens "D 2" dynamo-machines are employed, one to each lamp. The *Engineering* says that the most interesting feature of the sets of generators is that the whole of the available current generated in each machine is conveyed to its corresponding lamp, none being utilized and absorbed in its passage for exciting the field magnets. In order to do this a separate dynamo-machine, specially constructed, is employed, the current developed by which is transmitted through the magnet coils of all the illuminating machines in series. By this arrangement, the essential principles of which was first conceived and announced by Mr. Henry Wilde, of Manchester, motive power is economized and greater constancy of current is insured. It is reported that the illumination of the dock, with its quays and surroundings, is very perfect, and that the effect is most beautiful. Between the machines and the lamps the distances vary from 120 to 1,100 yards.

How did we come to possess our present form of dress? This is one of the many questions answered by a reviewer in the *Nature*, who had under his notice the catalogue of the Gen. Pitt Rivers anthropological collection lately noticed in this column. Clothing at first was almost entirely ornamental. The exceptions were such articles as belts from which instruments of various kinds could be suspended so as to be ready for use while the hands were left free. A savage does not enjoy the luxury of a pocket. Even at the present day a Japanese has to sling his tobacco pipe and pouch from his belt, and the only pockets he has are in his sleeves. The simple cincture was the germ, so to speak, of the clothing we wear. After some time a bunch of pandanus slips was added in front, and this was gradually extended until it made a complete fringe around the body. When the arts became so far advanced that man could make paper cloth or some woven material these latter were substituted for the primitive fringe, and the kilt was thus developed. Curiously enough, the dress of the Scottish Highlanders embodies these two stages of progress in the kilt and the sporran. As man advanced there were inconveniences attending the use of the kilt, which were abated by fastening that garment at one point between the legs, and the human mind was then fairly set upon the path to arrive at the attainment of a pair of trousers. When the back and shoulders needed protection the savage used the skin of some animal, and it is from this sort of covering for the upper part of the body that we have derived our coats, vests, shirts, &c. But the ancient cloak form is even yet retained, not only by such people as Zulu chiefs, but in all robes of ceremony by dignitaries of court and college of the most highly civilized nations on the face of the earth. The elaborate and varied head coverings of the present day all sprang from a very simple original type.

Scotland's First Printed Books.

(From the Pall Mall Gazette,)

If one or two of the Scots who travelled abroad in search of fame and fortune could have made up their minds to return to their native land, the art of printing might have been introduced into Scotland at a much earlier date than 1507. As it was, it took 30 years for the new practice to travel from Westminster to Edinburgh. The first printing-press in Scotland (as was stated at yesterday's meeting of the Library Association) was established in that year somewhere off Cowgate by a printer called Walter Chapman, who was employed in some capacity about the court, and was presumably permitted to set it up in payment for some services he had rendered to his patron. The first books printed were a volume of "Metrical Ballads" and "The Aberdeen Breviary," in two parts. Of the former work there is but one copy in existence; the latter was printed under the superintendence of a Bishop of Aberdeen, and four copies are still preserved, though only one possesses a titlepage. No other works were printed until 1531, but from that year to the end of the century a vast quantity of printed matter was struck off for the benefit of the nation. Most of these volumns were no sooner in existence than they seemed to have perished. We know from the wills of the printers that in many cases they left behind several hundreds of copies of particular works, although the most learned bibliographer can only now tell the *habitat* of one or two of them. What became of the rest is a question which has puzzled many minds. Possibly they were thumbed by their owners out of their lives.

Dulcigno.

The Paris *Temps* gives the following account of Dulcigno : "The town is composed of two parts, separated from each other by the port—the old town, containing the citadel, and the new town, in which the population is almost entirely concentrated, and which comprises about 400 houses. It is evident that if the squadron had opened fire it would have directed it solely against the citadel, where there are not eighty houses. The inhabitants would not have had to suffer from the bombardment. The certainty of not being in danger, even in case of military action, has, perhaps, had something to do with the obstinate resistance the inhabitants of Dulcigno have made to the cession of their town to the Montenegrins. The chief reason, however, is that they are nearly all Mussulmans; they number from 2,800 to 2,000, and it is said that till 1858 no Christian was allowed to choose his residence at Dulcigno. Lastly, it is said that the Mussulmans are a race of pirates, who have only given up piracy since 1815—that is, since Austria has had possession of Dalmatias and has created a navy.

A LONDON tailor has invented "the united suit," which consists of a man's complete attire in one garment.

THE Russian traveller Remiaowitch-Dantschenko, has discovered on the highland of Daghestan a tribe resembling Cossacks, but following the Mosaic law strictly, and retaining ancient Jewish names—undoubtedly one of the lost tribes.

THE number of yearling thoroughbreds from the great breeding establishments of England sold during the past year aggregated 451, the progeny of 112 sires. They realized 89,996 guineas—a decrease in the amount paid to breeders of 41,773 guineas as compared with 1877, when 486 yearlings brought 131.666 guineas.

A Revengeful Owl.

A remarkable instance of intelligence shown by an owl in conceiving and carrying out a project of vengeance on a farm labourer who had destroyed a whole family of young ones before they had gained the requisite strength to take wing is related by a French provincial journal. An owl had built its nest in an old oak-tree which grew near a farm in the commune of Beauvry. Its mate had laid during the month of July several eggs, which in due time developed into a promising progeny of young birds. A farm labourer, moved by a sentiment of aversion for owls, which is common in country parts, determined a few days ago to cut short the lives of the young ones, and choosing a favourable opportunity, put his project into execution. The infant owls were taken away from the maternal nest and massacred, but by what followed it will be seen the parent birds did not allow their tragical fate to remain unavenged. On several evenings succeeding that during which the nest had been plundered, the villagers returning from the fields remarked the male owl flying in an agitated manner round the farm, but no attention was paid to the circumstance, which was put down to a lingering attachment on the part of the bird to the spot where the nest had been. The event proved, however, that it haunted the neighborhood of the oak-tree from an instinct of revenge, and was lying in wait for the destroyer of its family. During a whole week it hovered near the farm, biding its time, and at length the right moment arrived. The young man who had so ruthlessly exterminated the brood of owls was crossing the threshold of the farm at dusk when the bereaved bird swooped down on him from the tree where it was keeping watch, and with surprising swiftness tore out his eye with its claws. The intolerable pain caused by this sudden attack made the victim of it swoon away. When he recovered consciousness, and had his wound dressed, he related the circumstances under which he had received it, and a search was instituted to discover whether the owl was still lurking in the vicinity. No traces of it were, however, to be found; but the young man will have reason to remember the lodger in the old oak-tree, since for rest of his life he will have to make one eye do duty for two.

Bessemer Steel.

The London correspondent of the Manchester *Examiner* says : "The city of London has to-day done itself honour in conferring its freedom upon Sir Henry Bessemer, whose name certainly deserves to rank among those of most illustrous men who have signed the roll. Sir Henry is best known by his great invention for making steel, but how busy he has been in other directions may be understood from the fact that there are no less than 114 patents which have been taken out in his name. How valuable his steel process is we already know, but nothing could explain the extent of the revolution which his invention created better than the figures which he quoted this afternoon. When the invention was introduced into Sheffield the entire make of the steel was 51,000 tons per annum, whereas last year it was no less than 830,000 tons or more than 16 times the former produce of the country. The difference in price is still more wonderful. This year he estimates that 2,000,000 of tons of steel will be made in Europe and 1,000,000 tons in England, at a cost of £30,000,000, whereas, under the old process it would cost £150.000,000. The man whose genius has effected such enormous good to the community is entitled to to take a high place on the roll of national benefactors, and the city may well be proud to have him among her freemen.

THERE are two different ways of conducting stock business out West. The one is to buy young steers, keep them two years on your range, and sell them as four-year olds. Per head the increase in value varies between $10 and $15, thus enabling the ranchman to double his capital in a short time if his losses do not exceed five per cent. and he has luck. The other method is to raise stock, buying Texan, Oregon, or Utah cows and the necessary number of Eastern or English bulls. This, if you make up your mind not to sell a single animal in the first three years, is in the end more profitable than the feeding up of stock. At first few men went into it, the capital needed being large, but as in the last few years the larger profits of the business became known it is the favourite with men tempted by the chance of making a fortune in five or six years.

The Island of Madeira.

One of the principal drawbacks to Madeira is the difficulty of getting about. There are no carriage roads, and the horse tracks are steep pitches up and down; they ere also almost invariably paved with hard pebbles. This renders it impossible to ride anywhere except at a foot's pace, so that the time consumed in going a few miles is very great, and the mode of progression very tiresome. On the other hand, the island ponies, shod in a peculiar manner to encounter the aforesaid roads, are usually sure-footed and good walkers, so that within a certain distance of Funchal pleasant expeditions are to be made if you find the time and strength. Thus the fine mountain scenery of the Grand Corral—a gloomy gorge, into which you look down some 2,000 feet or so from the mountains overhanging it—the Ribiero Frio, and other landscapes beautiful of their kind, can on well-chosen days be visited without much difficulty. To get further afield is not so easy. There are but few tolerable hotels in the country districts, and you never can be sure that you will not find the higher levels wrapped in mist or drenched with rain, even whilst fine weather is prevailing. I am speaking of the winter months; anybody who happened to pass a summer in Madeira could visit all parts of the island readily enough.

The remark that there are few comfortable inns out of Funchal does not apply to Santa Cruz (Santa Cruz in Madeira, I mean). The hotel there belongs to a Senhor Gonzalez, but is mainly upheld by the untiring exertions of a worthy woman called Maria. She is a Portuguese by birth, but speaks English quite well, and is indefatigable in her efforts to please. This quiet inn is a pleasant change from the hot tables d'hotes at Funchal; the village may be perhaps somewhat cooler, and is said to possess a lighter and finer air; it is also well situated as a place to make excursions from. A mile or two beyond it lies the well-known Machicho Bay, where, according to the tradition, Madeira was first landed upon by the Englishman Machin. The story is that this Machin, an English esquire, incurred the resentment of a powerful family by gaining the affections of the daughter of its chief. He was thrown into prison, but escaped, and then persuaded the lady to elope with him to France. A violent storm drove their vessel for thirteen days in a southerly direction, and at last they found themselves in a small brig on the shores of an unknown island. Here they landed, but the fatigues of the voyage had exhausted the strength of Machin's companion, Anna d'Arfet; she died there, and was there buried. The fragments of a cross erected over her grave are still shown by the Machico villagers. Her lover did not long survive her, and his companions, in their attempt to sail away home, fell into the hands of the Moors. During their captivity they spoke of this island to an old Portuguese pilot, who, on being ransomed, and returning to his own country, suggested and accompanied the first expedition to Madeira, which thus became a dependency of Portugal. Skepticism, of course, has been at work upon this old national tale, but there seems no reason for rejecting the legend, except that it is a legend, and that the fashionable wisdom of the hour pronounces, as usual, anything which has long been a matter of popular belief to be of necessity incredible; otherwise the narrative hangs perfectly well together in all its parts, and, moreover, furnishes a reason why the Portuguese government sent out their expedition a little later to discover the island so reported to them—a reason which otherwise would be wanting. Beyond this bay you can proceed in a boat, along another range of rugged and lofty hills, to the supposed fossil beds at the extremity of the island: these fossils are apparently concretions of lime, which have put on the appearance of branches or roots, as the case may be. An ignorant person would believe that they had formed themselves round real pieces of wood, and that these have decayed, leaving their form to the encompassing stone; but geologists, I fancy, put this opinion aside, and look upon them as being what they are, merely in obedience to some caprice of nature; they are not, according to them, fossils at all, but merely a good mitation of fossils.

Two and a half millions of tropical oranges were received in the past six months at San Francisco from the French islands of Tahiti. They have come in equal numbers every month from March to September, showing that the trees are in perpetual bearing.

The Excavation of Flood Rock, Hell Gate.

The mining of Flood Rock, Hell Gate, in the East River at the northerly part of New York city, preparatory to blowing it up after the manner of the Hallett's Point work, is being pushed forward rapidly. The expenditure last year amounted to $140,000, and a large part of the $200,000 appropriated this year for the improvement of East River will go to this work. Employment is now given to 135 men, divided into three shifts of eight hours each. The central shaft is fifty feet deep.

Running across the river are twenty headings; at right angles to these are eleven cross headings, none of which have yet been extended their entire length. They average seven feet high and ten feet wide, and are situated about twenty feet apart. Near the main shaft, however, where more light and space are required for working, they are larger. Three acres have thus been undermined, or one-third of the whole. It is not intended to enlarge the headings until each one has been carried out to its full length. Then the chambers will be widened and made higher, so that the whole excavation will resemble an immense cave, the roof being supported by the rock pillars which now form the sides of the headings. The thickness of the rock forming the roof will then be about ten feet, varying according to the character of the rock, whereas it is now from fifteen to thirty feet in thickness.

The work of tunneling proceeds very slowly, owing to the hardness of the rock of which the reef is composed. The rate at which it is now going on is from 500 to 600 feet a month, representing an excavation of fabout 1,500 cubic yards. It is impossible to tell when the whole will be accomplished, even at this rate. Frequently a seam is struck in blasting which stops the work in that heading altogether, on account of the leakage. In such a case it is customary to work around the leak. According to the last report, the work done during the past year was much greater than in any previous year; 24,000 cubic yards of rock were removed, 43,000 blasts made, and 57,066 drills sharpened. The number of blasts made each night now average 150. The rock thus broken up is loaded on scows and dumped in the deep water to the south of the reef. Part of it was also used to fill up the space between Big and Little Mill Rocks, which lie to the north.

Diamond Cutting in New York.

Among the curious and interesting industrial facts brought to light during the census inquiries, not the least is the fact that the recently introduced art of diamond cutting has been so admirably developed here that diamonds cut in Amsterdam are sent to this city for recutting. Hitherto Amsterdam has monopolized the work of diamond cutting; and the aim there has been to remove in cutting the least possible weight of the gem. The American plan is to cut mathematically, according to recognized laws of light, so as to secure the utmost brilliancy for the finished stone. The greater loss in weight, as compared with the Amsterdam cutting, is thus more than made good by the superior brilliancy of the product. From the inquiries made by chief special census agent, Chas. E. Hill, it appears that the average increasing value given to diamonds by New York cutting is $5,000 for each person employed for twelve months; also, that our dealers are receiving the best Amsterdam-cut gems from abroad to be recut here and returned.

The lines of railway in the five divisions of the earth cost, in round numbers, $16,000,000,000, and would, according to Baron Kolb, reach eight times round the globe, although it is but little over half a century since the first railway worked by steam was opened between Darlington and Stockton, Sept. 27, 1825, and between Manchester and Liverpool, Sept. 15, 1830. It is shown that in France, previous to the existence of railway, there was one passenger in every 335,000 killed, and one out of every 30,000 wounded, whereas between 1835 and 1875 there was but one in 5,177,890 killed, and one in 580,450 wounded, so that we may infer that the tendency to accidents is yearly diminishing. Railway travelling in England is attended with greater risk than in any other country in Europe. A French statistician observes that if a person were to live continually in a railway carriage and spend all his time in railway travelling, the chances in favour of his dying from a railway accident would not occur until he was 960 years old.

A New Safety Sail Boat.

To the Editor of the Scientific American:

"Don't trust yourself in that craft; you'll be overboard sure." Such was the warning of a professional boatman at the barge office on the Battery, as I stepped upon a frail boat on a "fresh" afternoon. I think I know something of boats myself, and but that I knew this one to be provided with means intended to overcome the very danger against which the honest boatman warned me, I should have more than hesitated. But the pursuit of science must be deterred by no dangers, and, moreover, my pursuit in this instance was in behalf of the whole world, as represented by the *Scientific American*.

The Jane was an especially dangerous looking craft, 18 or 20 feet long, whose bottom and deck formed the sharp V-shaped edge which proclaim an entire want of bearing power, while her immense sails, main and jib, were ample for a boat of twice her dimensions. Her captain was a New Zealander, whose motions were the reverse of safety-inspiring. My own conception of the care needful under the existing circumstances had no place with him, and, but for entire faith in my ability to swim, I should never have ventured.

As the Jane shot beyond the pier head, her huge sails were struck by a blast more than sufficient for instant destruction. Involuntarily I made ready for an impromptu bath, and the boatman tauntingly called out, "What'd I tell ye?" but *only the mast yielded*. The boat came to her bearings and moved on as steadily as though impelled by the mildest zephyr. The triumph was already complete; but more was to come. Presently we were in a large seaway, and, with our good speed, a large inflow of sea water over the low and sharp bow was a matter of course. In that, also, I was agreeably disappointed. The boat, instead of carrying the weight of the wind and being thus forced *through* the sea, rose to it and she glided easily *over*. Again it was the mast that yielded—yielded to the motion of the boat as easily as before it yielded to the force of the blast. The surplus force of wind, instead of racking the boat and making misery for her passengers, was simply "spilled" over the top of the sail. The motion was free from the thumps and jars usual under the same circumstances.

How all this was accomplished may be difficult of explanation without the aid of an engraving. Instead of being "stepped" in the usual way, the mast was held in a rocking shaft at the deck, and to the keel, on either side, springs were attached, having their opposite ends secured under the deck. Thus the mast, in the absence of pressure, remained upright, but under pressure yielded on either side. The amount of pressure needful to compel this yielding was regulated by nuts and screw on a guide rod inside the springs. A second pair of springs, placed longitudinally under the deck, were connected by pulleys with the shrouds, and these aided to stiffen the mast while they yielded to its movements under pressure.

For pleasure boats, this spring mast is a great addition. It not only insures safety, but gives an ease of motion which cannot but prove especially delightful to those who are timid upon the water. More than this, it permits an unvarying course for the boat, and thus avoids the checks and delays inseparable from "luffing," as also the necessity of unusual skill and care in the management of even a "crank" vessel in a "flowy" wind.

M. S. B.

New York, October, 1880.

[The invention, a practical trial of which is above described, is that of Mr. John McLeod, Hill's Pavilion, Flushing, N. Y. A patent has been allowed. It appears to be a really valuable and practical improvement.—Eds. *Scientific American.*]

Gold in Arabia.

The official journal of the vilayet of Yemen, Sana, announces that a gold mine has been discovered in the Sana district, and, in the usual style of Oriental expansiveness, declares that this mine "is one of the richest in the world." A detachment of soldiers has been sent to guard the place against the attack of Bedouins, and a commission has been appointed to examine and report upon the mineral prospects. A productive gold mine would be a useful acquisition just now to the Turkish Government.

The Hibernian Bible Society has circulated in Ireland, since it was formed, nearly 4,5000,000 copies of the Bible.

The Pocket Handerchief.

We may forget our purse, our penknife, and many other things, says the London *Hatter*, without experiencing any great inconvenience, and even without its being known at times, but to lose or mislay the handkerchief, may be followed by very grave consequences, as we all know. Moreover, we make use of this article in many other different ways. All who make use of spectacles do not remove them from their nose in order to put them very carefully into the case without using the handkerchief, and they use it again before putting them on, wiping the glasses with great care. The majority of people pay by far too little attention to an object so indispensable. Many put it into the same pocket with their keys, their purse, their snuff-box, without troubling themselves concerning the many strange substances with which its tissue will not fail to come in contact in so miscellaneous a company, and which might sully the purity which the handkerchief ought to possess. Does one go to pay a visit? Before presenting themselves to the person they wish to thank or solicit, some have been known to dust their boots with the handkerchief. Does the careful wife see some grains of dust left on her ornaments? She makes them disappear with her handkerchief. Boys in the school room clean their slates with them; in the playground their handkerchief is the necessary attendant of a multitude of games. With this they wipe of the dirt; they strike off the dust. It is used to stop the blood that flows from wounds—always very numerous in the age of leap-frog and prisoners, base; the age also of communism in handkerchiefs. With wounds come tears, and the handkerchief, full of dust, spotted with dirt, with the blood of bodies known or unknown, serves again for wiping the eyes, the nose, or the cheeks furrowed with tears. We do not wish, and we cannot tell here all the strange uses that people make of the pocket handkerchief. And then what signals have been conveyed by it! How many sad farewells, how many cheerful congratulations!! The very method of waving it has a language, as the motions of the fan also have. But no one has hitherto discoursed on the language of the pocket handkerchief. And how useful it often is as a help to the pocket or the hand-bag! How many mushrooms, myrtle-berries, strawberries, and raspberries have been gathered into the handkerchief in young days, and more valuable things in later life! Then there may be evil results traced to it—a number of ailments of which one cannot guess the origin; diseases of the nose and eyes. Fortunate it is for him that incurs nothing worse; diphtheria, for example, which the handkerchief may heedlessly transmit. Let us not use the handkerchief except for its proper purpose; let us devote to it a special place; let us change it as often as possible, and inspire our children with a great disgust for another's handkerchief on account of the disagreeable, nay, dangerous consequences that may ensue. Much more might be said about the pocket handkerchief, but enough has been hinted at to set my readers a-thinking upon its importance, its uses, and its abuses.

Fifty-seven tons of Greek marble have been delivered in London, free of all charges, by the Greek Government, for the Byron pedestal.

The Marquis Robert de San Marzano, who married an American, Miss Helen Gillender, has ordered in this country some things for their baby. A willow cradle has a canopy decorated with draperies, medallions, points of Valenciennes lace, and blue satin ribbon. There are sheets with tucked borders and bands of French embroidery, and others of lawn, with lace enough on them to make the cost $500 for four. An eider down quilt and some exquisitely fine blankets are included in the outfit. There are three dozen dresses in the wardrobe, many of them of lawn, mull, and fine laces. "Young mothers," says a correspondent of the Philadelphia *Times*, "can easily imagine the dainty beauty of the tiny silken socks, the exquisitely embroidered lawn skirts garnitured with the finest of fine laces, the richest of the flannel skirts with silken embroidery, and the handsome tucked, trimmed, and lace-finished petticoats, but it is difficult to conceive of anything so lovely as the robes of real lace, arranged in diamonds, medallions, squares, and all manner of conceits, with applique of embroidery in roses and other flowers, each figure in the Valenciennes lace being punched or upraised until it looks like round point."

Breeding from Arab Sires.

(The Nineteeth Century.)

As size is a condition *sine qua non* for most purposes in England, I feel that something needs to be said on that head. I have every reason to believe that pure Arabian produce, bred in England, will in the first generation reach the height of 15 hands 2 inches, although his dam is hardly that height, and I believe it to be a fact that cross-bred produce from an Arabian sire is always taller than the mean height of sire and dam. That this should be so seems to me quite accountable. The Arabian of 15 hands is not a big pony but a little horse—little only through the circumstances of his breeding, and ready at once to develop as nature, under kindlier influences, intended him to do. It may seem a paradox to say it, but I believe size to be no less a quality of the racing Anazeh than speed. The English race-horse of 1700, if we may believe Admiral Rous, was under 15 hands in height, being then, as I have shown, by no means a pure Arabian, whereas immediately after the infusion of Darley blood he rose to 16 and 16.2. The soil and climate of England will, I doubt not, do now what it did then, and I think it is the Duke of Newcastle who remarks, "There is no fear of having too small horses in England, since the moisture of the climate, and the fatness of the land rather produce horses too large." Neither do I doubt that in Arabian cross-breeding a like result will be obtained. Lastly, the Arabian has this in his favour as a sire. He is less likely, from the real purity of his blood, to get those strange sports of nature which are the curse of breeders, misshapen offspring, recalling some ancient stain in not a stainless pedigree. The true Arabian may be trusted to reproduce his kind after his own image and likeness, and of a particular type. It will rarely happen to the breeder of Arabians that a colt is born useless for any purpose in the world, except, as they say, "to have his throat cut or be run in a hansom." Whether he be bred a race-horse or not, the Arab will always find a market as long as cavalry is used in England or on the Continent. He is a cheap horse to breed, doing well on what would starve an English thoroughbred, and requiring less stable work from his docility. Above all, whatever diseases he may acquire in time, he starts now with a clean bill of health, inheriting none of those weaknesses of constitution which beset our present racing stock. He endures cold as he endures heat, fasting, as plenty, and hard work as idleness. Nothing comes to him amiss. For what other creature under heaven can we say so much?

The Teeth of the Ancient Greeks.

(From the London News.)

One of the most remarkable features of the discovery of the band of Thebans who fell at Chæronea is that, according to the report, all the teeth of each member of the Sacred Band are sound and complete. Either these gallant patriots were exceptionally lucky, or the condition of teeth in old Greece was enviably different from that of later and more degenerate days. The Romans were well acquainted with the evils that attend on the possession of teeth, and had some considerable knowledge of the use of gold in counteracting these evils. If we remember rightly, an exception to the rule of not burying precious objects with departed Romans was made in favour of the gold that had been used for stopping teeth. We moderns may compare favourably with the Romans in the skill of our dentists, but we cannot pretend to rival the defenders of Thebes in their superiority to the necessity for these gentlemen. Rare, indeed, are the happy mortals of to-day who can truly boast that their teeth are in the perfect condition that nature intended, and that the craft of the dentist has never been employed upon them. It would be a difficult task to select from our Army, or any modern army, 300 men with teeth as sound as those of the Theban warriors are reported to be.

Two marble busts of the Prince Imperial have lately been finished by Mr. Best, the sculptor, one for Queen Victoria, representing the cadet at Chiselhurst, and the other for Gen. Simmons, which is to be presented to the Royal Military Academy, at which the ill-fated youth studied. It is said that the Empress will have the bodies of her husband and son brought to wherever she may pitch upon for her residence, and placed in a mausoleum there. She is in very delicate health.

SCIENTIFIC GOSSIP.

In the first of the series of his Cantor lectures, Robert W. Edis thus concisely states how decoration and furniture of town houses should be treated: "The great aim of the designer should be simplicity and appropriateness of form and design, with harmony of colour, and to show that the cheapest and commonest things need not be ugly, and that truth in art and design need not of necessity involve costliness and lavish expenditure. Fitness and absolute truth are essential to all real art, and be it remembered that 'design is not the offspring of idle fancy; it is the studied result of accumulative observation and delightful habit;' and by a careful regard to this we may make our homes and habitations, if not absolutely shrines of beauty and good taste, at least pleasant places, where the educated eye may look around without being shocked and offended by gross vulgarity and gaudy commonplaceness."

By means of an ingenious clock-work apparatus, Marey, the French biologist, has obtained a number of exceedingly interesting graphic illustrations of the manner in which man walks. The instrument is a vertical barrel, covered with finely ruled paper, and as the barrel is made to revolve by the gearing within it, a little pencil makes a mark on the paper, as the person whose walk is under investigation steps along with the registering device. A little air-compressor, worked by the foot of the walker at each step, sends a current of air through a flexible pipe to the instrument, and gives a more or less up-and-down movement to the pencil. It has been found that the step in going up hill is longer than in going down hill; that the step is longer for an unburdened man than for a burdened one, and that the step is longer when the sole of the boot is thick and prolonged beyond the toe than when it is short and flexible. When a person ascends a hill he quickens his pace, but diminishes its length, and he does just exactly the opposite when descending an inclination on the ground. It would seem that Marey's observations point to the advisability of pedestrians in general adopting low-heeled boots, with thick projecting soles.

The *Chemical News* gives the following pertinent piece of advice to the young student of science in Great Britain, and neither young nor old students on this side of the Atlantic need evade reading it at least. When a man has got so far as to define, even in his secret thoughts, science as a mere something to be examined in, he is intellectually dead. In conjunction with this caution we must make a demand upon the moral nature of the student. We must exhort him, at whatever cost of time and labour, to eschew cram, including under the term all the tricks and dodges by which a really undisciplined mind is made to put on a false appearance of mastership. It is not safe to argue that the English system of examination being essentially a sham it may be legitimately evaded. He who wins degrees and diplomas by deceit will have acquired habits of dishonesty which will cling to him in after life, and which will manifest themselves in a propensity for trimming and cooking results, for suppressing inconvenient facts, and forging evidences for a tottering theory. He who cheats examiners in youth will in after life be apt to cheat scientific societies and the learned world at large for his own glorification, and may perhaps for a time succeed.

The Tower of Silence.

On a hill in the island of Bombay (called by the Europeans Malabar Hill) stand, all within a short distance of each other, the churchyard of the Christians, the cemetery of the Mussulman, the place where the Hindoos cremate their dead, and the Tower of Silence, where the Parsees leave theirs uncoffined, to be devoured by the birds of the air. It is a lofty square enclosure, without roof or covering of any kind. Huge bloated vultures and kites, gorged with human flesh, throng lazily the summit of the lofty wall surrounding the stone pavement, which is divided into three compartments, wherein the corpses of men, of women, and of children are laid apart, and all nude as they came into the world. Some relative or friend anxiously watches, at a short distance, to ascertain which eye is first plucked out by the birds, and from thence it is inferred whether the soul of the departed is happy or miserable. The Parsees regard with horror the Hindoo method of disposing of the dead, by throwing the bodies or ashes into rivers; yet their own custom is even more repugnant to the feelings of the Europeans in India.

FACTS AND INCIDENTS.

The Swiss pleasure season has been the best for six years. Up to June 30 the Lucerne Steamboat Company had carried 40,000 more passengers than up to the same date last year.

A man leaped from a third-story window, in Philadelphia, to escape from his infuriated wife. His leg was broken; but that was nothing, he said, to what he would have suffered if he hadn't jumped.

Last December the London Peabody Fund of $2,500,000 had grown to $3,500,000. The trustees up to that time had housed 9,905 persons in 2,355 separate dwellings. The average weekly earnings of the head of each family in a Peabody house were $6, the average rent $1, and a single room 50 cents

Two Kentuckians had been stopping at a Chicago hotel. One of them was fiercely disputing the correctness of the bill which the clerk had just presented to him, when the other took him by the arm and said, "Colonel, never forget that you are a Kentuckian. Kill the clerk, but pay the bill."

The excitement consequent on the discoveries of new diamonds in the Free State of South Africa, according to latest intelligence, had not abated in intensity. Three new rushes have been reported. A gem of the first water, weighing fifty carats, and worth $30,000, has been unearthed at the Jagerstostein diggings.

Sir Charles Gavan Duffy's new work, on which he is now engaged, adheres to the old phrase with which he was himself identified from its inception to its collapse, and he calls his book "Young Ireland." It is not a history in broad and well-connected narrative, but a sort of personal memoir. O'Brien, Dillon, O'Gorman, and Meagher are spoken of very highly, but Michael is very severely handled.

The Swedish and Norwegian press are discussing in somewhat heated terms the agitation prevailing among a section of Norwegians for the repeal of the act of union between Sweden and Norway, and the establishment of a Norwegian republic. The Swedish journals, while hinting that the separation of Norway would be a good riddance, maintain that the honour of Sweden is involved, and that, if necessary, strong measures must be employed to reawaken the loyalty of the Norwegians. The relations between the Norwegian deputies and the King are greatly strained, the right of the King to a final veto having been denied by a large majority.

There has lately been published a very interesting official paper by Capt. Morant of the British navy, on the operations of the six vessels sent under command of the Duke of Edinburgh to give aid on the west coast of Ireland. The report says that the distress did not come suddenly on the inhabitants of this wild region by reason of the failure of last year's harvest, but was due in great measure to the falling off in value of kelp. This compelled the people to fall back upon tillage and fishing; but the crops capable of being grown are utterly insufficient to support the population, while the appliances for fishing are too imperfect to help much in sustaining the communities. The population is far larger than such a soil and climate can support, and the people have been imprudent in making very early marriages. Emigration is the only remedy for these people.

Dr. Louis Posse of St. Louis was married last July. Now his wife is suing for a divorce. Her chief cause of complaint is given in her testimony as follows: "We had a roast duck for dinner, with onion stuffing. When he saw the onions he got just like a wild man and threw down his knife and fork, cursed me and called me names, and asked me what kind of eating that was. He wouldn't sit down to the table then, but went and sat down in the kitchen. I wasn't eating then, and he asked me why I didn't eat. I said to him, "If you will not eat I will not eat either." He then said, "If you don't sit down this very minute and eat, I will show you who is boss in this house, you or I." He forced me to go to the table and sit down, and I took some victuals on my plate just to please him, but I couldn't eat. He then went and got a stick and stood behind my chair and said to me: "Here, do you see that stick? That is for you, and if you will not eat now I will break this stick on your back. I will break every bone in your body. Fill up your plate and eat." I even filled my plate for good, and he kept standing behind me till I had the whole plate emptied."

GRINLETS.

"A Terrible Infant!"

I recollect a nurse call'd Ann,
Who carried me about the grass,
And one fine day a fine young man
Came up, and kissed the pretty lass;
She did not make the least objection!
Thinks I, "Aha!
When I can talk I'll tell mamma."
And that's my earliest recollection.

They had just exchanged their rings,
And sat on the sofa together,
Discussing the subject of weather
And several others things.

It was midnight ere he rose.
And a bit of court plaster
From her cheek of fair alabaster,
Was stuck on the end of his nose.

"How is your husband this afternoon, Mrs. Quiggs?" "Why, the doctor says as how if he lives till mornin' he shall have some hopes of him; but if he don't he must give him up."

When a boy is ordered against his will to take the coal-scuttle down stairs and fill it, it is astonishing the number of articles he will accidentally strike the scuttle against before getting back.

The European powers to Dulcigno—Will you surrender? Dulcigno to the European powers—No, I won't. The European powers to Dulcigno—Then we think you're real mean—so, there!

A bright little girl, who had successfully spelt the word "that," was asked by her teacher what would remain after the "t" had been taken away. "The dirty cups and saucers," was the reply.

The following letter was received by an undertaker recently from an afflicted widower: "Sur—my waif is ded and wonts to be berried to-morrow at Woner klock. U nose wair to dig the Hole—by the siad of my two other wiafs—let it be deep."

Lawyer C——(entering the office of his friend, Dr. M——, and speaking in a hoarse whisper: "Fred, I've got such a cold this morning that I can't speak the truth." Dr. M——: "Well, I'm glad that it's nothing that will interfere with your business."

A certain English general, being at the point of death, opened his eyes, and seeing a consultation of four physicians, who were standing close by his bedside, faintly exclaimed: "Gentlemen, if you fire by platoons it's all over with me," and instantly expired.

Maj. Dunnup—Awf'lly dull down here, isn't it, Miss Maria? Miss Maria—Do you think so? Why don't you go, then? You're a bachelor, and have only yourself to please. Maj. Dunnup—Only myself to please! You dont know what a doosed difficult thing that is to do.

The Irishman had a correct appreciation of the fitness of things who, being asked by the judge when he applied for a license to sell whisky if he was of good moral character, replied: "Faith, yer honour, I don't see the necessity of a good moral character to sell whisky!"

Here is a verbatim sample of a preacher's prayer of a coloured camp-meeting at Seneca, Md., last summer: "Oh, Lord! send down thy spirit! Let down de right foot ob Thy power! Oh, Lord! mount de gray horse ob Zion, an' come down an' stir us up wid long poles."

Just as a Brooklyn citizen called his five-year-old son into the house, the other day, a playmate gave the boy a slap in the face, and he ran to his father for protection. "My son," said the fond father, "when a boy hits you like that, you must always strike back." "Oh, papa, I did. I hit him yesterday."

When old Mrs. Bunsby had got through reading in the morning paper an account of the last fire, she turned her spectacles from her eyes to the top of her head and remarked: "If the city firemen would wear the genuine hum knit stockints, such as we make and wear in the country, they wouldn't be a bustin' of their hose at every fire."

The base-ball season has ended, and the mellifluous mouthings of the umpire, as he manfully argues with the second-base man, are hushed. The arnica market is dull, and the new wing for the hospital will not need to be built for another season. The base runner has "got under" for the last time (we wish some of them had), the home plate and got a "slide," "fly" time has passed, the has only batter in the land is in the griddle-cake pan. The boys have earned this run.

THE CANADA LUMBERMAN

AND MILLERS', MANUFACTURERS', AND MINERS' GAZETTE.

ISSUED SEMI-MONTHLY AT TORONTO, ONT.

"Rome was not built in a day." Our patrons will kindly bear with the LUMBERMAN, for a few weeks until fairly under way. In the meantime send in the subscriptions. We have had to write out a number of receipts and enjoy the exercise.

A NEW AND VALUABLE INVENTION.

Mr. Finlay Ross, of Byng Inlet, has invented and patented a gang of circular saws, which will probably supersede the ordinary stock gangs of upright saws. Mr. Ross can, by a simple contrivance, arrange on one mandril any required number of saws, which may be taken off at pleasure, as easily as the ordinary gang by shifting a key and coupling, placed near a pulley at each end of the mandril. The inventor claims that his gang of circulars will cut a much larger quantity of lumber than the usual gang, and that the face will be smoother. Another advantage claimed by Mr. Ross is, that as the saws are arranged so as to run *with* the grain of the timber they will cut easier and make smoother work than the ordinary circular saw revolving *against* the grain of the log. The logs are fed with press rollers in the ordinary way. There seems to be a mine of wealth in this simple invention, when fairly introduced.

A WARNING.

A writer describing the lumbering operations on the Penobscot river, State of Maine, refers to the City of Bangor, at the head of navigation on that river. He says, Bangor contains between 17,000 and 18,000 inhabitants, and it never can grow larger. In the past it has been noted for its immense lumber trade, but now that business is rapidly coming to a close. Up to 1872, lumbering was carried on briskly at Bangor,—now a large number of saw mills have discontinued operations, and the humming of saws, the puffing of tugs, the rafts of logs and the crowds of lumbermen which once frequented them, are sights and sounds which are seen and heard no more. Here was a region settled in the latter part of the 18th century, and lumbering had been its chief industry for about 50 years. The axe of the lumberman and the saw of the mill had done their work in depleting the forests of their grand old trees.

The river, for miles, was lined with saw mills. These mills so filled with animation, so lucrative to their proprietors, are now gone into disuse. The haste and waste, with which the forests were cut down and the timber sawn into lumber, compelled the abandonment and brought the growth of the city of Bangor to a standstill.

THE MINERAL WEALTH OF CANADA.

In every Province of the Dominion, discoveries are frequently being made of gold, silver, and a host of economic minerals. Nova Scotia has for years been celebrated for its gold bearing quartz. The latest special item from that Province is that a fine bar of gold from the Yarmouth Greenpot mine has been shown to a St. John *Telegraph* reporter by Mr. Henderson, the secretary of the company. It weighed 42 ounces—four ounces less than the last specimen from that mine exhibited, but is much purer—and is worth in the neighbourhood of $800. The company intend shortly putting in machinery that will crush fifteen tons a day instead of three as at present; this can be done at but trifling cost, and with but few additional hands. The prospects of this mine are said to be excellent.

The Halifax *Mail* says.—The Tangier gold field is being rapidly developed, and promises to be one of the richest in the province. A few days since a son of Mr. Timothy Archibald, who owns and runs the line of stage-coaches that runs to the eastward, discovered a lead near Salmon River, in the Tangier district, which is thirty-three inches in width, and from the indications given by boulders on the surface, and by quartz taken just below, will prove of unusual richness. A company has been formered to work the new mine, and operations will be vigorously pushed. Another lead, thirty-six inches wide, has also been recently discovered in the same district. Surface samples that have been taken out, crushed, and assayed show an average yield of ten pennyweights to the ton. A handsome brick of gold, valued at $1,100, was shown us to-day. It was taken from the mine at Moose river, owned by Messrs. J. R. Johnson and W. G. Cole. This mine is yielding very fair returns, and this last crushing is the result of thirty days' work for five men.

From Pictou six thousand and twenty tons of coal were shipped last week, making the total shipments to date 231,708, Following are the figures:—Halifax, 171; Acadia, 1,106; Intercolonial, 2.259; Vale Co., 2,482; total 6,020. Total to date—Halifax, 86,202; Acadia Co., 46,791; Intercolonial Co., 49,627; Vale Co., 46,082; total 231,708.

Word comes that the Lake George, N. B., Antimony Mining and Smelting Co. have struck a large vein of silver ore, the specimens shown being very rich. This mine is employing from 25 to 50 persons, and has made two shipments of very pure ore to Great Britain lately; and that Mr. Hibbard's mine has been sold to the Hibbard Antimony Mining Company for $200,000, one half paid in cash and the other half in the stock of the company.

A large mineral belt has been discovered in Cape Breton, between Marble Mountain and Malawatch, in which gold, silver and copper are found.

In the Province of Quebec, the discovery of a gold nugget weighing six ounces is reported from the Delery concession, River Gilbert. Mr. Delery has formed a new company to work the precious metal, under the name of the East Branch Gold Mining Company. Copper mining is also profitably carried on in the Province.

A glance at the Ottawa Valley shows, according to a sketch recently furnished by Mr. Garret, a trust-worthy geologist residing at Ottawa, that a very large number of economic minerals are found in that valley. He first refers to Apatite (phosphate of lime) which is found in abundance in that region, and as an economic fertilizer has developed itself to such an extent as to claim the rank of a staple and indispensable mineral. Year by year it continues to be developed, and the promise for the future is bright and substantial.

Felspar is abundant. Mr. Garret thinks, that as the grey variety which is important in the manufacture of porcelain chinaware, manufactures might be established with profit, for the production of ceramic materials.

Plumbago, in large deposits has been discovered and worked. The ores are rich in pure and "dissimated" quality. Liberal capital, labour and patience have been expended to carry forward this valuable enterprise, to perfect the manufacture, and it is acknowledged, in pencil work particularly, equal, if not superior to the best European stock.

Molybdenum—a new species of graphite was recently discovered in the County of Renfrew and is now being brought into a commercial position for export. The market is limited and only for exportation, at $1, 000 per ton. Its proclivities for location is mostly confined to the neighbourhood of iron and plumbago.

Mr. Garret, also mentions as products of the Ottawa Valley, nickel, (oxide), manganese, baryta, (sulphate of lime), asbestos, bog iron ore, iron pyrites, antimony, celestine or stontia, copper, iron ore. silver, gold, soap stone, syenite, or granite, mica, marble, peat, and marl. Mining in the Ottawa region gives employment to a large number of men.

Iron mining is becoming a large industry in Madoc, Marmora, and further westward in the range of townships extending toward Lake Superior.

Gold has been discovered near Perth, which yields $128 to the ton. The mine is situated on a lot of one hundred acres, about seventeen miles from the town, and is the property of W. Hicks, who, with several other gentlemen, are arranging to develope it.

The lake Superior region is well known to be rich in silver, gold and copper.

From the region near the Lake of the Woods, it is reported that Mr. E. Faye, an engineer lately in the employ of the Pacific Railway has found specimens of rich gold bearing quartz. Some of the nuggets were as large as peas, while in much of the quartz the "flower gold" showed the glittering particles profusely all through. Mr. Faye reports the discovery of silver, copper and asbestos. The mineral is found chiefly on the rocky islands, which are interspersed throughout the lake.

Those discoveries were made near Rat Portage. Mr. Faye has obtained 25 cents' worth of gold from three-fourths of a pound of ore, which is equal to $666 per ton, and there is every reason to believe that the gold mines in the that section will pan out fully as well as its discoverers are led to believe.

In the North-west Territories coal is found in abundance; and towards the Rocky Mountains, gold in sufficient paying quantities has been already obtained. Passing on to British Columbia—that Province is rich in gold, silver and other valuable minerals.

When to this is added our salt and petroleum springs, it is evident that the Dominion of Canada has, within itself, enough mineral wealth which only needs development, to add immensely to the producing industries of the country.

NOTES FROM GEORGIAN BAY.

Last week we intended visiting the saw mills at Midland and vicinity before they closed down for the season, but found that time did not permit the trip to be extended farther than the Waubaushene and Severn mills. The latter mills closed on Thursday, the 21st inst., to allow the men to go to camp for winter operations. The past season's work at the Severn mills has been satisfactory. There is yet on hand in the mill yard about 6 million feet of lumber. Probably about 3 million feet of this will be transferred to Waubaushene docks before the close of navigation. The Waubaushene mills were in full operation, and likely to continue at work for two weeks yet or longer, as a further supply of logs is expected. The mills are situate at the mouth of Matchedash Bay, on the Midland Railway, which has six tracks running through the mill yard, and a leading track extending along the dock, where barges unload lumber intended to be conveyed by railway from the Severn mills, about four miles distant. This extensive and complete establishment, which gives employment to over 150 men, during the summer season, is a pattern of neatness and convenience. A church and schoolhouse have been erected by the Company (Hon. W. Hodge & Co., New York,) for the accommodation of the workmen. Similar accommodation is provided by the Company at the Severn mills, which also gives employment to over 150 men. The Company have also erected a large building, with 26 bedrooms, for the use of parties having business to transact at the mills, as well as for transient travellers. This is named "The Dunkin House," which, as its name indicates, is a temperance hotel. The temperance principle extends over the whole Company's works, it being a stipulation with employees, when engaged, that they shall abstain from intoxicating drinks while in the Company's service. The present landlord of "the Dunkin House," is Mr Perkins, measurer and culler. He keeps an excellent house, at the ordinary charge of $1.00 per day.

It may be noticed here that the Waubaushene establishment is head quarters of several extensive saw mills on the East coast of the Georgian Bay, incorporated about ten years ago, at the instance of the Hon. Mr. Dodge, of New York, and others, under the names of the Collingwood Lumber Co. (at present under the management of Mr. D. G. Cooper;) the Georgian Bay Lumber Co., (including the Waubaushene and Severn Mills, under the management of Mr. T. W. Buck;) the Parry Sound Lumber Co. (mills at Parry Sound, since sold to J. C. Miller, Esq.,) and the Maganetawan Lumber Co., under the management of Mr. J. H. Buck. The general supervision of the whole concern is vested in Mr. T. W. Buck, Waubaushene, who has proved himself a very capable manager. We had not the pleasure of seeing Mr. Buck on this trip.

Besides the powerful propeller Maganetawan and the tug Hayes, the Company have a handsome steam yacht, which when in port is protected from the weather by an enclosed shed built alongside the dock. Preparations are being made to have another steam tug, 90 feet keel, built this winter.

Each establishment belonging to the Company is provided with a well-appointed machine shop, so that everything is kept in the very best repair. The manager's residence—a handsome mansion—is built on a rising ground, a short distance south, commanding a complete view of the bay and mills. The office and general store are near by the mills, and together with the workmen's residences, make quite a village, Every branch of the work is thoroughly systematized, so that, for instance, if a sale of lumber is made, the manager can tell, from the reports sent in to him, where a certain pile stands, its quality, etc., without leaving his office.

To give some idea of the extent of the business done at this place, it may be stated that one day lately there were one hundred and six cars of lumber and square timber in the yard consigned to points over the Midland Railway, principally for eastern markets.

Wages during the summer range from $25 to $35 per month—paid, the workmen say, promptly and regularly. In the woods at present, wages range from $15 to $18, so that the rate during winter, with board, is equal to the summer rate, without board.

Towards Midland, along the railway, are Tanner's mills and Christie's mills, each of a capacity of turning out 25,000 to 30,000 feet per day, and Power's mills,—capacity 75,000 feet per day.

On the Midland Railway, towards Orillia, is Mr. Ross's mill, at Fesserton, about two miles east of Waubaushene. This mill has a capacity of about 25,000 feet per day.

At Coldwater is the shingle mill of Mr. Lovering, and that of Messrs. Hall & Co. They turn out a large quantity of shingles each year.

At the Alma station, another mill ha just been put up by Messrs. Wyley & Tait. When it is completed, which it will be in a month or six weeks, its capacity will be 25,000 feet daily, besides two shingle machines, capable of cutting 40,000 *per diem*. There is also a lath machine attached. Mr. Wyley will have the management of the working of the establishment, and as there is a good supply of timber convenient, will be likely to make the concern pay well.

A little farther east is Mr. Haddin's mill, and at Utoff station, another mill, run by

Mr. Overend, both are doing a good business. Although the woods in the neighborhood were worked over by lumbermen ten years ago, there will be found enough timber to keep these mills running for eight or ten years yet. Reaching Orillia, we come to Andrew Tait's mills, with a capacity of 25,000, and two shingle machines of a capacity of 40,000 *per diem*. A local paper, recently referring to this mill, says :—

Mr. Tait came here some fourteen or fifteen years ago, and started a little shingle mill on the premises still occupied by him, and by industry, perseverance, and business tact he has succeeded in bringing up his trade to its present dimensions. Visiting the establishment a few days ago, we found a large number of workmen employed in the various departments of bringing up timber to the saws, to be cut into boards, shingles, and square timber, measuring, piling, shipping, etc., the machinery used enabling the men to do their work with great despatch. But though Mr. Tait does an extensive lumber business in his own mills (for he has several), yet he passes, possibly, as much through his hands as an agent, and thereby considerably increases his income. It is in this way of turning over large quantities of stuff, rather than by large profits that Mr. Tait makes money, for, after all, the large profits talked of in the lumbering trade, are more imaginary than real.

OUR QUEBEC LETTER.

THE LUMBER TRADE—THE GREAT SALE OF CROWN LANDS—ENGAGING MEN FOR THE SHANTIES—NEXT YEAR'S SUPPLY—PRICES CURRENT.

QUEBEC, 25th Oct.—The most important event in the timber trade since the date of my last letter, is undoubtedly the recent great sale of timber limits by the Crown Lands of the Local Government. It is an encouraging sign to those engaged in lumber, that the prices obtained were much higher than have been paid for many years past. Nor can these prices be attributed in my estimation to any sudden excitement in the minds of buyers from the competition of the auction, or even from extravagant and speculative anticipations of further improvement in trade. The attendance at the sale included all the best known lumbermen from the districts of the Ottawa, Three Rivers, Quebec, and St. John N. B. The purchasers were principally found to be of the most cautious, conservative, and experienced operators of the country, Most of them had either personally investigated the limits upon which they bid, or possessed confidential information from explorers employed by them. Close observers at the sale noticed that some of the lots sold were knocked down to parties, who were undoubtedly buying for leading capitalists sitting near them. Several of such were present; — well-known business men, who though not actually engaged in lumbering operations themselves, have been in the habit of advancing large amounts to those actually engaged in the trade. Larger prices than would have been otherwise realized, were doubtless in some degree obtained by the prevalence of the impression that the pine limits offered at this auction were amongst the last really first class wooded lands remaining in the hands of the Government of Quebec. Three hundred and forty-five dollars a mile is undoubtedly a big price, but there are in the trade very few who would care to insinuate that the money paid for the lands in block "A" of the Upper Ottawa Agency is too high. If the reports of the railway surveying party which explored this portion of the forest some ten years ago are to be credited, most of the purchasers of these lots will realize fortunes out of them. For some few years to come they can of course look for no return, their lumber being in the main, quite inaccessible. The Federal Government will have to be looked to, for improvements in the streams; but as the pine becomes more scarce, these improvements will have to be made as a matter of course. It is too, by no means improbable, that some of these lands will be partially opened up by the contemplated extensions of the various lines of railways in the district of Ottawa. Speaking of railways reminds me of the fact that several operators in the Ottawa district are seeking to make terms with

THE Q. M. O. AND O. R. R.

for the conveyance of their lumber to Quebec next season, by this line, instead of by water. I do not think it necessary to give here the prices obtained and the names of the purchasers at the Local Government sale of timber limits, since they have all been published in the daily papers. The Provincial Treasury has been swelled by the sale to the extent of some $262,000. Whether or not the Honorable Commissioner of Crown Lands has served the interests of Quebec's future by throwing all these valuable lots into the market together, will be judged of better hereafter than now. The trade has certainly no ground of complaint in the matter, since no one apprehends another glut in the market.

SHANTYMEN.

The local timber brokers and agents of western lumbermen are busy engaging shantymen. This is a much less easy matter this fall than it has been for some years past. Fortunately for themselves, and consequently for general business, the number of unemployed workmen is now much less than it has ever been since the commencement of the late financial depression. Some hundreds of men have been already sent to the bush from this city and ninety more leave to-night. Of these, the greatest number are bound for the oak forests of Ohio and Michigan. Wages run from $24 per month for hewers to $45 and $46 for broad axe men. Almost all of this batch are French Canadians. After this date it will be difficult to engage many many more shantymen here this winter.

SALES AND PRICES CURRENT.

Within the past week or ten days a great many sales have been made for future delivery. Something like 500,000 feet of oak have been sold in various lots at the undermentioned prices :—

Oak, Ohio, 70 feet, average....50 cents.
" Michigan, 60 ft. " ....48 cents.
" Canada, 60 ft. " ....45 cents.

Nothing has been done here in pipe staves since the date of my last letter. Quotations remain as before. For West India, white oak—$80 can be had on contract.

West India, red oak, could be sold 1¼ thick, for $74.

Board pine, 20 inch string, 33 cents. A quantity has been contracted for at this price.

In elm and birch there is nothing doing. Hickory, 45 feet average, commands 32 cents per cubic foot.

Black walnut is scarce and in demand.

Western ash, 14 inches and upwards, 32 cents.

MINING NOTES.

Mining intelligence just now is almost *nil*. The rights of the Canada Gold Mining Co. in Beauce have been bought up by Mr. De Lery and others, who are forming themselves into a new Co. A large development is looked for next year in the phosphate industry, owing to Canada's wealth in that direction having attracted the favourable attention of French capitalists.

THE CREDIT FONCIER.

The capital stock of this institution has all been subscribed in France, and Mr. Thors, Assistant Manager of the Bank of Paris has arrived here to enquire into the resources of the country and report upon the advisability of increasing the capital to 50,000,000 francs. Money is certainly cheap enough here at present, but this influx of foreign capital will doubtless cause a further reduction of one to two per cent.

THE SEASON OF NAVIGATION.

will be closed here in about a fortnight. Already the ship labourers are leaving to seek employment for the winter in the southern ports.

STADACONA.

The Brockville lumber shippers have presented a beautiful epergne to Mr. J. A. McKinnon.

Mr. Milne, of the township of Scarboro', whose saw mill was destroyed by fire last week, estimates his loss at $22,000, on which the insurance is only $2,000. He will commence re-building at once.

OUR PARRY SOUND LETTER.

ACTIVE OPERATIONS—SHIPPING—STEAM BARGES—LUMBER CAMPS.

Parry Sound, Oct. 23, 1880.

The season's operations, as far as sawing is concerned, are drawing to a close, but yet considerable remains to be done. To expedite shipping, J. C. Miller, Esq., M. P. P., has purchased a steam barge and schooner rigged consort. They will carry about 700,000 feet of lumber, each trip, and left this week with a full cargo for Tonawanda.

Men are at work in the woods getting out next season's stock.

The Ontario Bank is estimated to take out seven million feet direct, this ensuing winter, and three millions under contract by Messrs. S. & J. Armstrong, of McKellar, lumber jobbers.

J. C. Miller, Parry Sound Lumber Co., will take out with his own men about ten million feet, and per Messrs. Armstrong, three millions, which is about the same quantity he took out last winter.

The Maganetewan Lumber Co., Byng Inlet, (J. H. Buck, Manager), will, with their own men, take out about eight million, and by Messrs. Armstrong, in the Townships of McKenzie, Hagerman, Ferrie and Croft, about six millions. Mr. Isaac Cockburn will take out about five million feet for the same company, *via* Doe Lake, and Maganetawan River.

Mr. Wm. Beattie, Parry Sound, will take out with his own men about three million, in the Township of McDougall, and by Messrs. Armstrong, in the Township of McKellar, about one million.

Mr. O. F. Wright, of Barrie, is operating in the Townships of McKellar, McDougall and Smith taking out pine. He also has a gang of men at work takiug out oak. The oak after being drawn to Parry Sound on sleighs, will be shipped thence by water without transhipment to Quebec.

Mr. Wright has two gangs of men at work taking down board timber by the Shawanaga river.

Mr. Lewis Stiller, is also taking out three million feet, by the same river, for Mr. Beck, of Penetang.

Operations are also progressing in Moon river.

Mr. Neagle is taking out board timber on South river emptying into Lake Nipissing, this will come by French river, the first raft by that route came down last season.

Messrs. McDougall & Smith are operating on the north shore of Lake Nipissing where there is some fine timber.

Messrs. Armstrong have five camps, with about 120 men at work.

Wages range at from $12 to $18 per month, hewers from $35 to $40.

SEGUIN.

FROM MIRAMICHI.

Our Chatham, Miramichi, correspondent states that shipping continues brisk from the different stations on the Miramichi river. Notwithstanding the large number of logs "hung up" but very few ships have been delayed in loading.

The stocks of deals at the different mills are much less than they have been for many years, and there are yet expected to arrive, some 15 or 20 vessels, which will still further reduce the winter stock. Had all last winter's logs been brought to the mills and been sawed up, the stock remaining to be held over would fall far short of what it has been for many seasons past. The lumber trade has never been better than at present here.

Large numbers of logging parties have been in the woods for some time, and many are just preparing to go (Oct. 22nd.) Logging will be carried on more extensively this winter than last, but our merchants will have to act with great caution in making contracts owing to the uncertainty of getting logs to market the same season they are cut. This arises from the fact that the greater portion of the logs are now cut on a small stream far from the main waters of the Miramichi, and in spring especially, when there is not much snow, as was the case last winter, the water is so scarce that thousands have to remain until the fall rains.

About 10,000,000 feet of last month's logs are expected at the rafting ground this week, some of which may be down to the mills next week, but few of them will likely be cut this fall, if not absolutely required to make up cargoes.

The recent rains have caused St. John river to rise five feet, and the gain of logs at Grand Falls has been in consequence broken. A considerable quantity of timber has also been set free on the Miramichi river.

A YOUNG Mecklenburg noble went recently to Monaco with an old family servant, and won at a sitting $60,000. Judge his amazement when on the next morning the old and trusted servant was nowhere to be found, having fled and taken the money with him. The man, it was presently discovered, had taken the money to the young noble's home, that it might be safely out of harm's way.

REID & CO., WHOLESALE LUMBER DEALERS. Lumber, lath, shingles, &c. Car lots to suit customers. Best culls in the market for from $6 to $7 per M.
OFFICE ON DOCK—Esplanade, foot of Sherbourne Street, Toronto. 2in

DISSOLUTION OF PARTNERSHIP.

THE PARTNERSHIP HERETOFORE existing between GEO. BENGOUGH and WM. DINGMAN, as Machinery Brokers, has this day been dissolved by mutual consent. All accounts will be settled, and the business carried on by Geo. Bengough under the name and style of Wm. Dingman & Co.

TENDER FOR COAL.

Sealed Tenders will be received by the undersigned until the evening of Friday, the 5th of November, for the following supplies for the Ontario Agricultural College, Guelph :—

200 TONS SOFT COAL.
50 TONS HARD COAL.

The Stove coal to be Scranton or Pittston. The tenderer to name varieties and prices of Soft coals. Coal to be well screened, and free from slack, and to be delivered satisfactorily at the Institution as required during the month of November. For forms and conditions of tender apply to
JAMES MILLS,
President.
Guelph, Oct. 23rd, 1880. 1.

Andrew Mercer Ontario Reformatory for Females.

Tender for Labour of Inmates

Offers addressed to the undersigned will be received up to noon of
WEDNESDAY, 10th NOVEMBER,
for leasing for a term of five years the labour of fifty or more of the adult female prisoners committed to the REFORMATORY FOR FEMALES, TORONTO, together with the requisite amount of shop space, properly heated and lighted, which is all the Government will furnish.
Tenderers will require to state the number of prisoners required, the exact nature of the industry it is proposed to carry on, and the amount of shop-room required. The highest or any tender not necessarily accepted.
The shops and premises may be seen any day, between the hours of two and five p.m., and any further information may be obtained from the undersigned.
J. W. LANGMUIR,
Inspector of Prisons and Public Charities.
Parliament Buildings,
Toronto, 26th Oct., 1880. 2

King of the Cannibal Islands.

A TALK WITH THE GOVERNOR OF THE ISLANDS OF FIJI.

The newly-appointed governor of the Fiji islands, George W. Des Vœaux, and staff rrrived from England a few days since. He left this city yesterday en route for the Fiji island. A reporter for the *Graphic* called upon Gov. Vœaux at the Fifth avenue hotel and obtained much interesting information concerning that almost unknown and greatly misrepresented group of islands. Of the present condition of the Fijis and their commercial relations with other countries the governor said he could speak from personal knowledge, having spent many months there.

"To begin with," he said, "I will say that the natives are no longer cannibals, but all of them are civilized and Christians. The islands since 1874 have been under British rule, the ex-King Cakoban having ceded his domains to Queen Victoria, only asking in return that England take future control of them. Since that time great prosperity has been the result. Our farmers received the gold medal at the Centennial exhibition, the Paris exhibition, and at the Sydney exhibition for Sea Island cotton. They also took the gold medal for coffee at the late Sydney exhibition. The growth of cotton has only been recently introduced on the islands, but is making great strides. In the production of sugar much progress has been made, and in the next few years large crops will be exported. A Sydney corporation has recently invested £150,000 in sugar plantations, and it is expected that other companies will follow, the climate being excellent for the growth of sugar cane. There are many thousands of acres of land on the larger islands set apart for the production of cocoanuts, and quite a trade has been established with the Sydney and Australian colonies. The copra, which is really the meat of the cooanut, is valuable and turned into oil. The coffee yield in the third year after plantation is excellent and has, in many instances, flowered in the second year. The labour market is all that is needed. The government does not encourage the employment of native labour at a distance from their homes, as it tends to decrease the population of the Islands. Abundant labour can be obtained through the government from the Solomon islands and New Hebrides at a very cheap rate. The cost to the planter with food is less than 1s. per day. Emigration has lately been started with the Indian colonies, so as to provide for any demand that may be made by reason of the extra cultivation of land. These labourers are generally engaged for three years, and receive their pay at one time, at the end of the contract, which cannot exceed that period. Then they are sent home, and if they choose to return they can do so after a limited time. They are paid through the government, and the only cost to the planter in the three years is the price of the importation and return of the men.

"Trade, in various commercial productions, is growing rapidly, and in the next year or two it is expected to be still more enlarged. The revenue returns, before the Islands were ceded to the English government, amounted to about £13,000. In 1878, after four years of the present administration, the returns footed up £70,000, and last year £90,000. The white population now numbers a little over 2,000, and the native 100,000. Last year the births exceeded the deaths to a large degree. The area of the Islands is about 80,000 acres, and the inhabited part is greater than the whole of the West Indies. The largest and representative island is Fiti Levu, about the size of Jamaica, and the second of importance, Suva, similar to that of Porto Rico. The climate is wonderfully good for that of a tropical country, and there is an utter absence of malarial fever, the only disease being dysentery, occasioned by poor living, and drinking to excess. The natives are by no means of an indolent disposition as one would imagine. A large number of them employ themselves in cultivating cotton or cocoanuts on their own account, and as a whole, are a peaceable race. There are no European soldiers on the islands outside of those attached to the government department. The Islands are divided into ten provinces, and each is governed by a sub-governor, or roka, as they are termed. These are assisted by the advice of a European magistrate. They make a return of about £20,000 to the government yearly on account of expenses. The colony is self-supporting, and pays for a mail between Sydney and Viti Levu.

"Cannibalism is a thing of the past. No more of it is seen or ever will be heard of again. The natives have become Christians through the agency of the Wesleyan churches and the Roman Catholic missionaries. In 1876 there were some ten thousand cannibals, who chiefly resided in the mountainous interior of the Viti Levu. They committed serious outrages upon the coast natives, and to-day all of them are as peacable and as loyal as one could wish them to be.

Bathing.

It is important to recognize that the only virtues of water as used by the bather are two—namely, its value as a cleansing agent, and as a surface stimulant. In this last capacity it simply acts as a medium affecting the temperature of the part to which it is applied, or which is immersed in it. Right views of the fact in reference to this matter are important, as there can be no question that some persons overrate the uses of cold water, and run considerable risks in their pursuit of them. Every beneficial action that can be exerted by a bath is secured by simply dipping in the sea, or a very moderate affusion of cold water! Except in cases of high fever, when it is desired to reduce the heat of the body by prolonged contact with cold, a bath of any considerable duration is likely to be injurious. Then, again, it is necessary to recognize the risk of suddenly driving the blood from the surface in upon the organs. The "plunge," or "dip," or "shower," or "douche," is intended to produce a momentary depression of the temperature of the surface in the hope of occasioning a reaction which will bring the blood back to the surface with increased vigour, and almost instantly. If this return does *not* take place; if, in a word, redness of the skin is not a very rapid consequence of the immersion, it is impossible that the bath can have been useful, and in nine cases out of ten, when the surface is left white or cold, it does harm. The measure of value is the redness which ensues promptly after the bath, and this reaction should be produced without the need of much friction, or the bath is not worth taking.

Water Telescopes for Watching the Movements of Fish.

I have read somewhere a good account of water telescopes. I think it is in Galton's "Art of Travelling," which is full of information. I also, when a student, read of there being used on some engineering work. I think it was during the improvement of the Thannon over thirty years ago. The principle is that you can see plainly to a great depth in water, especially if the bottom of the sea or river is of a light colour, if the surface is perfectly smooth. On a perfectly calm day, when the surface of the sea was like a mirror, I have seen scallops netted at Port Magee, Valencia, in from three to four fathoms of water, and on other occasions, on the west coast I have plainly studied the bottom of the sea to a far greater depth, while fishermen have told me that on such calm days they have seen the bottom in over forty or fifty fathoms. Such calm days are of rare occurrence, and if there is the least ripple on the surface you cannot see into the water. The use of the telescope, therefore, is to get below the disturbed surface into solid water. I made a water-telescope that I found very effective. It was a tin map case, about three inches in diameter, and about three and a half feet long. I took off the top and knocked out the bottom, and looked through the tube when the end was about a foot, or a foot and a half below the surface. I had no glass in it, but a glass might be an advantage, as it would keep a column of air in the tube, and thus prevent the water oscillating in it. I would like to know to what depth the Norwegian fishermen can see. The water in their fiords is very clear, like the water off the west coast of Ireland, into which you can see, for much greater depths than into the water off the east coast. In fact, when the tide is on "flow" in the Irish Sea it is rarely possible that you can see down into it anywhere within half a mile of the coast, as the "tidal current" and the usual "ground swell" keep it dirty. On this account I am afraid the telescope might not be as effective as it ought to be in the localities mentioned by Dr. Buckland.

THE French Government has cut off the usual allowance of 8,000 f. or 10,000f. to the Reformed Church of France for the formation of new parishes. The Chambers will be asked to renew the grant.

The Sound of Thunder.

The next remarkable feature of the storm is the thunder, corresponding, of course, on the large scale, to the snap of an electric spark. Here we are on comparatively sure ground, for sound is much more thoroughly understood than is electricity. We speak habitually and without exaggeratiou of the *crash* of thunder, the *rolling* of thunder, and of a *peal* of thunder; and various other terms will suggest themselves to you as being aptly employed in different cases. All of these are easily explained by known properties of sound. The origin of the sound is, in all cases, to be be looked for in the instantaneous and violent dilatation of the air along the track of the lightning-flash, partly, no doubt, due to the disruptive effects of electricity of which I have already spoken, but mainly due to the excessive rise of temperature which renders the air for a moment so brilliantly incandescent. There is thus an extremely sudden compression of the air all round the track of the spark, and a less sudden, but still rapid, rush of the air into the partial vacuum which it produces. Thus the sound-wave produced must at first be of the nature of a bore or breaker. But as such a state of motion is unstable, after proceeding a moderate distance the sound becomes analogous to other loud but less violent sounds, such as those of the discharge of guns. Were there few clouds, were the air of nearly universal density, and the flash a short one, this would completely describe the phenomenon, and we should have a thunder *crash* or thunder *clap*, according to the greater or less proximity of the seat of discharge. But, as has long been well known, not merely clouds but surfaces of separation of masses of air of different density, such as constantly occur in thunder storms, *reflect* vibrations in the air; and thus we may have many successive echoes, prolonging the original sound. But there is another cause, often more efficient than these. When the flash is a long one, all its parts being nearly equidistant from the observer, he hears the sound from all these parts simultaneously; but if its parts be at very different distances from him, he hears successively the sounds from portions further and further distant from him. If the flash be much zig-zagged, long portions of its course may run at one and the same distance from him, and the sounds from these arrive simultaneously at his ear. Thus we have no difficulty in accounting for the rolling and pealing of thunder. It is, in fact, a mere consequence, sometimes of the reflection of sound, sometimes of the finite velocity with which it is promulgated. The usual rough estimate of five seconds to a mile is near enough to the truth for all ordinary calculation of the distance of a flash from the observer. The extreme distance at which thunder is heard is not great, when we consider the frequent great intensity of the sound. No trustworthy observation gives in general more than about 9 or 10 miles, though there are cases in which it is possible that it may have been heard 14 miles off. But the discharge of a single cannon is often heard at 50 mile, and the noise of a siege or naval engagement has certainly been heard at a distance of much more than a hundred miles. There are two reasons for this: the first depends upon the extreme suddenness of the production of thunder; the second, and perhaps the most effective, on the excessive variations of density in the atmosphere, which are invariably associated with a thunder-storm. In certain cases thunder has been propagated, for moderate distances from its apparent source, with a velocity far exceeding that of ordinary sounds. This used to be attributed to the extreme suddenness of its production; but it is not easy, if we adopt this hypothesis, to see why it should not occur in all cases. Sir W. Thomson has supplied a very different explanation, which requires no unusual velocity of sound, because it asserts the production of the sound simultaneously at all parts of the air between the ground and the cloud from which the lightning is discharged.

MR. MACKAY, the Bonanza millionaire, is said to have become morose and suspicious, so many adventurers and impostors having practiced on him that he has lost faith in human nature.

IT makes a mother's heart revert to her younger days when she comes into the parlour next morning after her daughter's beau has been round, and finds only one chair in front of the fireplace and the others sitting along the wall as if they hadn't been touched for three years.

Big Farms on the Pacific Coast.

The "Mammoth Farm," of the Blacklock Wheat Growing Company of Washington Territory, comprises 60,000 acres of wheat land, of which 25,000 acres are fenced. Ground has been broken for a crop which is expected to foot up between 300,000 and 400,000 bushels.

Another large farm is that of Dr. Hugh J. Glenn, of California. It is in the Sacramento Valley, and comprises 65,000 acres, of which 45,000 acres were in wheat this year. The owner had provided 350,000 sacks, each holding 140 pounds, but at last reports they promised to be unequal to the task of holding the crop. Dr. Glenn has his own machine shops, blacksmith shop, saw and planing mills, etc. He manufactures his own waggons, separators, headers, harrows, and nearly all the machinery and implements used. He has employed 50 men in seeding and 150 in harvest, 200 head of horses and mules, 55 grain headers and other waggons, 150 sets of harness, 12 twelve-foot headers, 5 sulky hay rakes, 12 eight-mule cultivators, 4 Gem seed sowers, 8 Buckeye drills, 8 mowers, 1 forty-eight inch separator, 36 feet long and 13½ feet high, with a capacity of 10 bushels per minute; 1 forty-inch separator, 36 feet long; 2 forty-feet elevators for self-feeder, 1 steam barley or feed mill, and 2 twenty horse power engines. The forty-eight inch separator thrashed, on the 8th of August, 1879, 5,779 bushels of wheat.

Hysteria.

Hysteria is by no means confined to women, for one of the worst attacks which I have witnessed occurred in a man. This gentleman one day found he had lost his all, and on returning home, he became the victim of laughing and crying, until sheer exhaustion brought an end to the attack. This was quite involuntary. But it might be remarked that even in hysteria such a thing as fashion prevails, showing that a certain power of restraint may be used. When I was a boy, hysteria was the fashion; and if during conversation any remark was made to touch a lady's sensibilities, she would clinch her hands, make a wry face, her eyelids would undergo a rapid vibration, she would give a sob or two, and sink from her chair. The cure was accomplished by throwing cold water over her face; and if this encroached on her neck or wetted her dress, the cure was very sudden and complete. During church service, it was the usual practice to have a young lady carried out; but I think as a rule she belonged to an inferior class, whose kind of work during the week did not allow them to play dress-making tricks with themselves on a Sunday; for if I remember rightly the cure was effected in their case by the call for a pen-knife. This was used to loosen the body-armor, when a loud explosion took place, followed by a deep sigh and a speedy recovery of the patient. So fashionable was fainting or hysterics in church, that I have a lively remembrance of a young lady who had a weekly attack, and was often carried out by a gentleman in the next pew. As these two were afterward married, I apprehend that this was one mode of courtship. I am only too thankful to think, for the peace of other people, that this method of forcing matrimony has gone out.

Disappearance of a Railway Train.

For a railway train to be lost, to entirely disappear, would seem to be almost impossible, yet this curious casualty has actually happened in the United States to the Kansas Pacific Railway, which has spent $2500 in searching for the runaway, and has at last given it up in despair. About 100 miles west of Kansas city, the line runs through a place called Monatony, which was visited some time ago by a terrible storm and waterspout, over 600 feet of track having been washed away. The adjacent neighbourhood, which consisted of huge rolling prairie, was eight feet under water, and it is conjectured that the locomotive waggons (it luckily not being a passenger train) were carried away and buried under a landslip. This is the second time of such an occurrence, an engine having been lost in a quicksand at Kiown Creek in 1818.

"How musically his hoof-beats sound!" exclaimed an enthusiastic lover of the turf, as St. Julien speeded around the course at Brighton last week. "Yes," replied his matter-of-fact companion; "he is beating time.'

A New Oil Monopoly.

A very powerful combination of western capitalists has obtained control of the oil producing country of California discovered up to the present time, which consists of a section of ths Coast Range mountains, five hundred and fifty miles in length, stretching from Santa Cruz to Santa Barbara and two hundred thousand acres. For four years the work of examining the region by experts has been going on and is now completed, and every spot giving indication of oil has been secured. Part of the region was government lands and part of it has been leased for twenty years from farmers and ranch owners who had obtained possession. During the last twelve years three parts of the oil-bearing region have been partly developed by various men, and the present monopoly is the result of successful combination of the original owners, who finally sold their interests to the three leading men : C. N. Felton, ex-Assistant United States Treasurer, and one of California's large capitalists ; Lloyd Tevis the president of Wells, Fargo & Co. Express and Bank, and D. G. Scofield. They have formed the Pacific Coast Oil Company, and under its control the California oil country promises to be one of the great important oilproducing regions of the world. During the last six months rapid strides have been made in developing the region. Wells have been sunk which show excellent results, machinery bought, works and refineries constructed, pipe lines laid, barrel and cask factories built, and with unlimited capital enormous negotiations are effected for the equipment in every respect of a gigantic business enterprise, which is probably destined to exert a strong influence upon the Pennsylvania district, and upon all existing oil markets.

A short time ago Messrs. Felton, Tevis, and Scofield bought the entire stock of the company, and now have sole control of the business. About twenty one "rigs" for drilling are now in process of construction, and the development of the country will be pushed as quickly as money can push it. The last well which has been drilled was a fifty barrel pumping well in the Santa Cruz district. which was struck last week. The company now has sixteen wells down in the region which yield three hundred barrels daily, and new wells are begun nearly every day. The average per centum of lubricating oil gained from the crude is seventy-five per centum, which is a large average. The home market at the present time absorbs all the oil that the country can produce, but the amount produced will soon run beyond the capacity of the home market, which includes California, Nevada, and Oregon.

Touching the markets which the Pacific Company claims for their oil, a few facts will suggest the condition under which these men enter into competition, with eastern oil producers in the United States. California, Oregon, and Nevada together consume 3,500,000 gallons yearly. Japan, which is from five to six months sail "around the horn" from New York, and thirty-five days' sail from San Francisco, consumes 15,000,000 gallons a year, China, which is fifty days' sail from San Francisco, and Japan consumes 5,000,000 gallons a year ; Jaya, sixty days from San Francisco, and five or six months from New York, consumes 5,000,000 gallons a year, and Mexico, Australia, and the Sandwich Islands, each large consumers, are also advantageously situated for the California trade.

Last year the production of the Pennsylvania region was nearly 20,000,000 barrels. Nearly all the oil sent to China, and Japan from this part of the United States, is carried by ship around the Horn and the Cape of Good Hope. The shorter voyage from California is an immense advantage to the new monopoly.

Fasting Horses.

To determine the capacity of horses to undergo the privations incident to a state of siege, a series of experiments were made with these animals in Paris, some years ago. The experiments proved (1) that a horse can hold out for twenty-five days without any solid nourishment, provided it is supplied with sufficient and good drinking water. (2) A horse can barely hold out for five days without water. (3) If a horse is well fed for ten days, but insufficiently provided with water throughout the same period, it will not outlive the eleventh day. One horse, from which water had been entirely withheld for three days, drank on the fourth day sixty litres of water within three minutes. A horse which received no solid nourishment for twelve days was nevertheless in a condition, on the twelfth day of its fast, to draw a load of 279 kilos.

USEFUL RECEIPTS.

The skin of a boiled egg is the most efficacious remedy that can be applied to a boil. Peel it carefully, wet and apply it to the part affected. It will draw off the matter, and relieve the soreness in a few hours.

To Clarify Fat.—Cut into small pieces, fat of either beef or mutton. Put into a saucepan and cover the pieces with cold water. Still until the water boils, skim carefully and allow to boil until the water has all been discharged in vapour—the fat will then be of the colour of salad oil—strain and it will keep any length of time.

Apple Batter Pudding.—Four beaten eggs, one pint of rich milk, two cups of flour, one teaspoonful of salt, two even teaspoonfuls of baking powder. Peel and core eight ripe, tart apples ; put into a deep, baking-dish ; fill the centre of each with sugar and pour the beaten batter over them. Bake an hour and eat with cream and sugar, flavoured with nutmeg or melon.

Good Apple Butter.—Boil a kettleful of new cider until reduced two-thirds. Have a quantity of tart, juicy apples pared, cored and sliced, and put as many into the kettle as the cider will cover. Cook slowly until tender, skim out and put in a second supply of apples. When tender turn all out and let stand over-night. In the morning return to the kettle and boil down until quite thick. Add whatever spice you please. It requires almost constant stirring,

Quince Preserves.—Pare, quarter, and core, saving the skins and core. Just cover the quarters of quince with cold water and simmer until tender. Take out the pieces carefully, and lay on flat plates. Add the parings, etc., to the water cover tightly and stew an hour. Strain through a jelly-bag and to each pint of the juice add a pound of granulated sugar. Boil, skim, add the pieces of quince and boil gently 10 minutes. Turn out and let stand over-night. In the morning skim out the pieces, boil up the syrup, put in the pieces, simmer 10 minutes, take out on to flat dishes and set in the sun, Let the syrup boil until it begins to jelly, then fill the glass cans two-thirds full of the fruit and cover with the syrup.

To Roast a Turkey.—Make a stuffing of bread crumbs, pepper, salt, and a little piece of butter ; mix it lightly with an egg. Stuff the craw, Split it, and lay it down a good distance from the fire, which should be clear and brisk. Dust it with flour, and baste it with cold lard several times. When done, serve it with its own gravy. Be sure to skim the oil from the top of the gravy before serving it in the boat proper for its appearance at table. If it be of a middle size, that is to say, seven or eight pounds in weight, an hour and a quarter should be allowed for roasting. The same directions answer for baking in a stove, only the process is slower, and will require from two to three hours, according to the tenderness of the flesh. If by any accident a turkey has been allowed to get stale or in the least tainted, wash it thoroughly in vinegar and water, in which a tablespoonful of bicarbonate of soda has been dissolved. It will remove all unpleasant taste and odour, and render the flesh more tender.

A Singular Privilege,

Lord Kingsale and Lord Forster both enjoy the singular privilege of standing covered in the presence of royalty. Lord Forster obtained this concession from Henry VIII., but the right belonging to Lord Kingsale dates from the reign of King John. It originated thus :—His ancestor, the Earl of Ulster had a very strong arm, and one day, at the desire of the King, he chopped a massive helmet in twain in presence of the French Sovereign, King John was so pleased at the feat that he desired him to ask at his hands any favour that he pleased, and the Earl replied that, as he had estates and wealth enough, he would only ask for himself the singular privilege referred to. It is related that on one occasion at a drawing-room George III. rather nettled at the length of time the hat was kept on, remarked, that although he had no wish to call in question Lord Kingsale's right to wear it in his presence, still his lordship might have remembered that there was a lady (the Queen) in the room.

A telephone operator, when asked to say grace at a dinner, the other day, horrified party, in a fit of absent-mindedness, by bowing his head and shouting, "Hello! hello?" Force of habit.

A Farmer's Creed.

At a recent farmer's convention held in Providence, the following creed was adopted :

"We believe in small farms and through ultivation ; we believe that the soil lives to eat, as well as the owner, and ought, therefore, to be well manured ; we believe in going to the bottom of this, and therefore deep ploughing, and enough of it ; all the better if it be a subsoil plough ; we believe in large crops, which leaves the land better than they found it, making both the farm and farmer rich at once ; we believe that every farm should have a good farmer ; we believe the fertilizer of any soil is a spirit of industry, enterprise, and intelligence ; without these, lime, gypsum, and guano would be of little use ; we believe in good fences, good farmhouses, good orchards, and good children enough to gather the fruit ; we believe in a clean kitchen, a neat wife in it, a clean cupboard, a clean dairy, and a clean conscience ; we believe that to ask a man's advice is not stooping, but of much benefit ; we believe that to keep a place for everything and everything in its place, saves many a step, and is pretty sure to lead to good tools and to keepin them ing good order ; we believe that kindness to stock, like good shelter, is saving of fodder ; we believe that it is a good thing to keep an eye on experiments and note all, good and bad ; we believe that it is a good rule to sell grain when it is ready ; we believe in producing the best butter and cheese, and marketing it when it is ready."

Salt for Sheep.—It is said that in Spain whenever sheep are kept in the neighbourhood of rock salt hills or sea salt and have access to it, they thrive better than in other situations, and in France the same thing is found to exist in the neighbourhood of the sea coasts and the salt works of the north, sheep give more and better wool, and the mutton is more highly esteemed than that from other localities. Where it is given to them when at pasture, the amount should be from half an ounce to an ounce each, daily ; and it is a well-known fact that sheep never stray from an enclosure in which salt and water are provided for them.

Saddle Horses.

At the present moment there is a great market in England for almost every variety of agricultural produce, but prices for the general run of such animals as are exported, though satisfactory to the common graziers and stock farmers, are not high enough to tempt men of capital to breed, raise and prepare them for market.

Raising trotting and other horses does not remunerate very highly, because so few become fast enough to sell for the best prices, and as trotting is an unnatural pace to race in, a great deal of expense is necessary to keep and pay trotting men to handle the colts. Breeding race horses is no better, on account of the tendency among thoroughbreds to grow light and weedy, so that, should they fail in being fleeter than the average, there is no demand for them.

Now, as the best saddle horses in England are always in demand, and those of extra merit sell for very large sums, any gentleman who would go intelligently to work in selecting dams of powerful frames, and using a stallion of the most fashionable blood, might secure an income of many thousands per annum by such management as would bring out from 10 to 20 young horses just fit for riding in the chase, and the thousands might be tens of thousands if with proper breeding and management, these young horses were large and strong enough to carry gentlemen of heavy weight up to the hounds.

The art of successful stock farming consists in producing such animals as will sell for great prices, without being obliged to expend heavily in preparing them, and these animals can be brought out fit for sale without any expensive training.

Saddle horses commanding prices equal to those of the best trotters here, will require no breaking to harness, for it would be a serious drawback to a valuable hunter to have been used in any way in harness.

"Who are these Pan-Presbyterians that have been having a convention?" asked Mr. Slogoer of his friend Jolliboy. "That's what I want to know myself," said Jolliboy. "I never heard of them till now. I suspect, though, it's only another name for the orthodox fellows who stick to the belief in eternal punishment. They probably call themselves Pan-Presbyterians because whoever leaves them jumps out of the frying-pan into the fire."

Cider Vinegar.

The enormous supply of apples all over the country suggests the idea that a good part of them may be turned into cider vinegar with profit. Vinegar may be made directly from the apples, but it is much preferable to first extract the cider.

When cider is intended for vinegar it should be made with the same cleanliness as if intended for drinking or keeping, and the casks into which it is put for fermentation, should be equally sweet, and if old whisky casks are used, it improves the cider as well for vinegar as for drink.

There should be nothing added to the juice, as pure juice is best ; the mustard seed, sulphite of lime, and other such ingredients used for stopping fermentation, injure the vinegar. The better the apples, the better the vinegar, and cider made late in the autumn from fruit rich in juices, is much better than that from windfalls and early-gathered fruit, as cider is better for the same reasons.

Vinegar may be made from crushed apples, or from the pomace after the cider is pressed out, as is often done from the pomace of grapes and of other fruits. The apples are ground and put into shallow holders where they are left to ferment for a couple of days, then pressed and the juice put directly into old vinegar casks containing mother of vinegar. If the weather is cool the casks are placed where they will be kept warm, and in a few months the vinegar may be drawn off into clean vessels. The chief auxiliary to producing vinegar quickly is exposing the fluid to the air at a mild temperature, but for the best cider vinegar, where haste is not necessary, it is better to extract and barrel the cider, allowing it to ferment as in the best process of cider making, and then using the cider as desired. Most cider vinegar, and perhaps the best, is made by leaving the bung open and allowing the change to take place gradually, which will be in a longer or shorter time as the temperature is warmer or cooler.

Numerous methods are in practice by large manufacturers who purchase large quantities of cider and expose it to the air in large vats in various ways. One process is to allow the cider to run slowly over beech shavings ; another allows it to trickle down over boards or shelves, while still another process is to force bubbles of air through the liquor continuously.

A French method consists in scalding the barrels with water and then pouring boiling vinegar into them and rolling them until the barrels are thoroughly saturated, when the barrels are filled about one-third full of cider vinegar, and some two gallons of cider poured in each seventh or eight day until the casks are two-thirds full. In two weeks from the time of adding the last two gallons, one-half is drawn off and the process repeated. The casks are kept as near a temperature of 80 degrees as possible.

This last process gives farmers a hint for producing cider as may be desired, by keeping the barrel in a warm place and adding cider to the vinegar barrel, or by putting a quantity of sharp vinegar into the cider.

The cores and parings left from drying apples may be used as above described, or they may be placed in jars or tubs, and warm water poured over them, and set in the sun or other warm place for a week or ten days and the juice added to the vinegar barrel, or used with the addition of cider. The principle of vinegar making is fermentation, and this comes from the presence of sugar, and may be hastened by yeast or similar aids, but the best agent to produce fermentation is strong old vinegar. The richer the juice in saccharine matter the stronger the vinegar, and the warmer the temperature and the more the vinegar is exposed to the air the more rapid the process.

The Roman Catholic bishop of B—— is a most energetic cleric. He performs as much parish duty, I believe, as most priests. He received the other day the confession of a little boy. At the close said his right reverence : "Well, have you anything more to tell me?" "No," said the lad, deprecatingly, "but I'll have more next time!"

The other day a census-taker presents himself at a house where all is in confusion and several women are running to and fro with pieces of red flannel, camphor, and the like. "Have you any children," says the employee to the agitated head of the household. "I have two," replies the latter, "and—as it will save you the trouble of calling round again—if you will have the goodness to take a seat for a moment, I will have three—at least three."

MARKET REPORTS.

CANADA LUMBERMAN OFFICE,
TORONTO, 28th Oct., 1880.

The stock of lumber on hand is small, and the demand for export continues in advance of the transport facilities afforded by the Northern Railway, which is practically the only route which feeds this market. Large quantities are on hand along the railway line waiting shipment. There is a brisk demand for vessels for United States ports. Rates to Oswego, stiff at $1.50; but within ten days or two weeks the stock for that market will be about all shipped. There will probably then be a lull in the trade as local market is dull and will likely continue so. The docks in Oswego are full of lumber The demand there is good, and while no great advance of price is looked for, the business is expected to continue healthy until spring, when if the anticipated large supplies are taken out this winter a decline will likely take place in prices. Building operations are brisk, and a good many buildings are expected to be put up next spring. Carpenters wages range from $1.25 per day.

CHICAGO.

The Chicago market was exceedingly dull—week ending Oct 23, but slightly revived on account of the non-arrival of some 20 or 25 cargoes of lumber, wrecked in the storms which raged recently on the Upper Lakes.

PIM'S

ROYAL PRINTOGRAPH

THE KING COPYING TABLET.

Always takes the lead.

Over 400 copies have been printed from one writing.

PRIZES AWARDED FOR SUPERIOR MERIT

The only Diploma given by the Industrial Exhibition Association of Toronto, for "Copying Tablets," was awarded to us for our "Improved Copying Tablets," with black and coloured inks.

We also received a Special Prize at the Provincial Exhibition at Hamilton, and also an Extra Prize for our very "Superior Copying Inks," for use on the Printograph or other Copying Tablets.

GREAT IMPROVEMENTS,
NEW FEATURES
BLACK AND COLOURED INKS,
AND A
SPECIAL PENCIL.

Also a Special Copying Ink for use on Rubber-Stamps.

EVERY PRINTOGRAPH IS WARRANTED.

PRICES REDUCED

Printographs. $1.00 and upwards, according to size. Inks, 25 cents per bottle. Copying Pencil, 20 cents each. Our manufactures can be sent to any address on receipt of price.

PIM & CO.,

Manufacturers, 61 King Street East, Toronto.

CAUTION—As there are worthless imitations being sold under different names the public are cautioned against buying any but "Pim's Royal Printograph," as none but those bearing our name are genuine.

GLASS BALL CASTORS

For FURNITURE, PIANOS, ORGANS, etc., the best and most ornamental Castors in the market. They greatly improve the tone of musical instruments.

RHEUMATISM, NERVOUSNESS, SLEEPLESSNESS cured by insulating beds with them.

Sold by hardware dealers. Agents wanted.

ADDRESS FOR CIRCULARS :

GLASS BALL CASTOR COMP'Y,

ST. JOHN, N. B.

E. COSMAN, - - Proprietor.

Terms, $1.00 to $1.50 per day.

THE RUSSELL HOUSE,

OTTAWA,

JAS. A. GOUIN, - - Proprietor.

IS THE

Favourite Resort of the Leading Public men of the Dominion attending the annual Sessions of Parliament.

Ministers of the Crown, Senators, Members of Parliament, Public Officials, as well as those having business with the various Departments of the Government. It is also the head-quarters of those having dealings with the princely Lumber Manufacturers in the great Pine Valley, of which Ottawa is the acknowledged centre.

THE RUSSELL HOUSE being central, almost abutting on the magnificent PARLIAMENT and DEPARTMENTAL BUILDINGS—the pride of the Country—is thus conveniently situated for those visiting the City on public business. But the location is also everything that could be desired alike for the man of business and the man of pleasure. A few minutes walk brings the guest of the Hotel within reach, not only of all the principal business resorts, but also of the most splendid Mountain and Valley Scenery that can be seen anywhere, as also of the two almost unrivalled Waterfalls—the Chaudiere and Rideau—and of the extensive Manufacturing Establishments and Depots of the leading Lumbermen. But, besides the beautiful scenery, which, it may be mentioned, includes the magnificent Ottawa and two of its grand tributaries—the Rideau and the Gatineau—there are in the immediate neighborhood, beautiful Lakes and apparently never-ending woods, which afford opportunities for the finest Fishing and Shooting that can be obtained on the Continent.

THE RUSSELL HOUSE affords excellent accomodation for 300 guests; its table is abundantly supplied with Viands of the choicest description, in season, and nothing is left undone to make every visitor feel comfortably "at home."

☞ **Omnibusses meet the Arrival of every Train and Boat.**

*In examining the table it must be borne in mind that it relates only to business done in Canada. This comprises the *whole* of the business done by the local companies, but only the Canadian business of the British and American Companies. The Ætna's total income was **$4,350,897.30** in 1879.

☞ Of the $131,883 of "Policies become claims" in the case of the ÆTNA LIFE, **$53,764** was by the maturity of Endowment Policies—*i.e.*, policies payable at death or the end of 10, 15 or 20 years if living. In the other 19 companies, all combined, only a total of $24,943 of this excellent kind of insurance was paid in 1879.

$36,000 was added by the ÆTNA LIFE, the past year, to its Government Deposit, making it the largest of any Company, and nearly 4 times that of most Canadian Companies.

☞ The superior standing of the ÆTNA LIFE is shewn by its total income being **$4,350,897.30**, and by its Canada Branch income being nearly equal to the combined premium income of the whole 9 British Companies, or that of the 3 lesser American Companies, or that of all the Canadian Companies but one. This one has been 32 years getting $536,293, while the Ætna's $307,847 has grown from less than $1000 in the past 14 years.

Interesting Trial of the 100-Ton Gun.

On Monday afternoon the 100-tun gun and the model *emplacement* in which it is mounted at the proof butts in the Government marshes adjoining the Royal Arsenal, Woolwich, where the objects of experiment, and the novelty as well as the importance of the occasion created considerable interest, as was manifested by the large number of officers and other visitors present. It was explained that the four 100-ton guns purchased of Sir William Armstrong some two years since are to be mounted on the defences of Malta and Gibralter, and that as it has been considered desirable to load them by hydraulic machinary, this experiment had been proposed in the hope of gaining some experience before proceeding extensively in permanent preparations. Elevated as the gun was, and pointed over the glacis of the parapet, it presented a most commanding aspect, and has probably never appeared to such advantage. More than 34 feet long, with the diameter at the breech of 6 feet 6 inches, tapering gradually off to 2 feet 6 inches at the muzzle, it had a more slender and less sturdy outline than that of the natural system of heavy ordnance, but its admirers praised it as the combination of strength and elegance, and claimed for it the advantages due to the saving of weight and metal. Size and weight appeared of no consideration at all when a lever was touched, and the bulky breach rose and fell as the muzzle was elevated or depressed with no more apparent effort than a 9-pounder requires at the hand of a gunner; and the admirable adjustment of the machinery when the whole mass swept grandly round to the opposite point of the compass was unanimously confessed. Then the order was given to load. A small elongated carriage or cradle stood on a miniature railway close at hand, and upon this were placed two cartridges and the shot. The charge was 425 lbs. of pebble powder, and it was made up into two cartridges for convenience of carriage; but a tube ran through both and just at the point of communication a small primer of small grain powder had been inserted for the purpose of igniting the charge in the centre. The projectile was a huge bolt 17¾ inches in diameter, and nearly 3 feet long, its weight being, with the gas check attached, 2,020 lbs., or nearly a ton. The cradle with its burden ran along the rails, and entered an iron turret about 12 feet in breadth. One side was an open fort, to which the muzzle of the gun on the outside descended. On a turn-table in the centre of the apartment the cradle revolved bringing the charge close up to the muzzle of the gun, when out from the other side rose the head of the rammer and drove cartridges and shot into the mouth, and rammed them well home. The rammer, which was a 6-inch piston 54 feet in length, is moved by hydraulic rams with a 4-feet stroke and multiplying gear, and it descends through a tube into the earth. The monster gun, as soon as it was loaded, was elevated clear of the parapet, and was trained about 15 degrees to the left, which brought it exactly opposite to one of the sand bags at the butts, the act of moving the gun at the same time automatically closing the iron door of the loading port, which is in like manner opened by the return motion. The gun is to be fired through the axial vent, and the electric wire is passed through an arrangement of copper discs which have been contrived with the long desired object of effectually closing the vent and saving the evil consequences which arise from the escape of powder gases. The spectators withdraw to a safe distance, and after an interval of suspense an appalling roar, which makes the earth vibrate, is heard and deadens the senses for a time, and the enormous gun is observed calmly sliding down from the recoil amid a cloud of smoke, dirt, and *debris*. The first anxiety was to examine the structure, and the inspection was perfectly satisfactory, for nothing whatever had suffered from the discharge, and the durability of concrete even for real fortifications had become a subject for consideration. In this work upwards of 3000 tons of concrete has been used, about half of which is below and half above the ground, the lower half being compounded of cement and Thames ballast, and the upper half of cement and furnace slag. The latter was prepared with great labour, owing to the difficulty of crushing the refuse metal, and it is believed that it would stand a fair cannonading as well as the famous Gozo coraline with which the Malteze works are constructed. The hydraulic lever at the Mediterranean ports will be furnished with an arrangement similar to that used in Monday's experiments an accumulation weighted up to 67 tons, with a 16-inch ram and an 8-feet stroke. This can be raised by a steam sapper, of traction engine, in one minute, or forty men can pump it up by hand in seven minutes. The one round fired on Monday, is but the first in a series of experiments of a similar character, and it will be some time before the gun leaves Woolwich for its final destination in one of the Mediterranean fortresses.—*Times.*

The Cabul Mint.

HOW AFGHAN MONEY IS MADE—ENGLISH RUPEES RECOINED.

[Cabul Letter to the London Times.]

Let me now describe the process through which the English rupees at present pass to bring them out from the Cabul mint in the shape of Cabulee rupees. In one of the rude sheds which I have described as, running round the court-yard, are two rows of small, round clay hearths, elevated an inch or two above the floor, and depressed, like a plate, in the middle. A pile of rupees—generally 300 is added to the furnace. The lead, in combination with the bone ashes, separates, as is well known, the alloy. This first protess converts the rupees into a dull, unsightly mass of silver, free, or nearly so, from alloy. The pure silver thus extracted is then carried to another shed, carefully weighed, and an amount of English rupees equal to its weight added to it. Rupees and silver are then melted together in a clay crucible, and the melted mixture is then ladled by hand into molds, which give it the shape of flattened bars about twelve inches long. These bars are then taken to a third shed, to be annealed by hammering, and given the form of slender, round rods. The next process is that of drawing these rods through a plate of iron, perforated with round holes, to give them a uniform circumference. This is done by means of a rude hand-wheel, after which the rods are cut by hammer and chisel into the lengths requisite to form the future rupee, each of which lengths is carefully weighed in a pair of scales. Any that are too heavy are handed to a workman whose business it is to slice off a fragment with his chisel; any that, on the contrary, are too light are handed to another workman, who notches the little cylinder by a blow on his chisel, and inserts the required fragment into the notch. The cylinders are next carried to a fifth shed, and, after gently heating, are hammered into small, round disks, which have a yellowish-white colour. To remove this colour and give them brightness they are next plunged into a caldron of boiling water, in which they are boiled for some time along with apricot fruit and salt. This process imparts brightness to the dull disks of silver, and they are then ready for the last process they have to go through, that of stamping. This is, perhaps, the most interesting part of the operation. Two operators sit facing one another, half naked, on the ground, with a little iron anvil between them. Into the face of the anvil is inserted a steel stamp, destined to give the impression which the under side of the rupee will bear. One operator places the little silver disks with great quickness and accuracy upon the stamp, and the other, who is armed with a heavy hammer in his right hand, and a steel stamp bearing the inscription destined for the upper side of the rupee in his left, with one heavy, well-delivered blow, impresses the device on the soft lump of silver. Lastly, each rupee thus stamped is again weighed, and deficiencies in weight made up by the same rude process.

Settling in England.

(From the Parisian.)

It is announced that the ex-Empress Eugenie has just bought the Farnborough Hill estate, in Hampshire, close to the borders of the county of Surrey, for £50,000. The estate was the property of the late Mr. Longman, the well-known publisher, and consists of about 257 acres, with a charmingly picturesque mansion, erected, by the late owner eighteen years ago. The ex-Empress will not go into possession of it until January, as Mrs. Longman, the widow, is very anxious to spend another Christmas there. A memorial chapel will be built to receive the bodies of the Emperor and the Prince Imperial. The lease of Camden Place expires in March next

An Oregon ranchman threw a lasso clumsily, and the noose fell around his own neck. Just then the horse unseated him, and, one end of the rope being fast to the saddle, he was choked to death.

You Have no Excuse.

Have you any excuse for suffering with Dyspepsia or Liver Complaint? Is there any reason why you should go on from day to day complaining with Sour Stomach, Sick Headache, Habitual Costiveness, palpitation of the Heart, Heart burn, Water-brash, Gnawing and burning pains at the pit of the Stomach, Yellow Skin, Coated tongue, and disagreeable taste in the mouth, Coming up of food after eating, Low Spirits, &c. No! It is positively your own fault if you do. Go to your Druggist———and get a bottle of Green's August Flower for 75 cents your cure is certain, but if you doubt this, get a Sample Bottle for 10 cents and try it. Two doses will relieve you.

"They all do it."—For beautifying the teeth and preserving, for sweetening and giving fragrance to the Breath use "Teaberry" the new Toilet gem delightfully cooling and refreshing.

Ask for Castorine machine oil, for sale by dealers generally.

The Great Triumph of the 19th century is the great medical climax Burdock Blood Bitters, cures all diseases of the blood, liver, and kidneys, nervous and general debility, and is the purest and best tonic in the world.

For reapers, mowers and threshing machines use Castorine machine oil.

Try Burdock Blood Bitters, the great system renovator, blood and liver syrup, acts on the bowels, liver and kidneys, and is a superb tonic.

Castorine machine oil wears longer than other oils, and is entirely free from gum.

Have you neard of the wonderful cures effected and benefits derived from the use of Edison's Electric Belts. If not, call on your druggist for pamphlet with testimonials. They are as food to the hungry, as water to growing plants, and as sunlight to nature.

Castorine machine oil is not affected by the heat, thus making it a very economical oil to use on farm implements.

Dr. Fowler's Extract of Wild Strawberry cures canker of the stomach and bowels, dysentery, cholera morbus and all summer complaints.

The Toronto Oil Co. are sole manufacturers of Castorine. Infringements will be prosecuted.

Have Courage.—You may suffer from scrofula or some foul humour, your liver may be congested, your lungs diseased, your kidneys deranged, your joints distorted with rheumatism, you may be almost a walking skeleton, yet despair not, Burdock Blood Bitters has cured others—it may cure you.

Collars and Cuffs, new styles, Kid Gloves, new shades, one and two-buttoned, Silk Handkerchiefs, new patterns, Silk Umbrellas, new and cheap, at Cooper's, 109 Yonge street, Toronto.

It Never Fails.—Dr. Fowler's Extract of Wild Strawberry is an unfailing remedy for all kinds of bowel complaint.

It is the testimony of all men who have tried it that, "Myrtle Navy" tobacco has the most delicious flavour of any tobacco in the market, and that it leaves none of the unpleasant effects in the mouth which most tobaccos do. The reason for this is the high and pure quality of the leaf, which is the finest known in Virginia, and the absence of all deleterious matter in the manufacture.

Reaper and mower manufacturers say Castorine is the best oil in the market.

The Greatest Popularity of Dr. Fowler's Extract of Wild Strawberry is where it has been longest known. Time cannot detract from its merits. It if the old reliable remedy for all bowel complaints incident to the summer season.

Burdock Healing Ointment, carbonated, should be used in connection with Burdock Blood Bitters for curing ulcers, abscesses, fever, sores, etc.

A Roman Holiday.

(Rom. Cor. N. Y. Sun,)

The tenth anniversary of the capture of Rome was celebrated here on the 20th of September with more than ordinary rejoicings by the ministry and municipality.

When the Italian Government decided to seize Rome in 1870, after the recall of the French troops, Signor Giovanni Lanza was the prime minister. In parliamentary debate it has leaked out that he was then fearful of taking such a step, but that, his judgment having been overruled by sundry influential advisers of the crown, he at length consented to order Gens. Cadorna and Sixio to advance on the city of the popes. The bombardment of one of the gates, Porta Pia, having placed the defenseless city at their mercy. Signor Lanza at once put in a claim to all the glory of taking Rome, and he has steadily and sturdily maintained this claim. Since that memorable year of 1870, Italy has been immersed in a constant political turmoil, one clique of governing politicians giving place to another in quick succession. There have been no less than half a dozen ministries, Lanza, Minghetti, Depretis (twice premier), and Cairoli (now in his second administration) in turn held sway. The most statesmanlike quality these ministers exhibited was to keep themselves and their favourites in power by a series of hand-to-mouth expedients. Lanza and Minghetti, belonging to the party of the right, claimed to rule from a conservative point of view ; Depretis and Cairoli, at the head of the party of the left, put themselves forward as the champions of the people. Although supported by popular opinion and indorsed by Garibaldi, the two last premiers proved, in some respects, to be more royalist than the king himself, especially in court matters. Their deference to the royal prerogative and etiquette, and their failure to institute any popular reforms, notably that of the enlargement of the suffrage, were abundantly satirized by both the right and the left. In reality, they followed in the footsteps of their predecessors in religious, military, and financial affairs. While these four men claimed to be carrying out Cavour's policy of unification and consolidation, Ratazzi and La Marmora, the two leaders, who, in conjunction with the famous Piedmontese statesman, did most to found the new kingdom, were thrust aside, and died, as is generally believed, broken-hearted.

The transfer of the government to Rome in 1871 was disastrous to Florence, which, during seven years, had been put to great expense in preparing to become a capital. Its trade and society dwindled until the authorities had to suspend payment because the municipality was bankrupt. Only two years ago it was even contemplated to place the "City of Flowers" in the hands of a receiver ; and though this was not done, because the national government promised a help which has been only partially afforded, the financial plight of Florence remains deplorable,—its debts unpaid, and its paper dishonoured. Turin, the original capital, had been somewhat similarly damaged when it ceased to be the seat of government ; but then Turin readily recuperated, because it was a wealthy commercial centre, which Florence never was.

Upon the instalment of the royal court in the Quirinal, and of the parliament in the wooden structure hastily erected at Monte Citorio, the celebrated guarantees to the pope which had been voted at Florence were promulgated officially. In substance these guarantees, while declaring the government supreme over the newly-captured city, left the pope in possession of the palace of the Vatican, as a great personage entitled to privileges, and allotted him a salary of $65,000 a year. This salary has never yet been paid, because neither Pius IX. nor Leo XIII. would take it, and the amount has only nominally figured in the national budget ; if called on to pay its accrued total the government would be sorely pressed. The law of guarantees, with the exception of paying this salary—and the series of laws passed in 1873, confiscating a portion of the church property and abolishing the religious orders and fraternities in Rome, have been rigorously executed. Much of the confiscated property was sold at auction at merely nominal figures to government favourites and intriguing speculators.

The ten years' interval since 1880 has wrought changes in the new capital. At first the Romans were disposed to be jubilant, as unusual privileges were showered upon them at a stroke of the pen, and as, under the settlement in the Corso and Via Condotti of a host of bustling merchants' trade had a brisk send-off. The population was dazzled, and looked for wonders. But the tinsel of first appearances soon wore off when it was found that the promised prosperity had feeble foundation. What had been the support of the city suddenly ceased. The wealthy foreign visitors, who had been accustomed to spend their winters between the Coliseum and the Vatican, failed to put in an appearance or to furnish the "ways and means." There has consequently been no little misery and grumbling among the citizens, reduced to live off the driblets vouchsafed by government employees and cheap tourists, travelling for the most part with small satchels instead of big trunks. Owing to the influx of settlers in the wake of government and court, the population amounted, according to the census taken on Dec. 31 of last year, to 301,680, showing an increase of 75.000 in the last decade. From the very commencement of the new era, rent, provisions, and clothes, and living in general grew dearer. Gold and silver vanished early, and are never seen now as in the days when the foreign world distributed so lavishly the precious metals. Trade and manufactures have not, so far, been built up extensively, except among a small minority of the citizens. The ruins have been excavated, restored, repaired ; new houses built ; entire quarters put up by a syndicate of speculating capitalists, old ones demolished or freshly washed, and new streets run, until the city's old picturesqueness has been seriously curtailed. From a modern point of view, of course, numerous improvements have been made. At the same time, as Rome was not built in one day, neither can it be pulled down in a day, and the modernizing process has not gone so far but that an abundance of the antique is left to maintain the city's reputation as the richest of curiosity shops. The municipality has been chiefly at the expense of constructing new streets—foremost among which is the Via Naziona's—and in establishing public free schools, which are now more numerous and better managed than those of any other Italian city. The pupils learn with a remarkable aptness, and the younger generation of Romans, unlike their fathers and mothers, will start in life with a fair amount of elementary knowledge. The children of the nobility and upper classes of Roman society are still invariably educated in the Roman Catholic schools.

A decade with Rome as capital has rendered a change very perceptible in Italian society at large. It has, above all, become far more practical and less impressionable than in the ante-revolutionary war. Uniformity of aims and methods has already levelled those individualisms which were formerly established landmarks in town and country. Even the peasantry have joined in the modern chase after comfort, and, no longer content to vegetate in their poverty-stricken districts, are emigrating in swarms to both Americas in search of fortunes. Not so much to the density of population in the kingdom, numbering now twenty-seven millions of inhabitants, is this emigration due, as to the awakening of a new spirit which has rendered the old starvation unpalatable.

But the completion of Italy's long-coveted unity has within the last ten years doubled its debt. Its currency of paper money is at a discount of 15 per cent. ; taxes and deficits are yearly on the increase. The finances have been wretchedly mismanaged since Cavour's death, the expenses being many times over what they should have been. The excuse has been wars, great armies, and works of internal improvement, such as the Mont Cenis and Gothard tunnels, docks, ports, ships, and railroads. In constructing them the Italian legislators and financiers acted as if several Californians were under their thumb, and, indeed, as if no bills were ultimately to be presented for payment. An army and navy, increased out of all proportion to the requirements of the nation, continue to drain the national exchequer, and no prospect of stopping this drain is seen to glimmer even faintly on the horizon. Withal it is amusing to see with what levity the ministerial organs at Rome touch upon the national indebtedness. "Baron Rothschild, of Paris," said one of them, lately, "spoke very encouragingly of our finances." He must have spoken, then, with a view to his own pocket, or to get possession of a portion of the country as collateral for the money the rulers borrowed from him and dissipated.

THE London, Sevenoaks, Tunbridge Wells and Brighton coach horses, eighty in number, were sold by Messrs. Tattersall, on Sept. 20, and realized $18,500.

THE ECONOMIST

Financial, Railway and Mining Journal.

BOSTON. PUBLISHED WEEKLY. NEW YORK.

$3.00 a Year. 10 Cents a Copy.

THE ECONOMIST IS DEVOTED exclusively to the Financial, Railway, and Mining Interests of the United States. It is the representative journal of its class in New England, and has, by its conservative and independent policy, established a reputation and circulation which give it a commanding influence in its section. It aims to advance and protect the legitimate mining industry, and to guard investors from imposition and consequent losses.

THE ECONOMIST presents special inducements to advertisers through which to reach the wealthy classes of New England. Its circulation among the Mining States and Territories is large and rapidly increasing.

Specimen copies free.

PROSPECTUS.

The CANADA LUMBERMAN is now introduced to its patrons, and so far has met with a favourable reception.

Before its publication a large number of lumber and timber merchants and mill owners in the Provinces of Ontario, Quebec New Brunswick, and Nova Scotia, and manufacturers whose line is to supply machinery for mills, saws, axes. files, oil, belting, sleighs, &c., were consulted in reference to the advisability of publishing such a journal.

Their opinion was that such a publication could be made highly useful to parties engaged in the various branches of trade above alluded to, as well as to those more directly interested in the mines and minerals of Canada.

Acting on their suggestions, THE CANADA LUMBERMAN has entered on this extensive and important field, with an adequate sense of the responsibility of the undertaking; and whilst craving leniency until fairly under way, we may repeat a portion of our introductory, viz: nothing shall be wanting on our part to make this journal a full and complete record of the lumber business, and all that relates to the trade in Canada. To this end the latest market reports, the contributions of trustworthy correspondents, trade circulars, etc., will be freely used, to give our readers the best, the earliest, and most reliable information that can be ascertained, concerning the important branch of business to which the journal will be especially devoted; while the mining, the milling, and the manufacturing interests will receive attention proportionate to their great claims on the public.

In short, it will be our endeavor to make THE LUMBERMAN worthy of its title in every respect; and, while giving special attention to the great staple industry to which it is devoted, it will also furnish a carefully selected amount of general reading that will make it a welcome visitor in every family.

Advertisers, especially those dealing in mill, mining, and lumbering supplies and machinery, will find THE LUMBERMAN a very favourable medium of reaching their customers, as it will circulate among these classes, and receive more attention from them than they have the time or inclination to bestow on a general newspaper.

The success of the LUMBERMAN must depend on the support it will receive from the classes above referred to; we trust, therefore, that they will overlook shortcomings at the commencement, and accord to the enterprise their generous and hearty support.

MORE TREES.

Scribner's Monthly says:—We do not remember any article in this department of the Monthly which has proved so prolific of beneficent results as one which was published four years ago, on "Village Improvement Societies." It was responded to from Maine to Texas, gave rise to a great deal of enquiry, and resulted in the establishment of a large number of associations for the beautifying and improvement of village property and life. One of the most important of all the improvements inaugurated was the setting out of trees for shade and beauty and profit; and this is so important a matter, from an economical point of view, that it deserves a special article. The appearance of Mr. B. G. Northrop's papers on "Tree-planting" and "Forestry in Europe" makes the writing of the article both easy and pleasant. Mr. Northrop has done a great service to the country in collecting and disseminating information upon these subjects, and we know of no man who has done, or is doing, so much as he to beautify and enrich the State which honours him with the charge of her educational interests. Such a man is a treasure to Connecticut, at any price, and he will not fail to be remembered, when the results of his foresight and enthusiasm shall become apparent and established, as a great public benefactor. More than fifty village improvement societies have been established in Connecticut, mostly through his agency, and he has gone up and down the State, making public addresses on the topic, until the public mind is fully awakened. We can do our readers no better service than in turning over the pages of information and statistics he has furnished, and quoting freely from them. In illustration of the great interest attached to forestry abroad, it is stated that, previous to 1842 there had appeared in Germany 1,815 volumes on the subject of forestry, and that an average of one hundred volumes on that subject are published in that country every year. There are more than 1,100 volumes on forestry in the Spanish language. In America, the great question has related to the best and quickest methods of getting our forests out of the way. We have done nothing but cut and burn our wood. Destruction has been the end aimed at, and the end has been only too well achieved. In the Old World, the effect of the destruction of forests has been very carefully and intelligently traced, and this effect should give America pause at once in her suicidal policy. To strip a vast realm of its trees is to change its climate from a soft and moist one to a dry and harsh one, to dry up its streams, with all their capacities for irrigation and navigation, and to transform a fertile soil into a barren waste. It is declared that Tunis and Algiers were once fertile regions, supporting a dense population. Their decadence is largely traceable to the destruction of the forests. Rentzsch ascribes the political decay of Spain to the same cause. Hon. George P. Marsh says: "There are parts of Asia Minor, of Northern Africa, of Greece, and even of Alpine Europe, where causes set in action by man have brought the face of the earth to a desolation as complete as that of the moon, and yet they are known to have been once covered with luxuriant woods, verdant pastures and fertile meadows." Mr. Marsh is trying to impress upon America the importance of arresting the work of destruction going on within her borders, and the facts which he adduces from Persia and the farther East may well excite our profound alarm. Regions larger than all Europe are now withdrawn from human use, though they once flowed with milk and honey.

In the discussion of this matter of the destruction of forests, we have never noticed any competent allusion to the agency of railways. Mr. Northrop tells us how many ties must be produced to furnish our 85,000 miles of railway, viz., 34,000,000 sleepers per annum. These are astonishing figures, but nobody talks of the consumption of wood for the production of steam-power in locomotives. Nearly all the railways of the country, passing through wooded districts, use wood for steaming just as long as the line will produce it. The consequence has been that a railway is a scourge to all the forests within five miles of it. The hills and valleys are stripped bare. A tornado ten miles wide, destroying everything in its path for the entire distance, would not be more disastrous to the forests than a railway throughout its length. Hundreds of thousands of acres of beautiful woodlands, that were the nursing homes of streams and the mothers of climatic salubrity and balm, have been burned up in the locomotive furnace, and the hills and valleys where the forests stood are baking in the sun.

A world of mischief has been done already in America, and now, of course, the question is, "What is the remedy?" The first answer is, "Stop destroying." Wood must be cut—that is true; but it is not necessary to cut it clean, unless the land is needed for cultivation. Timber must be felled for building and manufacturing purposes; but it is not necessary to denude the land and burn it over. Large tracts of undisturbed forests should be left, and then, when the work of destruction has been perfected, we must begin and plant forests and let them grow. The American is not a patient man. He is particularly desirous to see the result of his toils and his expenditures in his lifetime. To plant a forest, which it will take fifty or sixty years to mature, seems like that so good an investment for one's family cannot be made as an investment in the growth of a forest. Mr. Northrop quotes Dr. James Brown as saying that he has seen crops of larch, of sixty-five years' standing, sold for from $700 to $2,000 per acre, from land that was only worth originally from $2 to $4 an acre. It has been calculated by a competent authority that a plantation of ten acres of European larch, to last fifty years, will produce a profit of thirteen per cent. per annum, and give a net profit of $52,282,75! Mr. Sargent, director of the Botanic Garden and Arboretum of Harvard College, calculates that there are 200,000 acres of unimproved land in Massachusetts, which could at once be covered with larch plantations with advantage, and that, if so planted, their net yield in fifty years would be considerably more than a billion of dollars. Mr. Northrop advises the Connecticut farmers to plant white ash; but Grigor says: "No tree is so valuable as the larch in its fertilizing effects, arising from the richness of its foliage, which it sheds annually. The yearly deposit is very great, the leaves remain and are consumed upon the spot where they fall."

Farmers who want information for practical use should send to Mr. Northrop for his book. Lands are various, and have their special adaptations of certain kinds of trees. All trees, however, are trees of life, whose leaves are for the healing of the acres. If a farmer have a sterile pasture, let him remember that the way to make it fruitful at the least expense is to plant it with trees. Trees have a chemistry of their own for dissolving the elements of the rock in the crevices of which they will grow. Spread a throwing away life; but it is demonstrable sterile pasture with shade and strew it with leaves every year, and a good piece of land will be made of it for those who succeed the planter, while the crop of trees will pay all expenses and leave a handsome profit.

When we remember what a wonderfully beautiful object a tree is, how important a part it plays in all our landscapes, how useful it is in the arts and economies of life, and how beneficial it is in its climatic influences, we do not wonder at the enthusiasm with which specialists regard it, and the zeal with which such a man as Mr. Northrop pushes its claims upon the popular attention. If all communities would give themselves up to his leading, and share in his devotion, they would do a good thing for themselves and for the country. As for him we hope he will not become weary with popular indifference, and that, if necessary, he will be willing to wait as long as it takes a tree to grow for the reward which is sure to come to his memory.

THE light at the entrance to Byng Inlet, Georgian Bay, Muskoka District, Ontario, has been removed to a new building erected upon Gereaux Island, about half a mile N.E. ½ N. from its old position. The light is a fixed white catoptric, elevated 47 feet above water mark, and should be visible 12 miles from all points seaward.

A Benevolent "Old Salt."

On a certain winter's day, not many years since, an uncommonly cold northwestern blistered the Atlantic coast. Over toward the sand-dunes which protect a particular bay from the sea a man is fighting his way across the frozen surface in the face of the bitter gale. His objective is a house on the midland near the shore. The contrast between the luxurious warmth and coziness of the interior of this house and the cold desolation which prevails without would furnish ample material for the modern artistic "symphony" in color. After a hard struggle the man reaches the shore; under his arm flutters a paper parcel.

He enters the kitchen of this particular house, and with merely a nod to the cook seats himself in silence by the fire. He is perhaps sixty years of age—an ancient mariner whom many battles with the elements have rendered uncommonly reticent and uncommunicative. His head is bald, but an enormous tuft upon the chin makes amends for this deficiency, and adds to the grim solemnity of his appearance. At a recent revival, after fifty years' practical contemplation of life in various portions of the globe, he experienced religion. Friends and his dead wife's mother had hoped that under this soothing influence he might develop more genial methods of expression; but he was a man, as we have said, in whom experience had confirmed a natural reticence. When the moment arrived in which by some sign or word of mouth he was, before the assembled multitude, to show his ripeness for grace, a great silence fell on the congregation. With no change of countenance he arose in his place, faced to the northeast, the point from which he had always encountered the hardest gales, and roared out, as if addressing a man at the mast-head, "Look a here! I want religion, and I'm bound to have it!" This said, he dropped back into seat, silent, and grim. No change was observed in his deportment; he had satisfied the exigencies of the conventional village life. Under no influence could he be induced to alter or soften the angles of his brief but emphatic vocabulary. On the particularly cold day which I have mentioned he was moved by another sentiment, for snugly tucked in blankets on the upper floor of the house in which he was then seated, a newly born infant lay sleeping. From the mother, surrounded by every attainable luxury and comfort, this ancient mariner had once accepted a signal service, for which, up to this time, he had never given any sign of appreciative recognition. On this occasion for twenty minutes or more he sat by the fire grimly ruminating. Finally he started up, and taking from under his arm the package which he had thus jealously guarded during the entire session, he advanced and placed it on the table.

"Look a here," he said to the cook, "I understand Y——'s woman" (*Anglice* wife) "is hove to with a baby"—here he paused, and nodded assent to his own statement, in the direction of the northeast. "Look a here" (confidentially), "wimmin is mighty onsartain at them times, so I fetched this 'ere off the beach, a-thinkin' she might like suthin' sorter tasty." This said, he reseated himself in solemn silence by the fire. An examination of the "suthin' sorter tasty," which was enveloped in a thoroughly thumbed copy of the county paper, revealed a well-sanded salt mackerel—a waif washed on the beach from a recent wreck off the coast.

A Gambler's Method of Winning.

A German baron, who had been playing heavily at "makao," at the Pesth National Casino, and had, during a few months, won $40,000, was discovered cheating recently in a very curious way. He always appeared anxious to "take the bank," by which means he of course always dealt. He kept down the pile of bank-notes in front of him with a polished silver tobacco-box. He dealt over this, and could thus see the cards he dealt his players reflected in the lid of the box! A certain general of the staff observed this, and begged for the loan of the box to roll a cigarette. This request he frequently repeated, and observed that when the box was away the baron had variable luck like the others. The lucky gambler, a well-known racing man and of excellent family, is to be prosecuted as a common swindler.

LAST week a professional man addressed an Irish artisan, who was waiting in his hall, rather brusquely. "Halloa, you fellow, do you want me?" The answer was neat: "No, your honor, I am waiting for a gentleman."

ABOUT EMINENT PEOPLE.

NINA BOUCICAULT, the youngest daughter of Agnes Robertson, is said to be predestined for an irresistible soubrette actress. She is receiving her education to that end in France and Germany, is small in stature, small-featured, has a *nez retrousse*, and fine hazel eyes.

THE present voyage of the Prince of Wales's sons includes Madeira, Brazil, the Falklands, San Francisco, Vancouver's Island, the Sandwich Islands, China, and Japan. Their great--great--grandfather, George III., never even saw the sea until he was 50.

KING LUDWIG of Bavaria, who in council sits and makes his ministers stand, often wakes his old chamberlain at three o'clock in the morning to play billiards, and if he dares to yawn he is soon made to feel the weight of the royal displeasure.

MISS MINNIE HAUK has been spending her vacation in the south of France, Switzerland, and the Black Forest. She is now to sing through the principal Continental cities, after which she contemplates a season of concerts in London and the Provinces, as other English towns are styled.

MR. LONGMAN, the well known publisher of London has sold his estate at Farnborough Hill to the ex-Empress EUGENIE for $250,000. It consists of 257 acres and a picturesque mansion. The ex-Empress intends to build on the property a memorial chapel to receive the bodies of the ex-Emperor and the late Prince Imperial.

IT is related as characterizing the parties given by Lady Borthwick that at one of them there were present the Duke of Cambridge, the Princess Mary and the Duke of Teck, the Grand Duchess of Mecklenburg, the Crown Prince of Austria, Prince Ibrahim of Egypt, Midhat Pasha, Stanley and Cameron, the African travellers, and that at the same one Lady Waldegrave became acquainted with the Prince Imperial and Count Schouvaloff.

MR. CHILDERS, First Lord of the Admiralty in England, has been making his holiday tour in Ireland, accompanied by his family. There have been spontaneous demonstrations in all the towns through which he has passed in the west and south of Ireland, and innumerable addresses have been presented. Personally unknown in Ireland, Mr. Childers has received these compliments as the representative of Mr. Gladstone's Government

LORD VERNON, the father of Archbishop Vernon Harcourt, and great grandfather of Sir William Harcourt, was walking one day with a little boy, the son of his parkkeeper, in his park at Sudbury in Derbyshire, when a stag ran out from a herd of red deer, and desperately attacked him. Lord Vernon caught his assailant by the horns, and held him with great difficulty while the little boy, aged seven years, groped in his master's pocket for a penknife, with which, following Lord Vernon's instructions, he cut the stag's throat, dividing the jugular vein.

MR. RUSKIN will soon find himself unable to visit Venice, as well as America, for æsthetic reasons, as they propose to put steam-launches on the canals there. But he may be well content to stay at his beautiful home; it is called Brantwood, and is situated among the waters and mountains of the English lake country. His house is full of treasures, valuable manuscripts, among them that of Scott's *Peveril of the Peak*, ancient missals exquisitely ornamented, paintings by Titian and by Meissonier, Sir Joshua Reynold's Portrait of Angelica Kauffman, and a unique collection of Turners.

OFFENBACH had a taste for magnificence, and liked truth in the material order of things. It was his cherished ambition to found a theatre in which there would be no shams. After the war he realized his wish, and was ruined by it. La Gaite was his Abbotsford. Stage accessories in Gounod's "Jeanne d'Arc," "La Haine" of Sardou, and "Genevieve de Brabant" were what they professed to be. In a short time the manager had to liquidate and to sell his stage accessories at a loss of 87 per cent. He with difficulty met the demands of his creditors, and he would have been obliged to pass through the Bankruptcy Court if his wife had not placed in his hands a treasure she had hoarded unknown to any one. A very large number of persons believed he had the evil eye, the terrible *Jettattura* of the south of Italy. The well-known poet and critic, Theodore de Bannville, is said to have always carefully avoided mentioning the name of M. Offenbach in any of his articles for fear of evil consequences.

Pecuniary Independence.

We talk a great deal about our political, intellectual, moral, and social independence: all the world has heard us talk about them. We do not enjoy them as much, perhaps as we think. How much independence of thought has the journalist, for instance, who must bid for an audience, the author whose first thought must be never to displease a reader the orator who must repeat the stock notions of his hearers, the professor who has to reconcile evolution with theology; how much liberty of action has the voter who depends upon a government salary, or who is in a politician's employ? We can not very seriously blame these people, to whom independence often means starvation. What I want to set in clear light is this: that independence in life and thought depends, more than we like to believe, upon pecuniary independence; it is not to be had by wishing merely. Individuals there are, and always will be, who will suffer for their moral or intellectual independence; but communities will be what circumstances make them. This again, I want to set in clear light: that we are as a community, deficient, in spite of all our national wealth, and unnecessarily deficient, in the best part of independence—the power to *enjoy* our lives. In this respect we are behind our friends in France, with their two millions of people living upon their incomes.

These two millions of people are not, for the most part, either idle, or frivolous, or wealthy people. Many of them live in the cities, but more of them are quiet people living on their modest properties in the country, and enjoying their competence in a rational way—enjoying friendships, social pleasures, family affections, and all the kindly observances of home life in a way that we have little idea of—in away that the tourist of Paris sees nothing of. We have much to learn from the French, and among the things that we have to learn are some that may surprise us. One of these things is the comfort, the unity, and the permanence of French homes. The French home and family, their happiness, their unity, their permanence, these have been developed by the combined industry, thrift, and domestic sentiment of the most intelligent people in Europe, and especially by its great middle class. We have the significant testimony of Prince Bismark "that the French nation has a solidity such as no other nation of Europe enjoys." and Mr. Matthew Arnold, from whose *Mixed Essays* I quote, adds: "This can only come from the broad basis of well-being, and of cause for satisfaction with life, which in France, more than in other countries, exists." If we had two millions of people, or one million, who were enjoying a competence, earned or inherited, can it be doubted that we should be a happier people, and a better one, than we are? France and the United States have this important feature in common—in each country nearly one-half of the people live directly by agriculture; but our country homes and families have not attained the comfort or the permanence of these—T. M. COAN, in *Harper's Magazine for November*.

Milk Poisoned by Sewage Water.

(From the Liverpool Post.)

What appears to be a terrible case of milk poisoning is reported from Rochdale. There has been an alarming outbreak of typhoid fever in the town lately, upward of twenty persons being infected, of whom eight are known to have died. From investigations made it seems that the families in which the deaths occurred were all supplied with milk from a particular farm. An examination of the farm premises in question led to the discovery that there was a well under the kitchen in which sewage water was found, while in front of the farm buildings was a cesspool in a filthy state. The borough medical officer of health, at an inquest of one of the victims of the poisoned milk, said no doubt the milk from the farm in question, polluted by the sewage water, had caused the outbreak of typhoid fever which proved so fatal.

THE apparent cause of the downfall of John A. Woodward, who has absconded with $82,000 from the Boston city treasury, was an actress known as Imogene. Her maiden name was Amy Louise Knowlton. He fell in love with her, married her, maintained her in a costly home when she stayed in Boston, and paid the heavy losses of her unsuccessful tour as a star. The Boston *Herald* says that some of the bills which Woodward had to meet were for breakage in hotels when his wife got drunk.

GENERAL.

"I AM satisfied with my lot," said a real estate owner who held a piece of city ground worth $5,000 a foot.

THE Earl of Cawdor and party, numbering six guns, recently succeeded in bagging the extraordinary number of 566 hares in one day. Gamekeepers and gillies were, of course, unable to carry them, and they were conveyed to the castle in carts.

DEAD Lake, in California, is peculiar in having no visible outlet, though a large stream runs into it. The Indians believe that it is bottomless and marks the spot where a wicked tribe once sank into the ground. No Indian can be induced to go near it.

AN important piece of patronage is likely to fall this year into the hands of the Emperor of China. The Grand Lama of Thibet, the personified god of the country, is dangerously ill, and the priests have addressed a memorial to the Emperor of China praying him to elect a successor to whom the dying Lama can impart his divine attributes, or rather his soul, which is supposed to be that of Tzon Jappas, the founder of this branch of Buddhism. The nomination of a successor remains with the Emperor of China as suzerain of Thibet, and the appointment, if it may be so called, is a valuable one, the income of the Lama been over $2,000,000. The Lama lives in a magnifient palace, the roof of which is covered with gold, and in it there are several hundred idols of the same metal.

LONDON has a police force of 10,911 men, and furnishes a large field for their work. During the past ten years 190 persons have been killed by light wagons, and 7,962 wounded; 474 killed and 4,144 injured by heavy carts; and omnibuses and street cars have killed 151 and injured 1,655. Each year there are nearly 10,000 children and more than 3,000 adults reported to the police as lost or missing. Last year about two-thirds of the children and one-fifth of the adults were found and restored to their friends by the police; the remainder returned home, or were found, dead or alive, with the exception of 141 adults and 25 children, of whose whereabouts no intelligence has ever been received. Last year 259 persons committed suicide, and 404 others attempted self-destruction, but were prevented from so doing.

THE last survivor of the Medusa has just died at Bordeaux. Cæsar Alphonse Henry was born at Paris in 1813, and three years afterward his father embarked in the Medusa with his whole family of eight persons. Every one knows the fate of the Medusa. Of its living freight of 450 souls, 175 were put on the raft which Gericault has rendered memorable in his picture, 16 remained on board, and 260 took to the boats and gained the African coast, nearly 100 miles from the French settlement at St. Louis. The Henry family were among these last. The three-year-old child walked part of the way across the burning, waterless sands; part of the way he was carried by the sailors. The little caravan strewed its route with corpses, but the survivors arrived safely at St. Louis, and among them was the Henry family, safe and well from the eldest to the youngest—a result mainly due to the remarkable energy of the father.

A LION tamer in a menagerie at San Francisco gave a *Chronic* reporter some cruel facts about the training of beasts. He said there was real danger in the business. He had seen two men killed, and was badly bitten once himself; but he charged these mishaps to carelessness and too much mercy. "You learn to tell," he explained, "what kind of a temper the beasts are in, and conduct yourself accordingly. It ain't hard to dodge them. If they spring straight at you all you've got to do is to jump a little on one side, and if they dive high for your throat you dive under 'em. There's never more than one goes for you at a time, and that don't occur often. The wild ones are better and safer. This is because a lion used to a cage and to being poked and teased is less afraid of you. I'd sooner handle ten lions just from the jungles than one that's used to the public. When I first got into a cage of untamed ones I'd have a fire near by, with three or four iron rods in it, red hot. If the beasts go for me, the men stand ready to jab the irons into their mouths and make 'em let go." He scouted the idea that lions could be governed except by fear, excited by inhuman treatment. He tried never to err on the side of gentleness, and had recently killed a lion by striking it a little too hard on the head.

Sea Music.

The tide rises, the tide falls,
The twilight darkens, the curfew calls;
Along the sea sands damp and brown
The traveller hastens toward the town,
And the tide rises, the tide falls.

Darkness settles on roofs and walls,
But the sea in the darkness calls and calls;
The little waves with their soft white hands
Efface the footprints in the sands,
And the tide rises, the tide falls.

The morning breaks: the steeds in their stalls
Stamp and neigh as the hostler calls;
The day returns, but nevermore
Returns the traveller to the shore,
And the tide rises, the tide falls.

The Birthday.

OF THE BABY MADE FAMOUS IN DICKEN'S AMERICAN NOTES.

The Gentleman who, while a baby, was unconsciously immortalized in Charles Dickens' "Notes" of his trip to St. Louis was met yesterday by a Republican reporter. It was the gentleman's birthday, and that circumstance led to the disclosure of facts comparatively little known regarding the identity of characters described in the "American Notes" of the great novelist.

The pretty little scene on board the boat between St. Louis, as printed in the "Notes," was of the most charming and soul-felt pictures of character and emotion that ever warmed the heart in fact or fiction, and Forster said that of all the writings of Dickens, it was Lord Jeffreys' favourite passage.

In a letter to Forster, dated on board the boat, April, 1842, Dickens gives the story, which for freshness excels the printed account in the "Notes," and its publication will be new to many. It runs as follows:

THE LITTLE WOMAN.

"There was a little woman on board with a little baby; and both little woman and child were cheerful, good-looking, bright-eyed, and fair to see. The little woman had been passing a long time with a sick mother in New York. The baby had been born in her mother's house, and she had not seen her husband (to whom she was now returning) for twelve months. Well, to be sure, there never was a little woman so full of hope, and tenderness, and love, and anxiety, as the little woman was; and there she was, all the live long day, wondering whether he would be at the wharf, and whether he had got her letter, and whether, if she sent the baby on shore by somebody else, he would know it, meeting it in the street; which, seeing that he had never set eyes upon it in his life, was not very likely in the abstract, but was probable enough to the young mother. She was such an artless little creature, and was in such a sunny, beaming, hopeful state, and let out all this matter clinging close about her heart so freely, that all the other lady passengers entered into the spirit of it as much as she did; the captain (who heard all about it from his wife) was wondrous sly, I promise you—inquiring every time we met at table whether she expected anybody to meet her at St. Louis, and supposing

SHE WOULDN'T WANT TO GO

ashore the night we reached it, and cutting many other dry jokes which convulsed all the hearers, but especially the ladies. There was one little, weazen, dried-apple old woman among them who took occasion to doubt the constancy of husbands under such circumstances of bereavement and there was another lady (with a lap dog) old enough to moralize on the lightness of human affections, and yet not so old that she could help nursing the baby now and then, or laughing with the rest when the little woman called it by the father's name, and asked it all manner of fantastic questions concerning him in the joy of her heart. It was something of a blow to the little woman that when we were within twenty miles of our destination it became clearly necessary to put the baby to bed, but she got over that with the same good humour, tied a little handkerchief over her little head and then came out into the gallery with the rest. Then, such an oracle as she became in reference to the localities, and such facetiousness as was displayed by the married ladies, and such sympathy as was shown by the single ones; and such peals of laughter as the little woman herself (who would just as soon have cried) greeted every jest with. At last there were the lights of St. Louis, and there was the wharf, and there were the steps; and the little woman, covering her face with her hands and laughing or seeming to laugh

MORE THAN EVER.

ran into her cabin and shut herself up tight. I have no doubt that in the charming inconsistency of such excitement she stopped her ears least she would hear him ask for her; but I didn't see her to do it. Then a great crowd of people rushed on board, though the boat was not yet made fast, and was staggering about among the other boats to find a landing place; everybody looked for the husband and nobody saw him, when all of a sudden, right in the midst of them—God knows how she ever got there—there was the little woman hugging with both arms round the neck of a fine, good-looking, sturdy fellow. And in a moment afterwards, there she was again dragging him through the small door of her small cabin, to look at the baby as he lay asleep. What a good thing it is to know that so many of us would have been quite down-hearted and sorry if that husband had failed to come."

THE BABY

It will be a surprise to many in St. Louis to know who were the parties so feelingly touched by the pen of Dickens. The baby alluded to, which has since grown up to manhood, is Mr. Charles R. Garrison, the eldest son of a well-known citizen, D. R. Garrison, Esq. The "little woman," the mother of Chas. R Garrison, died about six years ago. Her name was Annie Noye Garrison, and her father, Richard Noye, was a native of Plymouth, England. He was a local Methodist preacher, and resided many years in Buffalo, New. York., where his son, John T. Noye, still resides, the proprietor of the largest burrmilling establishment in the United States. Mr. Charles R. Garrison, aforesaid "baby," was 39 years old yesterday, having been born in Brooklyn, N. Y., October 12, 1841. His mother brought him by way of Pittsburg, and, taking a Ohio river steamer for St. Louis, they had unawares fallen in with and had their little history embalmed by the pen of Dickens.

Mr. Garrison has no memory of the event described by Dickens, but as he grew up his mother frequently rallied him on the figure he cut in the "Notes."

About Wine.

The five principal brands of Bordeaux wine are the Chateau d'Yquem, the Chateau Laffitte, the Chateau Margaux, the Chateau-Latour, and the Haut Brion. The Chateau and the domain of Yquem belong to the family of Sur-Saluces, who bought it in 1785 from the Seigneur Sauvage d'Yquem. The domain covers 360 acres, about two-thirds of which are flanked with the vines which yield the wine. The average yield of the best quality is 120 barrels of 200 gallons each, and the prices realized vary very much; for while the vintages of 1859 and 1861 were sold for $1,200 per barrel, those of 1858 and 1867 fetched little more than half the sum. Chateau Laffitte belongs to the Rothschilds, to whom it was bequeathed by the lat Baron James de Rothschild, who purchased it in 1867 for $828,000 the average annual yield of Chateau-Laffitte is 180 barrels of 200 gallons each, and of this 140 barrels are first-class wine, fetching as a rule 1,800 per barrel. Chateau-Margaux is of verv ancient origin, the site of the present house being that of a fortress belonging to the family of Montferrand. Vines were not planted on the domain till 1750, and in 1802 the property was purchased by the Marquis de Laconilla, who pulled down the old castle and built a very handsome chateau, which was bought by Count Aguado in 1830. He sold it for $1,000,000 to a Paris banker, M. Pillet-Will, three or four years ago, the Margaux domain yields upon an average 155 barrels of wine, each being worth from year to year $1,600. Chateau Latour, the joint property of MM. de Flers, de Beaumont, de Graville, and de Courtevron, the descendants of the Segur family, belonged in the seventeenth century to a secretary of Louis XIV.; and this vineyard, the produce of which is nearly all exported to England, yields about 90 barrels of first-class wine. The vineyard of the Chateau-Brion, which belongs to M. Amedee Larrien, covers about 120 acres, and now grows about 100 barrels of first-class wine.

The price of the Haut-Brion and the Chateau-Latour may be put a trifle lower than the Chateau-Margaux; so that, taking these five vineyards, one will not be far wrong in estimating that they yield 645 barrels for 129,000 gallons), worth, when purchased immediately after the vintage, a million of dollars.

MIRTHFUL MORSELS.

To live long—grow tall.

THE mule understands the art of heeling.

SONG of the mouse: "Hear me gnaw ma."

A TWO-foot rule—making "rights" and "lefts."

A BEGGAR set up business the other day with a small sign reading, "help wanted."

"THERE is no place like home," repeated Mr. Henpeck, looking at a motto, and he heartily added: I'm glad there isn't."

WHEN girls are young they like half a dozen birthdays a year; but as they grow old they don't care to have even one.

THE difference between a goat and a Scotch-man is this: The one delights in cold oat meal and the other delights in old coat meal.

TAKEN together, all the beauties of art and nature do not interest the inquisitive female so much as the view she gets through a keyhole.

AUTUMN gilds the leaf. Of course she does. That's her business. If she didn't we'd get some sort of a machine to do it for her and dock the old gal's wages.

RECITATION room—Professor: "X., do you know the meaning of that word?" X. hesitates. A whisper. Professor: "your friend is right."

ISN'T it kind o' curious that no woman goes to the telephone to answer a ring without wondering if her hair is all right and her train in proper shape?

A COUNTRY girl visited a music shop, and asked for "The heart boiled down with grease and care," and "When I swallowed home-made pies." The attendant at once recognized what she desired.

DURING his recent visit to Hamilton the Marquis of Lorne was treated to a fifteen-minute address in ancient Gaelic. He is now prepared for a visit from his mother-in-law.

SOME tasteful individual very correctly remarks that the best lip-salve in creation is a kiss; the remedy should be used with great care, however, as it is apt to bring on an affection of the heart.

COUNTRY schoolmaster: "How many hens have you?" Boy: "Well, one died, and the other didn't live." Schoolmaster: "Then you have none?" "Oh, yes, we have got six that ain't hatched yet."

CHEMISTRY recitation: Professor—"what is water?' Student. "water is an article used as drink." Professor, interrupting—"Can you name any of its properties?" Student—"Well it occasionally rots boots" *Exeunt omnes.*

WHEN a Yankee is struck by a thunderbolt and knocked endways clear across a ten acre lot. the only great regret he feels, upon recovering consciousness, is the disheartening fact that he can't capture the bolt and exhibit it for money.

"'PEARS to me your mill goes awful slow," said an impatient farmer boy to a miller. "I could eat that meal faster 'n you grind it." "how long do you think you could do it, my lad?" quoth the miller. "Till I starved to death," replied the boy.

CHARLES FOX and his friend Mr. Hare, both much incommoded by duns, were together in a house, when, seeing some shabby men about the door, they were afraid they were bailiffs in search of one of them. Not knowing which one of them was in danger, Fox opened the window, and, calling to them, said: "Pray, gentlemen, are you Fox-hunting or Hare-hunting?"

PROF. OLDBERG, of Washington, recommends various changes in the pharmaceutical nomenclature, which are vigorously opposed by the druggists, who don't propose being swindled out of their godlike prerogative of charging extra for their Latin, and putting down five cents worth of potash as ten cents worth of potassa pura, misc, cum nihil, id est omnes, dissolved in aqua, fifteen cents extra.

"AN acute observer," said Dr. Borum, "can easily detect the nationality of a man. Now, one could easily tell that yonder fellow unloading the cart was Hibernian." Here the horse twisted his head around and threw off some of his harness, and the unloader shouted: "Make pehave yourself mit your head dere, you tuyftll, vill you?" which rather shook the doctor's reputation as a physiognomist.

PAT—"Och, Bridget, did ye niver hear uv my great spache afore the Hibernian society?" Bridget—"No, Pat, how should I? for shure I was not on the ground." Pat—"Well, Bridget, ye see I was called upon by the Hibernian society for a spache; and, be jabbers, I rose with the enthusiastic cheers of thousands, with me heart overflowing with gratitude, and me eyes filled with tears, and the divil a word did I spake."

"ARE seeds of the future lying under the leaves of the past?" is the very pertinent inquiry of the knowledge seeker. There may be; or it's barely possible that the seeds of the past are lying under the leaves of the future or the leaves of the future may be lying under the seeds of the past; or the seeds of the leaves may be lying under the future of the past—at any rate, something is lying, and if you expect to get through a heated political campaign like this without it, there's where you dispose of yourself.

A GENTLEMAN who has a bill against Gilhooly has been bothering that distinguished Galvestonian for weeks for a settlement. The other day he called on him and said: "Now, Mr. Gilhooly, I want you to tell me when you will pay that bill." "didn't I tell you I was going to pay it ultimately?" "Yes but I want to set some day, so I can make my calculations." "I'll pay it ultimately." "Can't you be more definite? When will you pay it ultimately?" "Well, I will pay it d—d ultimately. Now, I hope you are satisfied."

LORD REDESDALE, somewhat shabbily dressed, as is his wont, recently went to see the foreign minister on business. Knocking at the door, he was received by the footman, who, without knowing who Lord Redesdale was, informed him curtly that Lord Granville was not at home. "But look 'ere," continued the flunky, "just run and get me a pint of 'arf and 'arf, will you,"—producing a jug. "Certainly." replied Lord Redesdale, and, taking the jug, away he toddled for the beer. Bringing it back he handed it to the footman, who first of all took a regular quencher. and then Lord Redesdale, politely declining the offer of a drink, quietly remarked: "Oh, by the by, when your master comes in tell him that the earl of Redesdale called to see him!" You may imagine how the footman felt at that sublime moment. and how Lord Granville conveyed his displeasure to him when, after hearing the anecdote told amid roars of laughter in every club he went into, he arrived at home and had an opportunity of hearing the flunky's explanation.

Rare Elephants.

There are now on exhibition in New York two peculiar elephants brought from the mountains of the Malay peninsula, about 800 miles from Singapore. They are remarkable for their small size, being respectively 28 and 36 inches tall; and for being covered with a thick coat of bristly hair or wool. They are supposed to be from five to seven years old. In size they resemble the extinct elephants of Malta, and in covering, those of Siberia. Their woolly coat is attributed to the circumstance that they live high upon the mountains where the climate is cold. The species appears to be all but unknown to naturalists, this pair being the first that have survived the passage through the heated low country to the coast and the subsequent journey by sea. The sailors on the steamer which brought them—the Oxfordshire, Captain C. P. Jones—named them Prince and Sidney. They are described as playful and harmless, and they keep their little trunks stretched out to strangers to be petted. They love to be scratched on the under side of the trunk close to the mouth, and they hold their trunks curled back over their head as long as any one scratches them. Like elephants of larger growth, they keepup a swaying motion, either sidewise or forward and backward. When a visitor lets one of the little fellows take his hand he delicately curls his proboscis around it and carries it gently to his mouth. Then he trumpets his satisfaction.

JOHN BUTLER, a tramp, had seen better days. Finding himself hungry and destitute in St. Clair County, Ohio, he resolved to revenge himself upon those prosperous farmers who had since morning refused to feed him. Stealing a horse from a stable, and some matches from a barroom, he rode away to perform his strange task. During a ride of two miles he set fire to seven barns all of which were destroyed. The line of incendiarism would doubtless have been extended much further, had he not been promptly pursued. He was caught while kindling the eighth fire.

The Gatineau River.

This important river joins the Ottawa river from the north, a short distance below the city of Ottawa, and nearly opposite to where the Rideau river joins the Ottawa from the South. It has for many years been the outlet of a vast timber trade, and still operations are carried on towards its head waters very extensively. The principal firms now carrying on the lumber business "up the Gatineau," are Hamilton Bros., Gilmour & Co., and G. B. Hall & Co. The latter firm has a branch depot and farm on the Desert river. The farm comprises 800 acres, of which 250 are under cultivation, employing 14 permanent farm labourers, under charge of Mr. A. Mooney. The saw mills belonging to the firm of G. B. Hall & Co. are complete and extensive, and are situated at Montmorenci Falls, below Quebec; the logs therefore have to be brought down the Gatineau, and rafted on reaching the Ottawa river—thence floated down the Ottawa and St. Lawrence to the mills at Montmorenci. Only the choicest logs are thus rafted, those of an inferior quality are sold for local consumption. About twenty-six million feet of logs are annually sent on to the Montmorenci mills.

Messrs. Gilmour have extensive mills down the water at Chelsea, about 8 miles from the city of Ottawa and 9 miles from the confluence of the Gatineau with the Ottawa river, and also an extensive and complete steam saw mill on the west bank of the Gatineau river, at its mouth. This latter establishment is driven by a 250 horse-power engine, and has 3 slabbing, and 3 stock gates and one large circular saw for dimension timber, together with lath, picket and shingle machines. The capacity of the mill is about 130,000 feet per day. About 20 million feet of lumber are turned out during the season. A portion of the supply of logs are obtained up the Ottawa river and the balance come from the Gatineau. Most complete arrangements are made to prevent fire. A large Selby fire engine works in connection with a cistern, which is placed on a tower 50 feet high, and which supplies pipes laid through the lumber yard, with hydrants at convenient points. The docks are large and built on piles. About 10 million feet of lumber will be held over this winter. Of the Chelsea mills we shall have more to say at a future time. We shall also refer to the mills of Messrs. Hamilton Bros. at Hawkesbury.

New Brunswick.

We have pleasure in acknowledging receipt of the nineteenth report of the Surveyor-General (Hon. M. Adams) of New Brunswick, for the year 1879. It is full or information—important and interesting to the people of the Province. The readers of the LUMBERMAN will be pleased to know that although, on account of the continued depression of the lumber trade during 1878 and 1879, which caused a large deficiency in the local revenue, a change for the better, as predicted by the Surveyor-General, in his report, had taken place and a great revival in this industry has produced the most gratifying results amongst the people. The renewals for licenses for cutting timber and the annual general sales for the year were small—the total number of square miles sold being only 107, at the rate of $8 per mile. The amount paid in to the Government to renew licenses is given at $15,016, being for 1877 square miles at the rate of $8 per mile. The principal lumbermen, in New Brunswick, according to the official statement are as follows. The subjoined table shows the the superficial contents of the spruce and pine logs cut by each of the largest operators—over 175, in all, as given in the official list:

	Pieces.	Feet.
Adams & Co.	47,268	4 203,876
Cushing & Clark,	11,690	1,169,582
J. & S. Farley,	19,164	2,079,458
A Gibson	12,169	1,098,616
G. G. King	26,017	2,473,328
Alex. Morton	13,694	1,554,415
Wm. Muirhead	51,456	5,008,287
Alex. Morrison	15,070	1,746,001
Geo. McLeod	71,634	7,421,899
John McLaggan	19,075	1,514,549
Hugh McLean	17,482	1,762,146
J. D. Ritchie & Co.	43,264	4 132,606
J. B. Snowball	158,123	17,980,680
Stephenson & McGibbin	36,595	3,108,600
P. R. Whitney	20,890	2,593,000
John Young	28,923	3,180,555
Total taken out	854,247	88,856,803

Also pine timber, 1,010 pieces, equal to 868 tons; besides hemlock logs, 810 pieces, equal to 92,750 feet, and cedar logs, 38,323 pieces. The statement is certified to by J. A. McCallum and Edward Jack, Official Lumber Agents. It will be interesting to compare the statement of 1880 with the former year.

Winnipeg.

The Winnipeg *Times* gives an extended list of the building operations in the City of Winnipeg during the current year. The number of houses erected is stated to be 261; the cost of which amounts to nearly one million dollars. If counted by tenements the number would reach 400 dwellings and stores. The city covers a site of about 2,000 acres or nearly three square miles. The assessment in 1874 was a little over $2,000,000, last year it reached the sum of $4,690,160. The taxation rate is given at 15 mills on the dollar. After the Red River troubles had been suppressed, more than ordinary attention was directed to the North West, and a tide of immigration set in, which gave Winnipeg its first impetus as a rising city. Manitoba was constituted a Province, with Winnipeg as the Provincial capital. This gave a metropolitan character to its place. In November 1873 the city was incorporated, at which time the population did not exceed 2,000—now it numbers about ten thousand souls. In 1870 the place was known as Fort Garry, the chief trading post of the Hudson's Bay Company, and a population of about 300, the majority of whom were half-breeds and Indians, employed by the Hudson's Bay Company. The carrying trade of the country has increased immensely, consisting of general merchandise, agricultural implements, stock, furs, coal, wood, lumber, immigrants' effects, and farm products of all kinds. A large amount of lumber has been towed in barges from the saw mills on a number of rivers that flow into Lake Winnipeg. Three brick yards have been established during the year, which with one previously in operation, must have manufactured 3,000,000 bricks this season. There are two grist mills, one foundry and machine shop, six steam saw mills and lumber establishments, two breweries, two malt houses, one distillery, two cigar manufactories, a soap factory, a biscuit factory, and thirty-four hotels. The principal contractors and builders in this, city were Hugh Sutherland & Brothers.

Belleville.

The latest from Belleville is, that lumbering operations on the River Moira, are going on vigorously. The principal operators on the river are, H. B. Rathbun & Son, Millpoint; Gilmour & Co., Trenton; also Sutherland, Caniffton, and William Sutherland, of the Steam Mills, on the bay, two miles east of Bellleville. Messrs. Rathbun and Gilmour are also operating on the River Trent, and their cut of logs this season will make about twenty million feet of lumber for each. Messrs. Sutherland will each take out about three million feet.

The following quantities are reported as being shipped under the Customs' supervision this season, from the port of Belleville, up to 1st Nov., viz.: Lath, 8854 M, $2498; Hop Poles, $264; Heading, $1404; R. R. Ties, 6500 pcs, $1815; Lumber, 11,393,000, $110,828.

Mr. A. Waters, harbour master, reports that the barley shipped this season from Belleville will overrun 600,000 bushels, whilst only 465,000 bushels were shipped in 1879.

Trenton.

The Customs report shipped from the Port of Trenton, up to 18th Nov. 1880, as follows;

Lath, 3,563 M.	$3 494
Lumber, 23,190,000 feet	292 669
Staves, 1,171 M.	3 809
Stave Bolts, 150 cords	450
Pickets, 31 M.	230
Other woods	3 170
	$303 822

Montreal.

At the port of Montreal last week the season for lumber export was reported as about closing, yet a large quantity of lumber remained on the wharves at Hochelaga. There were four more ships to be loaded to complete the season's shipments. Two were loading at Hochelaga, and the other two are expected there daily. It is necessary, however, it is stated, that the balance of the lumber should be sent away to some more sheltered place than the Hochelaga wharves offer before the setting in of winter. The New York Lumber Company, to whom it chiefly belongs, are at present employing barges and like craft to convey it to New York. It was expected the lumber will be removed during the next two weeks.

Napanee.

Up to 1st Nov. 1880, the Customs report shipped from the Port of Napanee, which includes Mill Point, as follows:—

Lath, 23,189 M.	$9 728
Plank, &c., 19,607,000 feet	163 708
Shingles, 3,420 M.	6 060
Staves, 352 M.	720
Stave Bolts, 390 cords	701
R. R. Ties, 75,913 pcs	15 723
Other woods	4 959
	$201 599

The Chaudiere.

From Ottawa we learn that the last lumber barges for the season were loading on Monday, 8th inst. The Chaudiere saw mills are yet running, and will not close as long as the present soft weather continues. The stock of lumber on hand for wintering is comparatively small, and is principally sold. Next week we intend to give a short sketch of the extensive saw mills at the Chaudiere.

Rice and Cheese.

We all know that rice is very nourishing and wholesome; indeed, it is said to constitute the chief food of one-third of the human race. Rice and cheese cooked together are excellent. For this we take any quantity of rice—say half a pound. Wash it well, for if rice is well washed in the first instance it is not so likely to burn afterward. Put it in a saucepan with cold water to cover it, and bring it to a boil, then drain it and return it to the saucepan with a pint and a half of milk, a little pepper and salt, and a piece of bread and butter about the size of a fourpenny piece. Let it simmer gently till it is tender, and if necessary add a little more milk, but it ought not to be moist. While it is boiling prepare a quarter of a pound of grated cheese. Grease a dish with bacon fat; spread the rice and cheese upon it in alternate layers, the cheese forming the uppermost layer. Put a little more bacon fat over all, and put the rice in the oven to brown. Serve as hot as possible.

THE NORTH WESTERN LUMBERMAN.—We have pleasure in referring to this excellent journal, and propose to make it a model for the CANADA LEMBERMAN. Of course it will take some time to come up to this standard, but it is best to "aim high." Our big brother says, that for 1880-1 it will more than ever merit the title of "the first trade journal in the world." So mote it be. "The Lumberman's Directory" is the title of a useful book, compiled and published by W. B. Judson Esq., editor of the "North Western Lumberman." It locates every saw and shingle mlll, of any account, in the great white pine districts of the North West, and South of the Ohio river. This work must prove of great value to all connected with the lumber trade in those regions. A similar work is much needed in Canada.

THE four best shots in England, outside of professionals, are the Earl De Grey, Lord Walsingham, Lord Huntingfield, and the Maharajah Duleep Singh. Lord Dacre, Lord Leicester, Lord Henniker, Lord Ripon, and Lord Hartington are also regarded as good shots.

MINING NEWS.

THE HIBBARD ANTIMONY CO.

A company bearing the above title has recently been organized in New Brunswick, with a capital of $650,000 divided into 130,000 shares of $5 each, and $100,000 in the treasury.

Among the shareholders of this company, says an exchange, may be found some of the most influential capitalists of Boston. Hon. W. B. Fowle is President, Hon Francis Hibbard of New Brunswick, Lewis Coleman, Stephen N. Stockwell and Thomas F. Temple of Boston, Directors, and J. W. Kimball, of Newton, Secretary and Treasurer.

The company has completed the purchase of the valuable mining property formerly owned by the Lake George Antimony Company, situated in the parish of Prince William, York County, N. B., and the title deeds have been passed and placed on record. The President and Directors have just returned to Boston from a visit to the mine and express themselves as greatly pleased with the developments and prospects of the company.

The property of the company consists of 900 acres of land, on which there are extensive deposits of antimony ore. The buildings, machinery and other improvements have cost over $70,000. Although this property is fully equipped with all necessary machinery for doing a large mining business, the new company is removing everything which falls below the present standard, and are replacing the same by the latest and most improved inventions, among which is one of Bradford's celebrated concentration works, which will be in operation in a few weeks, and is guaranteed to concentrate 30 tons of ore in 10 hours.

No less than six shafts, or slopes, have been sunk on the property, ranging in depth from 40 to 130 feet, all of which develop very rich ore in great quantities. The veins are true fissure veins, dipping to the north at an angle of about 45 degrees. At the surface they are from three to four inches thick, and increase in thickness and purity as they descend, till, at a depth of 130 feet, the vein or lode is 36 inches thick and of remarkable purity, assaying 75 per cent. pure metallic antimony.

Two of these veins have been opened about 75 feet apart, and have been traced on the company's property for considerably more than a mile in length. Four gangs of men are now at work in the shafts, taking out very rich ore, and, after some further preparation, the company expect to employ over 100 men.

The property is situated in the midst of a large farming district, where supplies of every kind are abundant and cheap; hard wood can be bought, laid down at the mine for $1.25 per cord, and the usual price of labor is $1 to $1.25 per day.

The mine is three miles from navigable water on the St. John River, and only six miles from railway communication by a leve road, now in course of construction. The ores or smelted metal can be shipped from the port of St. John, N. B., to any port of the United States or England at a trifling cost. The supply of antimony for the past 50 years has been derived almost entirely from the Island of Borneo, but this supply is now running short, while the demands and uses for the article are increasing on every hand, so much so that this company has received no less than three inquiries from large dealers in England, wanting to know if they could obtain anything like a large supply of antimony in this country. A written offer has been received from one of these parties, the largest smelter and dealer in the article in the world, offering to enter into a contract for 500 tons of antimony ore per month for a period of three years, on a basis of about $110 per ton for such ore as this mine will will produce, payable in cash on delivery; and, when it is remembered that this ore can be mined and laid down at the port of delivery at less than $30 per ton some idea can be formed as to the immense profits that will accrue to the stockholders of this company. Another very important feature in this enterprise is that it has passed through all the experimental stages of uncertainty and doubt, and has now become an assured fact, a reality that can hardly fail to produce the most gratifying results.

CAPE BRETON OIL REGIONS.

The Cape Breton Oil and Mining Co., is thus referred to by the Port Hawkesbury *Beacon* man, who has been visiting this location. He says: the "Cape Breton Oil and Mining Company"—of which Major Smith is

manager—have up a splendid rig on the land just across the road from the widow McDonald farm, and we were permitted to see the drill in operation, and also witnessed the performance of "drawing the tools," pumping, etc. When we were there the drill had gone down about three hundred feet—the result of a few days' work, and it is calculated that the well will be completed in about three weeks. Mr. Thomson, the operator, considers the indications good, and hopes to obtain a show of oil very soon. The derrick is 25 feet in height; the drill cuts an eight inch hole, and is worked with a cable—a system of drilling, which, although new in Cape Breton, is the favorite in the great Pennsylvania oil fields, and is said to be the most effective mode of sinking wells. The well-house contains all the necessary equipments for saving labor, and the great machinery is worked by operators Thomson and Murray, with a few assistants, in an astonishingly smooth manner. The writer further says—"The Bay View House," Whycocomagh, thirteen miles distant from the oil location, presents the appearance of a veritable Mining Exchange just now. While we were there on Friday and Saturday last the following gentlemen directly interested in the Cape Breton oil and mineral fields made the "Bay View" their headquarters: Dr. Rae, Mineralogist, of New York; Mr. Roberts, of Boston, owner of the Bay of Fundy stone quarries; Mr. Fowle, of Fowle & Carroll, Boston, who is largely interested in the Oil Company of which Mr. Loughead is manager; Mr. Theodore Hale, a mining expert, recently from Colorado, and who has explored the mining districts of Nevada and California; Capt. Nelson, of Halifax, who anticipates operating upon territory held by him in the vicinity of the Lake. J. S. Loughead and Major Smith, are the resident managers of the oil wells at the Lake.

A syndicate of Boston capitalists has been formed for the purchase of a valuable mining property on Chaudiere River, in the Province of Quebec. This new corporation is to be capitalized at 50,000 shares, and will be known as the Boston and Chaudiere Gold Mining Company. Work on the property is to be commenced immediately.

Mr. Munson is shipping thirty cars of iron ore per week from the Sexsmith mine at Madoc, and Messrs Coe & Mitchell make a weekly shipment of twenty-five cars from the Hematite mine, and will increase this shortly to fifty cars weekly. The Seymour mine is also being worked extensively.

OTTAWA VALLEY.

Mr. Garrett, geologist, Ottawa, states that a mine of red jasper, banded with beautiful yellow tints, has lately been developed in the township of Hull, and the jasper being a silicate is capable of receiving a fine polished surface. This mineral is used chiefly for urns and jewellery.

Mr. Garrett also reports the discovery of a galena mine, in the Township of Fitzroy, bearing pure ore at 80 per cent. The deposit is said to be large and not many miles from the city of Ottawa.

A very extensive deposit of iron pyrites is also reported, at Le Faivre village, from which ten thousand tons could be supplied forthwith, at a very moderate cost, as the mine is said to be within one mile of the Ottawa River. This is very opportune, as, should the French capitalists now in the Ottawa Valley region buying up large quantities of Phosphate of Lime, as well as phosphate mining locations, for the purpose of manufacturing superphosphates, commence work on the large scale proposed, the iron pyrites will come in just at the right time and place.

THE RAINS AND THE LUMBERMEN.—We (St. John *Sun*. Nov. 2) understand that the great rains have had the effect of bringing to the ponds of the Bay mills, from St. John to Albert County, all the logs which had been hung up awaiting a freshet. Those mills will accordingly have a good Fall's sawing.

We also learn that the Grand Falls jam of logs started again yesterday at 3 p.m., and the logs were running all the rest of the afternoon. A telegram to the *Sun* states that the Arostook Falls jam had broken and the logs were running past Andover at 9 yesterday morning.

DOM PEDRO, Emperor of Brazil, wished to test a certain railroad brake. He had one adjusted to a car, and started off for a trial trip. The engineer soon saw what seemed to be a big rock on the track ahead, and applied the brake, stopping the train within a few feet of the obstacle, which proved to be of pasteboard.

The Greatest Steamships of the World.

[N. Y. Journal of Commerce.]

The Great Eastern, 18,916 tons, 2,600 horse power, was built at London, begun in 1854 and finished in 1858, by J. Scott, Russell & Co. Length 670 feet 6 inches, breadth of beam 82 feet 8 inches, depth of hold 45 feet 2 inches; owned by Great Eastern Steamship Company, London and Liverpool. It is difficult to state her precise cost, since the company engaged in her construction failed soon after she was launched and before she was fitted up and sold the hull (if we remember rightly) for £160,000, much less than it had cost. We once saw a statement that she had cost, when ready for sea, $3,880,000, but we have no means of verifying the figures. The total loss of money on this steamer up to 1875 was estimated at one million pounds sterling.

Arizona, 5,147 tons, 1,200 horse power, built on the Clyde in 1879, by J. Helder & Co. Length 450 feet 2 inches, breadth of beam 45 feet 4 inches, depth of hold 35 feet 7 inches.

City of Peking, 5,079 tons, 1,000 nominal horse power (effective 4,500), built by Delaware Shipbuilding Company, of Chester, Pa., in 1874. Length 450 feet, breadth of beam 48 feet, depth of hold 38 feet 5 inches. Owned by Pacific Mail Steamship Company, New York.

City of Tokio, 5,079 tons, 1,000 nominal horse power (effective 4,500), built by J. Roach & Son, Chester, Pa., in 1874. Length 402 feet 8 inches, breadth of beam 46 feet 9 inches, depth of hold 36 feet 6 inches. Owned by Pacific Mail Steamship Company, New York.

Germanic, 5,008 tons, 760 nominal horse power (effective 3,500), built by Harland & Wolf, at Belfast. in 1874. Length 455 feet, breadth of beam 45 feet 2 inches, depth of hold 33 feet 7 inches. White Star Line.

Hooper, 4,935 tons, 400 nominal horse power; built on the Tyne in 1873 by C. Mitchell & Co. Length 338 feet 2 inches, breadth of beam 55 feet, depth of hold 34 feet 6 inches. Owned by Hooper Telegraph Works, London.

Faraday, 4,908 tons, 500 nominal horse per; built on the Tyne in 1874 by C. Mitchell & Co. Length 360 feet 4 inches, breadth of beam 52 feet 3 inches, depth of hold 34 feet 7 inches. Owned by Liemens & Co., London.

There are also between 40 and 50 other ocean steamers ranging between 4,000 and 5,000 tons. The Hooper and Faraday were both built for cable laying, but are now employed in general freighting business. The Furnessia, launched at Barrow 20 inst., is the largest steamer now afloat next to the Great Eastern, but the cable telegram announcing her launch does not give her dimensions. She is an Anchor line boat. The steamer Alaska, now building on the Clyde for Guion line, is to be 6,500 tons. Her owners say that "her dimensions will be; Extreme length, 500 feet; breadth of beam, 50 feet, and depth of hold from main deck, 38. There will be 150 state-rooms in the first cabin, and the saloon will accommodate 350 passengers. The second cabin will contain berths for 50 persons and on the after end of the main deck will be be quarters for 120 steerage passengers. The Alaska will have a capacity for carrying 2,000 steerage passengers if necessary. Her engines will have a greater power than those of any vessel now sailing the Atlantic. She will be a great improvement on the Arizona, of the same line, which is now the fastest ocean steamship afloat. Her boilers will be heated by 54 different furnaces. The Alaska will, in good weather, be able to cross the Atlantic in six and one-half days. No expense will be spared in trying to make her the finest as well as the swiftest, steamship plying between Europe and New York. She will carry four masts and will be provided with two smoke funnels."

Besides the above there are now building the City of Rome, for the Inman line, to be 8,500 tons; the Servia, fer the Cunard Line, to be 7,500 tons, and the Catalonia for the same line, to be the same tonnage. The White Star Line have also a new steamer building to be named the Majestic, to be larger than any of their ships now afloat.

THE London *Telegraph* says that in consequence of the advance in value of many securities held by the Glasgow Bank, the liquidation is likely to show much better results than were at one time anticipated, and those shareholders who have met their calls in full will be handsomely remunerated.

Wood Pulp.

There is an extensive demand growing up in England just now for wood pulp, and Mr. James I. Fellows, the inventor of the hypophosphites tonic, sends from the city of London to the St. John *Sun*, several items regarding the enterprise. We have no doubt but that the business might be made profitable in Canada, and Mr. Fellows's hints, if adopted may prove useful in time. Wood pulp being cheaper than rags for the manufacture of paper, its superior advantages in the material point of economy must be at once apparent. Indeed so great are these advantages that we are told, no wood country should ignore them. Pure water and good water power are essential, Mr. Fellows says, for the manufacture of this article, which is now revolutionizing, in a measure, a particular branch of industry and trade, The ordinary "soft" woods, such as poplar, basswood, white wood, spruce, fir, cedar, pine, as well as birch maple and hemlock, may all be used with the greatest economy and advantage. Norway, Germany and Sweden, have for several years enjoyed this trade, and have found ready markets in England and in France. There seems no good reason why Quebecers should not embark in an enterprise which promises steady business and large returns, particularly as it is an undertaking for which we are particularly well fitted in every way. The French purchase pulp with only 8 per cent of moisture, while in England no objection is made to buying an article which is composed of 50 per cent of moisture.

In the manufacture of pulp a power equal to one hundred horse is required; a drying house and steam rooms are also necessary. Mr. Fellows believes that saw-mill power could be better and more profitably employed in this new work, than in making deals or boards. "The immense banks of saw dust annually now burnt or set afloat in the streams," he adds, "could be worked into this industry."

The *Printer and Stationer* of London says with regard to the mode of manufacture of this article:—

"The wood in the forest is cut in lengths of 5 feet. The bark is taken off by hand, in order to be done most carefully. In this state the wood is sent to the mill, where it is once more examined, so that no dirt or bark may follow it into the machines.

"The first operation in the mill is the mechanical cutting procedure, performed in a strong and extremely powerful cutting machine. The wood is cut in lengths of ½ to ⅝ inches, and then crushed in a large bast mill.

"The boiling of the wood is done in three horizontal cylindrical rotary boilers, of 5 feet in dia., 32 feet long, holding about one ton of dry pulp each, revolving on six rollers, making one revolution in about three minutes. The pressure used is about 110 to 130 lb. per square inch.

"When the pulp is boiled the unboiled knots are taken away by rotary knotters. The washing of the pulp is done in rag engines, the knives of which only beat, but do not cut the fibre.

"When the pulp is washed, it once more passes through some very fine knotters, of the usual model; then it comes to the sand traps, pulp presses, drying cylinders, and pulp cutters, and then it is ready for packing.

"The black liquor is evaporated by the company's own system. About 75 or 80 per cent of the caustic soda used is, by this system, recovered.

"The fuel for the mill is peat, and some wood. The peat is taken from their own peat bogs. The peat making, in summer time, occupies four steam engines and one water wheel, representing about 60 horse-power, fourteen peat machines, and about 160 workmen. The pulp mill occupies about 100 people, and the power used is about 100 horse-power. The pulp is packed with iron ropes and hessian, into bales of 1-10th of a ton gross weight. The production is about 100 to 105 tons per month.

"The price in the English market ranges from £10 to £12 10s. per ton, and prices are advancing."

From all we can learn on this subject, the more are we satisfied, that it presents a most attractive side to the capitalist. Even coarse saw dust may, with advantage, be utilized in the manufacture of the pulp. We hope our readers will look into this question, and see if a new industry cannot be started that will provide work for many operatives, and at the same time, open up a new channel of trade with England and France. The matter will bear close investigation.

"Hew to the Line."

A LUMBERMAN'S SONG.

Going through the woods my lads
The ringing axe we swing,
And as we ply our merry toil
This cheery stave we sing:
"Let true eye guide each sturdy stroke
True heart and hand combine;"
And "wheresoe'er the chips may fall,
Hew to the line!"

Life's a bush of varied woods
And cross is oft their grain,
But axe and wedge will cleave the knots
And part the log in twain.
The line of duty, fairly traced
By Nature's own design,
Will keep us straight, my lads if we
Hew to the line.

Hard our lot as lot may be,
Spare our fare at best is,
Yet our slumber's sounder far
Than his, who wears a crest is.
This one honest rule we seek,
In shadow or in shine,
"Aye, wheresoe'er the chips may fall
Hew to the line."

He who wields the trusty steel,
To hew a path through life,
Must bear a single heart to guide
His action in the strife.
Then let us pray that, come what may,
This law be yours and mine,
['Tis His, who bosses all the gang],
"Hew to the line."

CHORUS, Hew to the line, my lads
Hew to the line!
Wheresoe'er the chips may fall
Hew to the line!

Captain Eads' Ship Railway.

The *Scientific American* of this week contains two full page illustrations of Captain Eads' proposed railway for transporting ships with their cargo across continents.

Captain Eads claims by his plan to be able to take loaded ships of the largest tonnage from one ocean to another across the Isthmus of Panamr, as readily as can be done by a canal after the Lesseps plan, and at a much less cost for engineering construction.

The project is certainly bold end ingenious, and the projector anticipates no serious difficulties in carrying forward his enterprise. The engravings referred to in the *Scientific American* show the proposed construction of not only the railroad, but the appliance for transferring the ships from the water to the rail.

In addition to the large number of engravings, illustrative of engineering works, inventions and new discoveries which appear weekly, the *Scientific American* has, buring the past year, devoted considerable space to illustrating and describing leading establishments devoted to different manufacturing industries.

This feature has added very much to the attractiveness and usefulness of the paper. More than fifty of the most important industrial establishments of our country have been illustrated, and the processes of the different manufactures described in its columns. The *Scientific American* has been published for more than thirty-four years by Munn & Co., 37 Park Row, N. Y., and has attained a larger weekly circulation than all similar papers published in the country. The publishers assure the public that they have not printed less than 58,000 copies a week for several months.

Shooting at Baloons.

English papers report some experiments, lately made at Dungeness, which show remarkable success in reducing the efficiency of military ballons. An ordinary service baloon was used, and after it had risen to a height of 800 feet was fired at with an 8 inch howitzer at a distance of 2,000 yards. The gunners were not instructed as to the precise range, but were required to find it for themselves. An 8 inch shell was accordingly fired into the air as a trial shot, and this, despite the novely of the target, sufficed to supply the gunners with the necessaay information. The next shot brought down the baloon. The projectile was a sharpnell shell, and the fuse had been so well timed that the shell burst just in front of the baloon, projecting something like 300 bullets through the fabric, and causing its immediated descent.

WOMAN GOSSIP.

Perennial.

She was but a little girl
When I first began to woo,
The completest little girl
Ever doting poet knew.

Still she seemed a little girl
When to maidenhood she grew,
And evermore a little girl
I evermore must woo.

Though her hair may turn to silver,
And her red cheeks lose their hue,
She yet will be the little girl
My love-charmed fancy drew.

And though death's decay should pierce
Her sweet body through and through,
She will remain a little girl
To my enraptured view.

Fashion Notes.

Shell pink is a fashionable color. The husband of the lady who wears the pink usually does the shelling.

It is the fashion to cover the shoulders, back and bosom, with hoods, fichus, and pelerines of various styles and dimensions.

Cashmere designs are more in vogue than any others in the new brocades and damasses, though both large and small flower patterns appear in them.

Large gilded hooks and eyes fasten bonnet strings under the chin, and are used largely also on cloaks and wraps of all kinds that require to be fastened.

Some of the handsomest skirts of the season are made of plush, entirely plain, save that a balayeuse plaiting of doubled satin appears below the edge.

Pointed waists are the leading styles for full dress, while round waists, plaited waists, and blouse designs continue to be employed for plain house dresses.

The new brocaded satins and velvets differ from those of last season's manufacture in presenting large detached figures rather than the small matelasse effects.

The morning-gown is generally made long. It is mostly composed of a deep jacket, loose in front, semi-fitting behind, called a matinee, and can be worn with any skirt.

Plush is the favorite material for open wraps. It is imported in three colors—pink and blue in medium shades, and white. Satin is also used for this purpose, with plush as trimming.

Large sleeves are the universal feature of new wraps. Dolmans are called visites, and for the fall months are of light goods, lined with satins of some rich color and trimmed elaborately.

The new shoe-buckles are beautifully chased and encrusted. One of the favorite designs is a star, and another is the pretty hook and eye, now so fashionable for dresses, in cut steal.

Fancy feathers which have been so much worn will be superseded this fall by ostrich tips and feathers on the most elegant hats and bonnets. Plush will be as much used as velvet.

Buckles are in fashion again, and are used in many forms. Large ones of cut jet are placed midway of the ends of a Turkish sash, and they are seen on hats, cloaks, and dress waists.

Among the novelties this season for evening dresses are satin-faced grenadines with raised designs. They come in every variety of design and tint. They are usually made up over satin or silk.

Very pretty indoor jackets are made in the casaquin style, moulding the waist, and coming down low over the hips. The front is trimmed from the neck down to the waist line with a lace quilling.

A new felt skirt for the winter is as soft as ladies' cloth, yet thick and warm. It is seamless, and measures two yards around. The material is Austrian wool, manufactured in England, and it is called the Princess Alice.

A dress that will be popular with young ladies this season in a combination of cloths of camel's hair with plain surah, such as plum-colored cloth with surah that has a plum ground and many gay bars of pale blue, red, and orange.

Wide collars are used universally upon girls' dresses this season, and sashes are seen everywhere. The latter are often embroidered in a loose and sketchy manner across the ends, and ribbons are also decorated with a little odd stitching.

The most costly bonnet made this autumn was fashioned for a wealthy lady in New York recently. It was a model of quiet taste, being of dark rich maroon plush, with diamonds set in the head of pins, which were fastened tastefully over it. The jewels made the bonnet cost $6,000.

The ends of all tabs and trimmings that depend from the waist or skirt are gathered and finished with a tassel or other ornament. The ends of ribbons and bonnet-strings are either gathered at the end or shirred a few inches above and the ends fringed, producing the same effect.

Combination undergarments of different kinds are destined to revolutionize the old and painstaking modes of making. The prevalence of close-fitting cuirass waists requires the nicest adjustment of all that is worn beneath them, and hence these garments are more than ever in demand.

Waifs.

Said he: "Let us be one." And she was won.

Multum in parvo. The little finger carries the biggest ring.

"Oh, dear! I wish I was dead!" exclaimed a neglected maiden. She had heard that matches are made in heaven.

HINT FOR MAMMAS.—An old lady who has several unmarried daughters feeds them on fish diet, because it is rich in phosphorus, and phosphorus is the essential thing in making matches.

"IF I have ever used any unkind words, Hannah," said Mr. Smiley to Mrs. Smiley, reflectively, "I take them all back." "Yes, I suppose you want to use them over again," was the not very soothing reply.

THE girls who were to be converted recently in St. John's Roman Catholic Church, Concord, were officially informed beforehand by the Bishop that he would not lay his hands on any head that bore banged or frizzed hair.

At a printers' festival, lately, the following toast was offered: "Woman! Second only to the press in the dissemination of news." The ladies are yet undecided whether to regard this as a compliment or otherwise.

PHONETIC.—Maiden aunt to tall young nephew: "As I stood by you in church, Percy, I could not help being struck by your size." Percy: "Very sorry, aunt, but there was such an awfully pretty girl the other side of the aisle, I couldn't help sighing."

"What! that coffee all gone?" "Yis, mam. There isn't a blessed drawin' left in box." "What! four pounds of coffee used up in our small family in one week?" "Small family? Musha, thin, mam, there's two of yez an' the maid, and ther's me an' me foive admirers, who has aich a night to hisself, and how ye can make a small family out of tin o' us is beyant me intirely. I don't know what ye'll do whin I come to fill in th' other two nights o' the week wid young men who wants a sup o' hot coffee for to keep the chills away!"

A NUMBER of French ladies recently had an amicable contest as to who could arrange the most distinguished toilette from the cheapest and commonest material. The prize was awarded, at a breakfast in the country, to a lady whose dress was of *toile d'emballage*, or packing cloth, lined with red, and trimmed with lace, and with wild flowers embroidered on a gold ground, parasol and shoes to match, and twelve button gloves. The embroidery cost eight hundred francs, the lace fifteen hundred, the handle of the parasol six hundred, but the material of the dress cost only seventy-five francs. Nothing is said of the dressmaker's bill.

They were sitting together in the horse car. "I do hate people who are forever talking about their neighbors," said the woman with the peaked hat. "So do I," coincided her companion in the cashmere shawl. "There's Mis' Green," continued Peaked Hat, "continually a carryin' things back and forth. Think she'd better look to home. Goodness knows she and her husband live a reg'lar cat-and-dog life." "Yes, indeed," said Cashmere; "and her daughter Sarah is'nt half cared for. I was tellin' Mis' Jones only yesterday that the way Mis' Green neglected that girl was a cryin' shame. Oh! by the way, did you hear that story about Tilda Smith?" "No! what is it?" exclaimed Peaked Hat, turning half round in her seat in her eagerness, her eyes sparkling in anticipation of the coming treat. But gentle reader, never mind what it was Neither you or I care anything about it. We hate tattling just as bad as Peaked Hat and Cashmere.

A North Carolina Marriage.

Soon after the close of the last war Captain X was appointed a justice of the peace in a country place not far from Raleigh, North Carolina.

His father had been a planter in a rather small way, and his son the captain had acquired considerable experience in the business of managing real estate, drawing up deeds, etc., during the father's lifetime, and then in settling the estate after his decease. Further than this he had no legal knowledge, and, indeed, his entire stock of "book-learning" was small and poorly selected, but any lack in general information was fully made up, for his uses, by self-assertion. Late one afternoon, as he was riding home from Raleigh, he met a young woman and two men, who hailed him and inquired if he was Captain X. The young woman and one of the men wished to be married at once. The other had come as a witness. They had procured the necessary license, but an irate father was on their path, and swore that they should never be married. It was considered on all accounts safest to have the ceremony performed without delay, and try pacification afterward.

Now the captain had never witnessed a marriage, and naturally had no very clear idea of what was usual in such cases. He remembered having seen a book about the house years before with a form for marriage in it, but what the book was and where it was he could not remember.

"Why," said he, when he told the story afterward, "I knew the 'Postles' Creed and Commandments, and at first I thought I'd use 'em to begin on, but then I reckoned, on the whole, they was too durned solemn."

He asked the couple to come to his house, secretly hoping that he could find that book; but they declined, for the reason that the matter admitted of no delay.

A less assured man would have been sorely perplexed, but not he. He lost no time in removing his hat, and remarked, "Hats off in the presence of the court." All being uncovered, he said, "I'll swear you in fust off. Hold up yer right hands."

"Me too?" asked the friend of the groom.

"Of course," said the captain, "all witness must be sworn. You and each of you solemnly swear that the evidence you shall give in this case shall be the truth, th' 'ole truth, an' nothin' but the truth, s'elf you God. You, John Marvin, do solemnly swear that to the best of your knowledge an' belief you take this yer woman ter have an' ter hold for yerself, yer heirs, exekyerters, administrators, and assigns, for your an' their use an' behoof forever?"

"I do," answered the groom.

"You, Alice Ewer, take this yer man for yer husband, ter hev an' ter hold forever; and you do further swear that you are lawfully seized in fee-simple, are free from all incumbrance, and hev good right to sell, bargain, and convey to the said grantee yerself, yer heirs, administrators, and assigns?"

"I do," said the bride, rather doubtfully.

"Well, John," said the captain, "that'll be about a dollar 'n' fifty cents."

"Are we married?" asked the other.

"Not by a durned sight ye aint," quoth the captain, with emphasis; "but *the fee comes in here.*" After some fumbling it was produced and handed to the "Court," who examined it to make sure that it was all right, and then pocketed it, and continued: "Know all men by these presents, that I, Captain X, of Raleigh, North Carolina, being in good health and of sound and disposin' mind, in consideration of a dollar 'n' fifty cents to me in hand paid, the receipt whereof is hereby acknowledged, do and by these presents have declared you man and wife during good behavior, and until otherwise ordered by the court."

The men put on their hats again, the young couple, after shaking their benefactor's hand, went on to meet their destiny and the irate father, while the captain rode home richer in experience.

THE present potentate of Turkey, Abdul Hamid, is described by the Constantinople correspondent of the London *Times* as a nervous, timid man, who is afraid of his own shadow, and who does not venture to ride or drive beyond the limits of his well-guarded private pleasure-grounds. Yet he defies Europe. Though physically a coward, he has something of that peculiar courage which produced the *coup d'etat* of 1851, and when his cowardice and obstinacy are at issue, the latter generally carries off the victory.

The Czar's Bride.

The Emperor Alexander had been in love with the princess Dolgorouki for more than twelve years. He first met her at the residence of her sister-in-law, the princess Dolgorouki-Vulcano, a most honorable Neapolitan. Struck with the grace of the princess Catharine, a blonde of charming simplicity and great beauty, the emperor declared his love, and the affair soon became the talk of St. Petersburg. He established her in apartments on the English quay, and here he has visited almost daily for the past ten years to seek solace in her society from the cares and worries of state affairs. The princess Dolgorouki has given birth to several children, all of them being authorized by imperial ukase to bear the titles of Count and Countess de Gourine, the name of the extinct branch of the Romanoffs. The princess followed the emperor to the banks of the Danube under the name of Mme. Bilejer during the late war with Turkey. Of course the empress knew all about it, but her malady and the coldness of her nature caused her to shut her eyes to the real state of the case. But when the czar desired to legitimatize the princess' children, the empress, the czarewitch, and the grand duke declined to accede. The Czarina determined to leave Russia and find at Cannes a refuge from the insult offered her. The czarewitch avoided the winter palace as much as possible. The influence of the Princess Dolgorouki grew daily stronger in the czar's household. The emperor yielded so completely to its fascinations, that he even showed anxiety to obtain a divorce from the empress and to marry the princess. Now that the marriage is accomplished, it is almost certainly of the kind known as "morganatic," in which the bride stipulates that she and her children will neither assume the rank nor inherit the possessions of the husband. These alliances are not over frequent, but the *Europe Diplomatique* occasionally furnishes us with a list of such marriages entered into by the princes of the royal house of Europe. Besides Victor Emmanuel, Leopold I., of Belgium, and Frederick VII., of Denmark, the latest list embraces some fifteen princes' names, a large majority of whom belong to the reigning house of Germany and Austria.

The Grotto Under Mount Rossi, Sicily.

The eruption of Mount Etna in 1669, says *La Nature*, was the most formidable of historic times. The side of the mountain opened for a length of about four miles, and there issued from it a torrent of lava four miles broad, which, after destroying several villages, and half of the city of Catane, flowed into the sea and formed a promontory two miles long by half a mile wide and sixty feet high. At the same time the scoria and sand thrown out by the craters formed a mountain with a double crest, that was at first called Monti della Rovina, and later Monti Rossi, on account of the reddish color that the scoria from the two crests assumed through the oxidation of the iron contained in it. The higher of the two crests is about 800 feet above Etna, and about 3,000 feet above the sea. In the interior of the cone of Mount Rossi there are two immense extinct craters, exhibiting the characteristic funnel-shape, and the sides of which are formed of scoria in a decomposing state. Up to 1823 no one had had the curiosity to descend to the bottom of these craters; but at this period the intelligent observer, Mario Gemellaro, undertook their exploration. He saw with some surprise a horizontal aperture at the bottom of one of the cavities, and entering it with a torch, he found, after traversing a suite of corridors resembling the galleries of a mine, a large well, into which he caused himself to be lowered by means of ropes. At some feet from the bottom of this well he found a vast rectangular room, at the further end of which there was a passage which grew smaller and smaller, and at last became impassable. This remarkable grotto, which was named Grotto della Palombe, is situated exactly in the centre of Monti Rossi It has now been open to travellers, the decent being facilitated by a stairway, and the cavern being illuminated by magnesium light instead of the former resinous torches.

LEWIS IRWIN displeased his parents, at Gallipolis, Ohio, and while his mother pounded him with a club, his father shot him with a pistol.

BREAD made from whole wheat soaked before been coarsely ground is used in the French army. Sea water used in the kneading is said to add flavour.

A Bride's Mausoleum.

A new church edifice, a princely gift, says *The New York Sun*, at Lebanon, Pa., was consecrated in this back-country borough today. There is quite a romantic story of love and sorrow connected with it. The new edifice cost a very large sum of money, and it is generally known that every dollar was paid by Mr. Robert Coleman, one of the leading members of the "house of Cornwall," founded upon three mountains of iron ore here in Lebanon county, about one hundred and forty miles west of New York. The church is the borough proper. Cornwall, a a few miles distant, is the home of the Colemans, the richest iron family in the state. Monday being the festival of St. Luke, was chosen for the consecration of the magnificont edifice, and it was dedicated with all the rites and ceremonies of the Episcopal church.

Several years ago Mr. Robert Coleman met a young lady of very prepossessing appearance in a tour he made of New England. She was the daughter of a respectable family of Connecticut in moderate circumstances. A mutual attachment followed, and not long after the couple were maried. A short time after the marriage the young bride was suddenly taken ill, and a trip on the continent was arranged by her husband. It was thought that the climate of the south of France, Italy, or Spain would be best for her. All that love and boundless wealth could give was furnished with a most liberal hand The husband was compelled to remain at home on business engagements. It was confidently believed that the bride would soon be restored to good health, and very soon after her departure the husband set about preparing a surprise for her. He supposed that she would be about a year, and he determined to erect one of the most costly residences she had ever seen and have it all finished and furnished in time for her arrival home. She was to know nothing about it until the carriage should drive her to the door from the railway station. Mr. Powell. a Philadelphia architect, was instructed to prepare the plans. The structure was to be in the Scottish baronial style, and Mr. Coleman cared very little about the cost. A fine sight was chosen, broad and level and elevated with a commanding view of a long stretch of the beautiful Lebanon valey.

The Coleman estate comprises about five thousand acres. In one part of it is a brown stable containing some thirty thoroughbred horses. The most valuable animals are quartered in rooms having mirrors on the walls and Brussels carpets on portions of the floor. Five monstrous furnaces are smelting ore night and day on the estate. Three hills contain an inexhaustable suply of ore. These furnaces have made millionaires of a dozen families or more. Robert Coleman is the youngest son of the iron kings of the present line of owners. Interested parties and heirs are scattered in many climes, but Mr. Coleman remains in complete charge of the vast estate. Every thing is conducted in princely style. Every employee lives on the place, rent free. The cottages are models of neatness, cleanliness, and convenience. A church, store, Sunday school, and other necessary wants are fully supplied. The great farm supplies employees with wheat, corn, potatoes, and vegetables at far below market price. Splendid family mansions occupy prominent places. Tally-ho coaches, drawn by four-in-hands, convey the members of the Coleman family and their many visitors to the neighboring towns and railway stations. Hence to the new mansion that was to be erected by Mr. Robert Coleman as a surprise to his bride. it can readily be imagined, was to be something exceedingly grand. The foundations were massive, and built of granite and limestone. The underground divisions were commodious and finished in the most modern style. a hard cement floor was laid. The frames of the large bay windows for the first floor weighed several tons apiece. The superstructure was to have been of marble, iron, and granite. The interior was to be finished in hard wood. The work was proceeding splendidly, and some fifty men were steadily employed. Car load after car load of material was arriving and being put in place. All efforts were made to rapidly push on the work of completion of the work. Every detail of furniture and upholstery had been decided upon. The gardener had received his special instructions. In fact, everything had been fully arranged looking to the rapid completion of the mansion when a tellegram came over the sea that the young bride was ill in Paris. Quickly followed another dispatch that she was dead. Every tool in the new house was dropped. The young husband, stricken with grief, was or a time not to be consoled. He ordered the workmen onthe new mansion to go to the office and draw their pay, and then to remove their tools and other property, In a few days orders were given to tear down what had been put up; to throw in the excavations, and plough the place over. All that remained of what was to be a palace was ordered to be obliterated.

The construction of a beautiful church dedictated here to-day concludes the story. The remains of the dead bride were embalmed and brought back to America, and were then placed in a vault until the construction of the church walls had been sufficiently advanced to receive them. The new edifice is cruciform, 96x75 feet. the floor is of Spanish tile from Valencia. The woodwork is of oiled oak. A massive tower twenty-four feet square rises one hundred feet in the air. The structure is of grey stone, even to the window sills. A hydraulic engine in the basement supplies air for the organ. The style ot finish is old English, with massive granite colums. The leading Episcopal clergymen of the eastern section of the state were present at the consecration, including M. A. De Wolf Howe, bishop of this diocese, who was the consecrator; the Rt, Rev. Dr. Hare, bishop of Niobrara, Indian Terrtory; the Rev. Dr. Oliver, of Nebraska; the Rt. Rev, B. Wister Morris, missionary bishop of Episcopal convention in session last week in New York. The Rev. Chandler Hare is the rector of the parish. The new church has a seating capacity of about five hundred. It was filled to overflowing to-day by the leading citizens of this section of the state.

Messages from the Sea.

A few instances of messages from the sea, reported from time to time to have been found, like Poe's manuscript, in a bottle, may perhaps be taken for what they are worth. A girl picked up in the sea near Barrow a securely corked bottle containing a scrap of old newspaper, on which was indistinctly written: "Gone down off the coast of Ireland, the Steamer Combat, with all hands. Capt. Yates." There was no mention of date on which the ship sank, but the writing appeared to have been hurriedly done. On the shore of the Bay of Luce a bottle was reported to have been found containing the following message, written in pencil on a piece of paper, the writing being much faded: "On the 29th of April, 1876, the ship Herclades was wrecked on the extremity of Patagonia. Crew in the hands of savages. Bring us assistance." During a fearful winter storm, it was conjectured, from the large quantity of wreckage floating about, that many vessels had been lost at the mouth of the Tay in addition to those reported at the time. Some particulars reached the press—whether verified or not the writer is unable to say—that a letter inclosed in a bottle was cast ashore on the Fifeshire coast giving a clue to one of these ships. The letter, blotted and otherwise damaged by sea-water, was written in bold Norwegian characters, and was thus translated: "Schooner Bay, Tonsberg, 25th December, eight morning. We are now in a sinking condition, within sight of the Bell Rock, outside the River Tay. We have had both boats smashed and carried away, and cannot therefore make an attempt to come ashore, We have experienced great hardships during the heavy gales in the North Sea. Greater part of rails, stanchions, and bulwarks are away. We have been laboring constantly at the pumps for three days, and the forecastle and cabin are full of water. Everything is destroyed, and we have but little to eat. We now put our trust in a merciful God, and if it is our fate to die, we hope to arrive at a heavenly throne. The crew is otherwise all well, and asked to be remembered to their dear ones at home—(Signed) H. Mathison, captain of the schooner Bay." The letter bore the address: "To Tonsburg, Norway." The name of the Bay was on the Norwegian shipping-lists, and she would have a crew of seven or eight hands, and is supposed to have been bound, coal-laden, from the Tyne to Norway. This sad message from the sea was reported to the owners. Considering what has resulted from mariners' experiments with bott'es afloat, and how often, after disasters at sea, these have been the means of communication between the living and dead, too much cannot be said in condemnation of thoughtless persons who perpetrate hoaxes of this description.—*Chamber's Journal.*

OLE BULL begged that Mozart's Requiem might be played while he was dying, and it was the last music that he heard,

American Incomes.

There is no table of the average duration of fortunes; but the statistics of business failures in the country since 1866 show that the average *yearly* failures ranged from 1 in 163 in the year 1871, to 1 in 75 in 1876. How many business men in a thousand fail, once or more, during their business lifetime, I cannot learn. The proportion used to be estimated, for New England, at 99 per cent. That is probably too high a figure for the business of to-day, conducted as it is upon much shorter credits than formerly. But the proportion of traders who fail is probably not lower than 75 per cent. of the whole number.

How many of our people live upon their invested means? In 1866 our income-tax returns showed 771,000 incomes of $500 per year and over, and six million incomes of less than $500. But these were not incomes from capital; they were mostly earnings or wages. Probably not one in a hundred of these smaller incomes, and not over 10 per cent. of the incomes over $500, represented the interest upon investments. In France, ten years later, the census returned no less than two millions of people, *rentiers*, who live entirely upon their invested means. In 1877 seven and a half millions of the people —one-fifth of the population—were enrolled as rentes-holders or savings-banks depositors; but it must be added that the savings-banks do not often fail in France, and that sooner or later they are apt to fail with us. Most of these deposits are small ones. But no less than two millions of the French can say with Petrarch, *Parva sed apta mihi* "It is little enough, but it will do for me."

Thus, in spite of the resources of the country, in spite of the almost universal search for wealth, and in spite of the fact that we have a great many rich men at any given time, we still do not have a large class of permanently rich men; we do not even have, like the French, a large class of persons who have a permanent though small competence. The rich American's wealth is extremely volatile; in nine cases out of ten it is "fairy gold. The old land-owners form the chief exception to the rule; especially in our large cities, where the increase of values has been great.

But if our class of permanently wealthy people is small, so also in our class of destitute people. We are fortunate in having few of the very rich or the very poor, in having no such immense and harmful inequality of fortunes as we see in modern England. Our ill fortune is this, that our class of moderate competences is also small, that so few of us, in spite of our opportunities and our labours, have seized the good of even a small assured competence. The land is full of people who have not, on the other hand, and who are not likely to have, any assured competence, however moderate, but who have nothing to expect but labour to the end. That is, indeed, the appointed human lot for the majority in any community; but need it be, in a country of resources like this, so nearly the universal lot? Might not many of us avoid it by a greater care for a moderate competence, a a lessened ambition for fortunes?

Big Harbour Scheme for Montreal.

(From the Montreal Witness.)

A gigantic scheme was presented to the Board of Trade recently by Mr. Shearer. It is stated that the Harbour Engineer sees no practical difficulty in carrying it out, while several of our most prominent and enterprising citizens have declared it to be feasible. Mr. Shearer's plan is to divert the current of the St. Lawrence opposite the city into the channel beneath St. Helen's Island and the southern shore by having various obstructions removed and running a dam, or "peninsula," as he calls it, from Point St. Charles to St. Helen's Island, thus stopping the current from running through the present main channel between the city and St. Helen's Island. Mr. Shearer claims, in the first place, that the dam will prevent the shoving of ice opposite the city and the consequent flooding of buildings in the Griffintown district, and will make of this a still-water harbour where vessels may lie during the Winter. It is estimated that the construction of the dam would raise the water two feet in the river and lower it two feet in the harbor. This would give a head of four feet for mills, elevators and factories, and the transportation of freight. Last, but not least, the dam would afford a roadway across the river upon the construction of a bridge from St. Helen's Island to St. Lambert, thus removing the necessity for a tunnel. This would form not only a highway, but a road for carriages and foot passengers. No estimate of the cost of construction has yet been made, although Mr. Shearer says this scheme will cost no more than a tunnel.

The Coming Revision of the Bible.

It needs to be modified by sound reason. Were the English Bible chiefly a work of art, or a monument of the English olden time, the æsthetic feeling should rightly dominate and a jealous conservatism should watch against modern innovations, by the hand of whatever scholar they might be wrought. We do not deny the literary skill of King James's translators. Their work is artistic in the highest sense. They were men of broad and cultivated minds, and they gave the English people a model of literary beauty and sublimity in their translation (or revision) which compares most favourably with the versions of all other tongues. We may add that in this artistic character of their work they themselves borrowed the phrases and words of Tyndale, which had already become antiquated, and so gave the majesty of hoariness to the other virtues of their style. In looking at their work, therefore, we are beholding a phase of the English language really older than their own time. But we must bear in mind that beauty and antiquity of style are not the paramount considerations in the question of Bible translation. The truth—the truth is what we desire. All other objects sink into insignificance in comparison with this. We seek a perfect translation of the Hebrew and Greek. The idea is of first importance, and the clothing of the idea is secondary. A perfect translation is indeed impossible. A grand sentence must loose something in passing into another language. If it keep its main thought, it must loose its grandeur, it must work some change in the thought. We must, therefore, give up the idea of reaching a perfect translation, although we make it our goal. Which, then, shall we throw out of our car as we advance—the sense or the style? Undoubtedly the latter The only fatal embarrassment in this is at those crisis where the very style enters into the sense, and you cannot tear them apart without destroying both. In such cases we must bow to the necessity and give a bad translation, leaving it to the scholar to explain the difficulty and the real meaning in whatever circumlocutory way he may. Generally speaking, then, we must sacrifice style to sense, and, in doing this at the present time, we may subject ourselves to the charge of iconoclasm. If a rich, round sentence that we have loved to mouth is trimmed to angularity in order to express the truth, the crowd of critics will be apt to overlook the constraining necessity and bestow on us a consentaneous groan. Let us give an illustration. In Acts, xxvi.: 24, the words of Festus to Paul are musical and terse: "Paul, thou art beside thyself; much learning doth make thee mad." It is a strong English sentence; each clause is well balanced. You may compare them to two equal shafts striking the centre. As you read them you are Festus, and you speak with conscious force. Now, shall we dare alter such a rare specimen of telling English? All the beautiful in us rises up in indignation at the thought. And yet we must humble ourselves and our pride of taste for the relentless cause of truth. What is the Greek here? What did Festus really say? * * * The truth is, Festus did not say half as fine a thing as our English sentence, Moreover, he did not mean what our English sentence means, Festus first, in the impetuosity of his feelings, told Paul he was mad; then, correcting himself, with true Roman politeness, he modifies his expression, and says that Paul's learning was gradually bringing him to a condition of madness. The English of what he said is: "Thou art mad, Paul; much learning is turning thee to madness." Our received version makes the two clauses of equal strength, the latter clause merely adding the cause of madness. Moreover, the received version does not recognize the similarity and relation of *maine* and *mania*. If we translate as above we lose a remarkably strong sentence, beautiful in its strength; but, if we leave the beauty and strength undisturbed, we do not have what Festus really said. Now, ye critics, take this instance as a sample, and tell us what we are to do. Are we to cling to principle faithfully, or shall we hold on to principle only until we see a pretty face? What will you have, that which the sacred writers say, or that which King James's translator's say?—The REV. DR. HOWARD CROSBY, in *North American Review.*

THE CANADA LUMBERMAN

AND MILLERS', MANUFACTURERS', AND MINERS' GAZETTE.

ISSUED SEMI-MONTHLY AT TORONTO, ONT.

A. BEGG, - Proprietor and Editor.

TERMS IN ADVANCE (Post-paid):

Business Cards, Forms of Agreement, Bill Heads, &c,. promptly supplied to order, at the LUMBERMAN Office.

Communications, orders and remittances, should be addressed to A. BEGG, LUMBERMAN Office, 33 Adelaide Street West, Toronto.

TORONTO, ONT., NOVEMBER 15, 1880.

BARYTES OR SULPHATE OF BARYTA.

This mineral is of considerable economic value, being used for many purposes, but principally for mixing with white lead and for enamelling. It is scarce in the whole of North America, and consequently very large quantities are annually imported into the United States from England and Germany, but chiefly from the latter country. We understand that there are but two places in the United States where the raw ore is pulverized and prepared for use—the one, New Haven, Conn., and the other St. Louis, Mo. At the former there is, or rather there *was*, a mine—for we believe it is nigh exhausted—owned and worked by Mr. Sandford, President of the Stamford Manufacturing Co., New York, and who, it is said, has amassed great wealth from his ownership of this mine, although the article which he produces is by no means of first-rate quality. At St. Louis, we understand there is no actual deposit or mine, but the mineral is found in boulders, and the farmers, on whose farms it turns up bring it to the mill, and are well paid for it, as it is of a very fine quality, and when manufactured, brings the highest prices. In Nova Scotia considerable Byrata is found, but owing to its colours, it can be used only for mixing with coloured paints, and consequently is not in much demand. In the Ottawa Valley, however, nine miles from the city, and within three or four miles of the steamboat landing on the Gatinean, it is said the largest and purest deposit of Baryta, yet discovered on this continent is to be found. Its location is in the township of Hull and is referred to in an official report of Sir Wm. Logan, made to the Government some years ago. From enquiries made, we learn that some 250 tons of ore from this mine have already been manufactured into white paint, equal to any lead, by the late Alex. Ramsay, of Montreal, and that he obtained first prize for it at the Centennial Exhibition at Philadelphia. It appears that, by means of a recent discovery in Scotland, patented there by the discoverer, and patented in Canada and the United States by Mr. Ramsay, Baryta is turned into excellent white paint, without a mixture of any *lead* whatever. We are informed that all the Admiralty ships are now painted with this material, and that it was for this mixture that Mr. Ramsay got the chief prize at Philadelphia. If this be so, and we do not doubt it, Byrata is destined to become an article of much usefulness and value, as, if found in the Ottawa Valley in sufficient quantity, it can be cheaply mined and manufactured, and the great expense of lead will be saved to the consumer. For this simple grinding of the article, we are told that Mr. Bonnyn, Hospital street, Montreal, has mills capable of grinding two tons an hour, and it might be well for such as have any of the "raw material" to communicate with that gentleman. It would be well, also, for such as may find traces of this mineral in their lands, to look closely after it; for though valuable enough *now*, to pay well for mining, there can be no doubt that in a short time it must become of much greater importance and value. Sulphate of Baryta is usually found in thin veins, from half an inch to two inches in width at the surface, and widening as it goes down; though to this rule there are exceptions, as in the case of the Hull mine, to which we have referred, a surface width of two to three feet is shown, widening rapidly as it descends. It is also found in pockets, and it is from such, that the Novia Scotia Barytes is taken, consequently the quantity is more uncertain and smaller, than when found in regular and well defined veins. It is invariably found with galena, but not in quantity to pay for working. The demand for Baryta is at present limited to about 1,200 to 1,400 tons per annum in Canada, but over the border, the demand is nearly unlimited, although the import duty almost prohibitory, viz:—half a cent a pound or ten dollars a ton. This is what has enabled the mine owners and grinders of it in the United States to make such large profits. The price in Boston and New York varies according to quality, some going as high as $50 a ton—but if Canada can produce an article of the highest grade, of which there is not the slightest doubt, it is evident, we can, even with the enormous duty exacted, still successfully compete with the English and German importers. We earnestly hope some of our enterprising capitalists will take this Baryta matter in hand; for besides the great general advantage of developing the latent and unproductive mineral wealth of the country, we are satisfied "there's millions in it" to those who are willing to invest a moderate amount of money, with a speedy return. We propose returning to this subject—meanwhile we will be glad to hear from any of our correspondents regarding Baryta.

MUSKOKA IMPROVEMENT COMPANY

A company has recently been organized amongst the lumbermen of Muskoka and Georgian Bay, for the purpose of regulating the driving and sorting of saw logs, constructing slides, booms, piers, dams, &c., on the Muskoka Rivers, the Severn, Musquash, &c. At a meeting which was held at Gravenhurst, the company was formed, and $50,000 capital subscribed. Messrs. H. H. Cook, Richard Power, A. P. Cockburn, M.P.; G. W. Taylor and Hon. Alexander Mackenzie were elected directors. The directors at a subsequent meeting, after electing Hon. Alex, Mackenzie president, prepared estimates of the proposed works and made arrangements for immediately commencing work upon the most urgent of these. A similar company, namely, "the Upper Ottawa, Improvement Co," has been in existence for some years, with a capital of $150,000. The directors are Messrs. Bronson, Perley, Eddy, Gordon and H. Robinson, H. Robinson, president, J. R. Booth, secretary, G. B. Green, acting secretary. The operations of this company extend from the Des Joachim to the foot of Hull Slide The organization has been found of great service to all parties engaged in lumbering on the Ottawa. The Muskoka Company will doubtless prove equally serviceable.

THE sale of "gold" bricks, made principally of brass, is brisk in the West. One corner is pure gold, and from it is clipped the sample to be essayed.

COAL OIL FIRE TEST,

The testing of coal oil has hitherto been a source of great annoyance to producers and consumers, owing to the uncertain results of the instruments used for making the tests. A very simple and complete instrument has just been perfected by Mr. M. Battle, Collector of Inland Revenue, Ottawa, which defines the flash test in a uniform manner on the automatic principle. Mr. Battle has paid great attention to the matter of testing oil, indeed the greater number of samples sent to the Department at Ottawa were submitted for his test and report. Yet he was frequently at a loss to obtain a uniform result, although he had the best instruments manufactured in the United States, Great Britain or the continent of Europe. His Improved Automatic Pyrometer however, combines uniformity of action, correctness of results, and simplicity of using. Nothing is required to be done by the testing officer or merchant, but to place a small quantity of oil in a cup, light a small lamp and watch two thermometers—one immersed in water, in a chamber underneath the oil and the other in the sample of oil to be tested. As the mercury rises to the testing point a double valve is opened by the party in charge, and if no gas or vapour is generated the light will continue to burn, and the oil is safe; but will be extinguished as soon as gas is evolved up to the number of degrees indicated, making the oil dangerous at that temperature. It is likely that that Mr. Battle's Pyrometer will be made the standard for the Dominion, and if so, it should supersede all others now in use, whether operated by electricity or otherwise.

THANKSGIVING.

It was our lot to be in the City of Belleville on Wednesday the 3rd inst., and considering that lumbermen and their representative connected with this journal had much to be thankful for, in common with the rest of the community, we went to hear the Rev. Mr. McLean, (Presbyterian) on that occasion. The rev. gentleman founded his remarks on Psalm 103, verse 2, "Bless the Lord, O my soul, and forget not all his benefits."

After referring to our deep obligations and many privileges, he said: It was cheering to think that the day had been set apart by the Government of our land for the observance of this sacred duty of thanks to God for his goodness to us as individuals and as a nation—cheering to think that our fellow subjects gather together to-day to acknowledge our common Father by the united recognition of his greatness and goodness throughout the land. The future of a land that thus recognizes its duty and privileges cannot be other than a great one.

It might be asked what are the reasons for thankfulness on our part. Are not the times dull? Do not many to-day feel that with the will to work, the opportunity is not afforded? Is it not a fact that our city is in a worse condition commercially, than it was in days gone by? While there is apparent ground for the spirit that is manifest in these questions, there may be, after all, reason for thankfulness in the very things complained of. Allow that our city has been in a bad condition in a business point of view for some time back; whose is the fault? To the best of my belief it lies at our own door. We have been going on too fast in one way and too slow in another. We have been overcrowding our different branches of commerce. For example, there have been too many young men, who, under the delusion that they were heaven-born merchants—have forsaken the sure, if slow, returns of farming life, for the swift but uncertain gains of merchandise. The result has been, as might be anticipated—many of these have come to ruin, and have been taught by a bitter experience, that it really does need, at least, a modicum of training to succeed in any business or profession, in those days.

Again, merchants have been speculating too strongly on the likelihood of large sales, and, disappointed in their expectations, have been unable to meet their liabilities. Retrenchment has become the order of the day, of necessity. If these opinions are correct, then one great cause of present depression has been in overdoing things, and one result of the reaction will probably be a healthier commercial life in the future.

The same remarks as to extravagance may apply to general living in the past of the people themselves. The love of display among all classes of the community, has doubtless had much to do in lessening ability to meet engagements. The only cure for such a course is to live within one's income. Here again is one benefit that may accrue from the general stagnation that is complained of.

We certainly have to thank God for all the benefits He has conferred upon us. The common blessings of the earth such as air, sunshine, water, and harvests; each is needful for our well-being, and each given in all fulness. The preservation of our bodies, in all their senses, organs and faculties, so as not merely to enjoy life, but also to be serviceable—health and strength to do work and provide for families. All these are bestowed on us.

Living in a land of freedom, with wise laws honorably upheld, with property and life properly protected; with fair prospects for all who are willing to work; with a law-abiding, moral-living community, where lawlessness and crime are swiftly punished, and justice meted out to all—surely one ought to thank God for those benefits in these regards. Our harvest is plentiful, God has blessed the labours of the husbandman. No heavy floods "have disappointed his hopes, and sent dismay through the land." No bitter frosts have killed the ripening grain. For one grain sown, many are given back. He on whom we are dependent for rain and sunshine and fruitful seasons has again opened his hand and filled our barns with plenty.

And do we not see indications throughout the land of the return of cheerier times in the apparent growing briskness of business—of times when he who desires it may have work at home in plenty. Is it not a matter of thankfulness that in this Dominion of ours there is room and scope for all. That whosoever is able and willing to labour may find in it the place and the opportunity.

The Rev. gentleman concluded his excellent discourse with many practical and suitable lessons, bearing on "the life that now is, and the life that is to come."

A New Brunswick journalist displays a thankful spirit as follows:—It is very gratifying to know that there has been a vast increase of Inter-Colonial trade, as evidenced by the remarkable increase of traffic on the Government railways this year. Our exports, too, have been in great demand—our lumber (both in the United States and Britain), our grains, our cattle, the produce of the dairy and the orchard. We have to be thankful, too, for the remarkably favourable weather which has distinguished the season of 1880, weather so favourable for the full pursuit of the occupations of the industrial classes that we can scarcely hope to see it duplicated in 1881. We should also give thanks for freedom from epidemics and pestilences and tidal waves of crime and violence. We have to be thankful for the steady progress of education and temperance, the increa z [illegible] of the people in support of churches and Sunday schools. Among other causes for thankfulness may be cited the fact that Canada is regaining its old prosperity under the political leadership of the first Canadian of his generation, Sir John A. Macdonald; that the negotiations for reducing the public burthens by turning the building of the Pacific Railway over to a private company have been successful; and that the people of Canada have almost universally accepted the National Policy as the Tariff policy of the country. In our immediate neighbourhood there is cause for thankfulness in the increased trade which has sprung up; the hopeful spirit which has succeeded the feeling of despair which had taken possession of too many of our citizens; and in the evidences of "the good time coming" which are apparent to many amongst us. We may indeed be thankful with our lot when contrasted with the circumstances of the people of most other countries; and while grateful to an all wise Providence for the many blessings vouchsafed to us, let us resolve to do the very best for ourselves that lies within our power.

LETTER FROM QUEBEC.

THE END OF THE SEASON—LOADING THE LAST SHIP — LARGE TRANSACTIONS — PRICES, ETC.—THE PRINCIPAL OPERATORS IN OAK —LOGS — COMPARATIVE STATEMENT — MINING NOTES.

QUEBEC, Nov. 8th.

Before my next letter is addressed to the LUMBERMAN, it is probable that this port will be completely closed for the season to navigation. Ten days hence, and sea-going ships remaining here, will find it hard enough to reach the ocean. There are seven or eight timber vessels loading here, but all hope to be away within a week from this date.

It must be gratifying to producers and their friends to know that so small a stock of lumber will be locked up here for the winter. On a carefully prepared calculation, I find that there is now next to nothing held here in first hands.

During the present season, some twelve to fifteen cargoes of deals have been purchased and shipped home by Messrs. Bryant, Powis & Bryant, of London. Mr. H. W. Powis, a member of this firm, and a gentleman well known in Quebec, has spent the greater portion of the summer on this side the Atlantic, making purchases and shipping home his stock.

Very little business was done in Lower Town last week, the time being cut up by a couple of holidays.

WHITE PINE.

With the exception of small lots sold for local consumption, at 14 and 17 cents, no white pine has changed hands since my last letter. A small raft or two now remaining are held firmly at high prices. There is a good deal of inquiry for Waney Board, but no lots are at present offering.

DEALS.

There is but little change since my last letter to report, either in pine or spruce deals. Prices remain about the same with a tendency to a slight increase, owing to unsupplied demands.

OAK.

In previous letters, details have been given of several contracts for oak made this autumn for future delivery. Quantities and prices have been furnished. The contracting producers are principally Calvin & Co., Kingston, Neilon & Co., D. B. Charleson, Sarnia, D. C. Thompson, Quebec, and Mr. McCrea.

PRICES.

Oak, Ohio, 65 feet average as been sold as under within the last fortnight: By Calvin & Co., 50,000 feet at 50 cents; by Neilon & Co., 100,000 feet at 47 cents.

A raft of the same quality and average as the above, now in Montreal and to arrive, containing 30,000 feet, together with 15,000 to winter at Garden Island, have been sold by Calvin & Co. at 52 cents. This is believed to be the highest figure obtained. Of 63 feet average, 50,000 feet have been sold at 49 cents.

Michigan oak, 65 feet average. One lot has been sold by Mr. D. C. Thompson at 49 cents.

Canada oak remains unchanged.

Ohio and Michigan are still sought for next year's delivery.

Staves are scarce and in demand.

Elm and ash are in demand, particularly the latter.

In birch there is little doing, and the quantity on hand is not much reduced by late shipments.

FOR THE SHANTIES.

More shantymen have been dispatched to the woods since the date of my last letter. Nearly forty leave for the West by G.T.R.R. this evening, mostly for Toledo. Men are now very scarce here, and wages have again been reduced. It is not probable that more than one other batch will be made up in Quebec this fall.

COMPARATIVE STATEMENT.

In reviewing the business of the year and comparing it with that done in 1878-79, the following comparative statement of timber, masts, bowsprits, spars, staves, &c., measured and culled to date, by cullers attached to the supervisor's office, should prove of interest to readers of the LUMBERMAN:—

	1878	1879	1880
Waney White Pine	1,846,640	1,599,273	2,193,367
White Pine	7,917.756	2.507,729	4,216,263
Red Pine	1,359,756	741,499	7,020,364
Oak	1,516,223	835,993	1,567,644
Elm	177,653	336,461	932,950
Ash	36,597	47,161	238.461
Basswood	923	280	363
Butternut	39	70	645
Tamarac	29,306	6,691	30,889
Birch and Maple	180,416	121,224	575,464
Masts and Bowsprits	93 pcs	50 pcs	4 pcs
Spars	42 pcs	26 pcs	23 pcs
Std. Staves	299.3.1.8	178.5.3.7	195.7.1.1
W. I. Staves	564.1.3.9	169.2.2.26	487.7.0.8
Brl: Staves	.....	.....	10.8.2.10

WM. QUINN,
Supervisor.

Quebec, 5th Nov., 1880.

LOGS.

Messrs. King Bros. have given the contract for the cutting of 4,000 logs during the winter at St. Jean Deschaillons in this Province. Forty men with ten teams of horses, have also left for Pabos, Bail des Chaleurs, to cut 70,000 logs for the Messrs. King. Messrs. G. B. Hall & Co. lost a large quantity of logs a few days ago, by the breaking of their booms at the Chaudiere.

MINING NOTES.

It has been frequently asserted, and almost as frequently denied, that there are distinct indications to be seen of the existence of beds of coal in various parts of this Province. This week I have been shown a specimen from Lake St. John of what certainly looks very much like soft coal. Specimens of the article known in England as Cannel coal, or of something very akin to it, have frequently been brought to this city from parts of Montenaquy. I wonder that the Dominion Geological Survey has not ere this undertaken to prove the character of the supposed mineral,

From all that can be gathered, unusual activity will be the order of the day next Spring in the coal regions of Beauce. Heretofore miners have been content with the alluvial workings, and the large yields of the precious metal already reported from the Chaudiere Valley, have all been obtained by the washing of the sand. Preparations are now being made for the erection of mills to crush the quartz, and quantities of the most expensive and improved machinery applicable for the purpose are now being shipped to the diggings by Levis & Kennebec R. R.

STADACONA.

Special Telegram per Montreal Line:—

QUEBEC, Nov. 10.

Since mailing letter, it is reported E. H. Richer, St. Hyacinthe, has been authorized by French manufacturers to purchase for shipment as much white birch (Bonleau) as possible. No particulars as to size or for what required. Bonleau is very common in the province and much used for firewood.

Messrs. Allan, Gilmour & Co. of this city have sold the bright pine deals to be sawn at their mills next season. Prices were $112 to $115—$76 and $40 free on board for first, second, and third qualities.

The Eureka Consolidated mine yielded last year, according to the official returns, $2 358,518 in refined bullion and lead, $380,000 was paid in dividends during the year, and the amount of cash on hand, October 9th 1880, was $24,521.

Hardwood Timber Land for Sale.

FOR SALE, 1200 ACRES HARDWOOD timber land near Nipissing Railway, Coboconk. Easy terms: OSHAWA CABINET CO., Oshawa.

Timber Limits for Sale.

SEVERAL MOST VALUABLE TIMBER limits on North Shore of Lake Huron. For particulars apply to

THOS. SHORTIES,
Imperial Bank Building, Toronto.

FOR SALE, AT A GREAT BARgain, 320 acres of excellent farming land, heavily timbered, and well watered by a branch of the Pigeon River, in Cheboygan Co. Michigan. Apply to the Editor of the CANADA LUMBERMAN. 1-tf.

REID & CO., WHOLESALE LUMBER DEALERS. Lumber, lath, shingles, &c. Car lots to suit customers. Best culls in the market for from $6 to $7 per M.

OFFICE ON DOCK—Esplanade, foot of Sherbourne Street, Toronto. 2in

MACHINERY!

STEARN'S No. 3 SAW MILL Log Turner, 68 h.p. Engine, 3 Boilers, dome and heater. This is first class mill outfit, held for a bank and will be so'd cheap. We have also 2 Iron Lathes and other Machinery. Send for Price List.

WM. DINGMAN & CO.,
56 Front Street East, Toronto.

LAUDER & THORNTON MFG. CO.,
MANUFACTURERS OF

Steam Gauges, Vacuum Gauges

ENGINEERS' & PLUMBERS' BRASS GOODS, &c.

98 Adelaide Street East, Toronto.

Steam Gauges correctly tested and repaired. 2-5in

FILES RE-CUT!

THOMAS GRAHAM,

File Works, 35 Sherbourne Street, Toronto, Ont.

Old Files reground and re-cut equal to new for use. During the past year I have re-cut nearly 3,000 dozen of old files for mill owners and others in Ontario and Quebec. Prices—per dozen for Mill Files, 8 in. $1.50; 10 in. $2; 12 in. $2 75; 14 in. 3.75. Other kinds *pro rata*. Quotations from these rates to large consumers.

THE

Intercolonial Coal Mining Co.,

offer their fresh mineral bituminous Coal from their

DRUMMOND COLLIERY.

F.O.B cars, deliverable at stations of the Intercolonial and Grand Trunk Railway.

Apply to

Intercolonial Coal Mining Co.,
26 St. Francois Xavier Street,
MONTREAL.

The coal is now being received at Toronto by several of the dealers—W. J. Keith, C. J. Smith and others.

Notice to Contractors.

SEALED TENDERS, ADDRESSED TO the undersigned, and endorsed "Tender for Owen Sound Works," will be received until Friday, the 19th November, for the execution of Works for the improvement of the Harbour of Owen Sound, according to a plan and specification to be seen on application at the office of the River and Harbour Commissioners, Owen Sound, and at the Public Works Department, Ottawa, where Forms of Tender can be obtained.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures.

Each tender must be accompanied by an *accepted* bank cheque, *equal to five per cent*, of the amount of the tender, which will be forfeited if the party declines to enter into a contract when called on to do so, or if he fails to complete the work contracted for. If the tender is not accepted, the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By order,

S. CHAPLEAU,
Secretary.

Department of Public Works,
Ottawa, Oct. 28th, 1880.

JOHN McGREGOR & SONS,

MANUFACTURERS OF ALL KINDS OF

STATIONARY,
MARINE, and
LOCOMOTIVE BOILERS,
and SHEET IRON WORK.

Portable Boilers for Threshing Machines, Shingle Mills, etc,, furnished on short notice. All Boilers tested by cold water pressure to 150 lbs. to the square inch before leaving the shop.

SECOND-HAND MACHINERY

bought, sold, or taken in exchange for new work.

REPAIRS PROMPTLY ATTENDED TO

183 Atwater St., Detroit. Michigan.

BRANCH SHOP—

Cor. Glengarry Ave. & Stuart st.,
WINDSOR, ONTARIO.

THE ECONOMIST

Financial, Railway and Mining Journal.

BOSTON. PUBLISHED WEEKLY. NEW YORK.

$3 00 a Year. 10 Cents a Copy.

THE ECONOMIST IS DEVOTED exclusively to the Financial, Railway, and Mining Interests of the United States. It is the representative journal of its class in New England, and has, by its conservative and independent policy, established a reputation and circulation which give it a commanding influence in its section. It aims to advance and protect the legitimate mining industry, and to guard investors from imposition and consequent losses.

THE ECONOMIST presents special inducements to advertisers through which to reach the wealthy classes of New England. Its circulation among the Mining States and Territories is large and rapidly increasing.

Specimen copies free.

R. F. STRAINE, Business Manager.
31 Milk street, Boston
New York Office: 115 Broadway.

ST. LAWRENCE HALL.

PORT HOPE.

Is noted for its superior home-like comforts—a well kept table, equalling the best Hotels in Toronto, and large, well-furnished rooms. Good sample rooms on ground floor. Walton Street, Port Hope

Wm. MACKIE, Proprietor.

ALLANDALE JUNCTION HOTEL.

Travellers by Northern Railway have 15 to 20 minutes by all trains, for refreshments. Solid meals Tea and coffee at counter. Fine brands of liquors and choice cigars.

E. S. MEEKING Proprietor

FRASER'S HOTEL.

GRAVENHURST, ONT.

HENRY FRASER, proprietor (successor to Dougland Brown.) Mr. Fraser having purchased and thoroughly renovated and refitted that old established hotel, so long and popularly kept and owned by Dougald Brown, in the village of Gravenhurst, is now in a position to attend to the wants of the travelling and general public. Parties *en route* to the Muskoka District, will find "Fraser's" a comfortable stopping place. The Bar and Larder are well furnished. Convenient Sample Rooms for Commercial Men. Good Stabling and attentive hostler. Free 'bus to and from trains and steamboats.

ST. LOUIS HOTEL.

THE RUSSELL HOTEL CO., Proprietors.

WILLIS RUSSELL, Pres., Quebec.

This hotel, which is unrivalled for size, style and locality in Quebec, is open throughout the year for pleasure and business travel.

HOTEL OTTAWA,

No. 21 North Side King Square.

ST. JOHN, N. B.

E. COSMAN, - - Proprietor.

Terms, $1.00 to $1.50 per day.

THE RUSSELL HOUSE,

OTTAWA,

JAS. A. GOUIN, - - Proprietor.

IS THE

Favourite Resort of the Leading Public men of the Dominion attending the annual Sessions of Parliament.

Ministers of the Crown, Senators, Members of Parliament, Public Officials, as well as those having business with the various Departments of the Government. It is also the head-quarters of those having dealings with the princely Lumber Manufacturers in the great Pine Valley, of which Ottawa is the acknowledged centre.

THE RUSSELL HOUSE being central, almost abutting on the magnificent PARLIAMENT and DEPARTMENTAL BUILDINGS—the pride of the Country—is thus conveniently situated for those visiting the City on public business. But the location is also everything that could be desired alike for the man of business and the man of pleasure. A few minutes walk brings the guest of the Hotel within reach, not only of all the principal business resorts, but also of the most splendid Mountain and Valley Scenery that can be seen anywhere, as also of the two almost unrivalled Waterfalls—the Chaudiere and Rideau—and of the extensive Manufacturing Establishments and Depots of the leading Lumbermen. But, besides the beautiful scenery, which, it may be mentioned, includes the magnificent Ottawa and two of its grand tributaries—the Rideau and the Gatineau—there are in the immediate neighborhood, beautiful Lakes and apparently never-ending woods, which afford opportunities for the finest Fishing and Shooting that can be obtained on the Continent.

THE RUSSELL HOUSE affords excellent accomodation for 300 guests; its table is abundantly supplied with Viands of the choicest description, in season, and nothing is left undone to make every visitor feel comfortably "at home."

☞ Omnibusses meet the Arrival of every Train and Boat.

A Pointed Reminder.

A party of adventurous lads, myself among the number, were out for a glorious holiday. Each had his canvas bag across his shoulder, and we stole along the stone wall yonder, and entered the woods beneath that group of chestnuts. Two of us acted as outposts on picket guard, and another, young Teddy Shoopegg by name, the best climber in the village, did the shaking. There were five busy pairs of hands beneath these trees, I can tell you, for each one of us fully realized the necessity of making the most of his time, not knowing how soon the warning cry from our outposts might put us all to headlong flight, for the alarm, "Turner's coming!" was enough to lift the hair of any boy in town.

But luck seemed to favour us on that day. We "cleaned out" six big chestnut-trees, and then turned our attention to the hickories. There was a splendid tall shagbark close by, with branches fairly loaded with the white nuts in their open shucks. They were all ready to drop, and when the shaking once commenced, the nuts came down like a shower of hail, bounding from the rocks, rattling among the dry leaves, and keeping up a clatter all around. We scrambled on all fours, and gathered them by quarts and quarts. There was no need of poking over the leaves for them, the ground was covered with their bleached shells, all in plain sight. While busily engaged, we noticed an ominous lull among the branches overhead.

"'Sst! 'sst!" whispered Shoopegg up above; "I see old Turner on his white horse daown the road yender."

"Coming this way?" also in a whisper, from below.

"I dunno yit, but I jest guess you'd better be gittin' reddy to leg it, fer he's hitchin' his old nag't the side o' the road. *Yis*, sir, I bleeve he's a-cummin'. Shoopegg, you'd better be gittin' aout o' this," and he commenced to drop hap-hazard from his lofty perch. In a moment, however, he seemed to change his mind, and paused, once more upon the watch. "Say, fellers," he again broke in, as we were preparing for a retreat, "he's gone off to'rd the cedars; he ain't cummin' this way at *all*." So he again ascended into the tree-top, and finished his shaking in peace, and we our picking also. There was still another tree, with elegant large nuts, that we had all concluded to "finish up on." It would not do to leave it. They were the largest and thinnest-shelled nuts in town, and there were over a bushel in sight on the branch tips. Shoopegg was up among them in two minutes, and they were showered down in torrents as before. And what splendid, perfect nuts they were! We bagged them with eager hands, picked the ground all clean, and with jolly chuckles at our luck were just about thinking of starting for home with our well-rounded sacks when a change came o'er the spirit of our dreams. There was a suspicious noise in the shrubbery near by, and in a moment more we heard our doom.

"Jest yeu look *eeah*, yeu boys," exclaimed a high-pitched voice from the neighbouring shrubbery, accompanied by the form of Deacon Turner, approaching at a brisk pace, hardly thirty feet away. "Don't yeu think yeu've got jest abaout *enuff* o' them nuts?"

Of course a wild panic ensued, in which we made for the bags and dear life, but Turner was prepared and ready for the emergency, and raising a huge old shot-gun, he leveled it, and yelled, "Don't any on ye stir ner move, or by Christopher I'll blow the heads clean off'n the hull pile on ye. I'd shoot ye quicker'n lightnin'."

And we believed him, for his aim was true, and his whole expression was not that of a man who was trifling. I never shall forget the uncomfortable sensation that I experienced as I looked into the muzzle of that double-barrelled shot-gun, and saw both hammers fully raised too, And I can see now the squint and the glaring eye that glanced along those barrels. There was a wonderful persuasive power lurking in those horizontal tubes; so I hastened to inform the deacon that we were "not going to run"

"Wa'al," he drawled, "it looked a leetle thet *way*, I thort, a spell *ago*;" and he still kept us in the field of his weapon, till at length I exclaimed, in desperation.

"Point that gun in some other way, will you?"

"Wa'al, *no!* I'm not fer pintin' it enny whar else jest *yit*—not until you've sot them ar *bags* daown agin, jist whar ye *got* 'em, every *one* on ye." The bags were speedily replaced, and he slowly lowered his gun.

"Wa'al, naow," he continued, as he came up in our midst, "this is putty bizniss, *ain't* it? Bin havin' a putty lively sort o' time teu, I sh'd jedge from the looks o' these 'ere *bags*. One—two—*six* on 'em; an I vaow they must be nigh on teu two an' a half bushel in every pleggy *one* on 'em. Wa'al, naow"—with his peculiar drawl—"look eeah: you're a putty ondustrious lot o' *thieves*, I'm *blest* if ye ain't." But the deacon did all the talking, for his manœuvres were such as to render us speechless. "Putty likely place teu cum a-nuttin', ain't it?" Pause. "Putty nice mess o' shellbarks ye got thar, I tell ye. Quite a sight o' *chestnuts in yourn*, ain't they?"

There was only one spoken side to this dialogue, but the pauses were eloquent on both sides, and we boys kept up a deal of tall thinking as we watched the deacon alternate his glib remarks by the gradual removal of the bags to the foot of a neighbouring tree: This done, he seated himself upon a rock beside them.

"*Thar*," he exclaimed, removing his tall hat and wiping his white-fringed forehead with a red bandana handkerchief. "I'm much *obleeged*. I've been a-watchin' on ye gittin' these 'ere nuts the hull arternoon. I thort ez haow yeu might like to know it." And then, as though a happy thought had struck him, what should he do but deliberately spit on his hands and grasp his gun. "Look *eeah*"—a pause, in which he cocked both barrels—"yeu boys wuz paowerful anxyis teu git *away* from eeah a spell ago. Naow yeu kin *git* ez lively ez yeu please. I hain't got nothin' more fer ye teu deu today." And bang! went one of the gun-barrels directly over our heads.

We *got*, and when once out of gun range we paid the deacon a wealth of those rare compliments for both eye and ear that always swell the boy's vocabulary.—From "An Autumn Pastoral," by WILLIAM H. GIBSON, in *Harper's Magazine for November*.

Midnight Oil.

To the student, night reading is the most congenial, the most satisfying—and, we are bound to add, the most injurious. By tradition, your true bookworm burrows deepest at night. Perhaps the essayist was right when he exclaimed, "There is absolutely no such thing as reading but by a candle." Had he tried the perusal of a book at noon-day, and found it labour thrown away?

"Whence is thy learning? Hath thy toil
O'er books consumed the midnight oil?"

There is at least a grain of logic in the tradition, for, supposing the author to have given his thoughts expression by the light of the taper, it is no more than consistent to believe that we ought to approach their perusal by the same light, "if we would catch the flame, the odour." Moore, enraptured of the young May moon, gave it out that the best of all ways to lengthen our days is to steal a few hours from the night. But pilfering of this kind is, as we have said, injurious to health. Leigh Hunt was right when he said that sleep is best before midnight. He who burns the midnight oil is rarely one who rises with the lark, and lying late in the morning is never found in company with longevity. Besides it tends to create corpulence. Weak eyes and weary heads likewise follow nocturnal indulgences such as are the delight of a student. But remonstrances, forsooth, avail little. There is a fascination about midnight study and midnight composition more potent than the alarmist's notes of warning, and authors and students will probably continue to yield to its spell until authors and students are no more.

It is probable that the scheme which was proposed first by Mr. Shaw Lefevre, and which has been advocated by Mr. Bright, will form the basis of the contemplated settlement of the Irish land question by the present English Government. All landowners ready to sell will be given debentures bearing three per cent. for their property. There tenants will be charged four per cent. during a term of years—three per cent. being to pay interest on the debentures, and one per cent. to act as a sinking fund, so that at the end of the term the land will become the property of the occupier. In addition to this, large tracts of waste lands will be bought and let in lots of thirty or forty taces to peasants, and these lots will become hur property of the peasants after a certain nember of payments.

Under an Umbrella.

One day the duc de Berri happened to be taking a walk in Paris with his wife, and they were returning toward the Elysee when a heavy rain-shower came on. The two promenaders, being unprovided with umbrellas, took refuge under a *porte cochere* already tenanted by a young man with the appearance of a clerk, who had an umbrella. When the storm had somewhat abated, the duc de Berri stepped up to the young fellow and asked whether he would mind lending the umbrella to enable him—the duc—to take his wife home. The other was suspicious and decidedly objected to parting with his property on any conditions. The duc persisted, but finding that there were no hopes of obtaining a loan of the coveted object, he asked its owner whether, though not having sufficient confidence in him to lend it, he would mind offering the lady his arm as far as her residence. The gallant young clerk willingly agreed to do so, and off the duchess and her escort accordingly started. The latter individual, very garrulous by nature, soon opened a conversation by the query as to whether his companion lived in the quarter they were then in. "Quite close to here," replied the duchess. "It is a splendid quarter, madame, plenty of luxury and very *comme il faut*. In fact, it is the *grandes dames'* quarter, with nothing but duchesses and marquises in it, with their dresses all worked in gold." "Quite so.' "I don't know whether madame has noticed the fact, but generally the less elevated a person's grade of nobility the higher the floor he or she occupies." "There is some truth in that," gravely responded the duchess.

"For instance," pursued the theorizer, "you will usually find viscountesses and baronesses on the fourth floor, and if madame happened to be a viscountess I would wager that I know the floor on which she lives—the fourth, that is"—"Not low enough, sir!" said the lady. "Oh, well, then, madame is very likely a comtesse?" "Lower still," observed his companion. "Indeed!" madame must be a marquise, then?" "My floor is lower yet," replied the duchess, who had found it very difficult to avoid laughing outright. Just at this moment they arrived at the Elysee, the guard, of course, presenting arms in due form. The proprietor of the umbrella felt inclined to shrink into himself, and was beginning to stammer out some excuse when the duchess cut him short by thanking him very heartily for the services he had done her, and stating that she would not forget it. The young fellow returned to his employer, a wealthy man of business, and recounted his adventure, not quite recovering from the, to him, unaccustomed effect of the society of a duchess for the remainder of the day. Before the expiration of a week he received from his quondam acquaintance of the Elysee an umbrella richly adorned with silver.

Less Anxious to Fight a Duel.

(From the New York Times.

The lie passed between Wolf von Scheirbrand, one of the reporters, and Gallus Toman, the assistant editor of the *Frie Presse*, of Brooklyn, and the former sent the latter a challenge to mortal combat. Von Scheirbrand was once in Kaiser Wilhelm's army, and is said to be of noble lineage. Toman is a Greek; he speaks five languages with ease, saw service in the union army during the rebellion, and is said to be an adept with pistols. The law reporter of the same journal, Sigismund Kander, was called to be second to Mr. Toman. and he conveyed to the German his principal's acceptance of the challenge. The terms of the match, as fixed upon by the challenged party, were pistols, three shots, the first at fifteen paces, the second at ten, and the third at five, the man who retreated before the programme was carried out to be posted as a coward. Von Scheirbrand jumped at these terms and wanted to fight forthwith. He purchased a pistol, sent his wife to Pennsylvania, and settled his affairs. A hitch occurred. Mr. Toman's second insisted on delaying the duel until some convenient spot might be found where the principals might have their fun without interference. The German swore Toman was a coward, and refused to delay an hour. Thus the matter stands. Scheirbrand's pistol is loaded, primed, and ready, like its owner, for immediate action. Toman has not yet found the convenient spot, disinterested persons say he has not yet neglected his editorial duties in the search. Chief of Police Campbell does not place so much confidence in the determination of either of the gentlemen to fight to consult council as to whether he is empowered to act in the matter.

Lost Explorers.

COMMANDER CHEYNE ON THE TRUE CAUSE OF THE ANNIHILATION OF FRANKLIN'S EXPEDITION.

Commander Cheyne has written the following to the New York *Herald*:

Franklin's companies were starved to death by the contractor who supplied preserved meats—or, rather, preserved filth—to the Erebus and Terror. This statement I make upon clear and undeniable grounds, as follows: The contractor who supplied Sir John Franklin's expedition also supplied the first searching expedition under Sir James Clarke Ross with preserved meats. What was our experience? In very many instances eight-pound tins labeled "roast beef" and "roast mutton" were found to contain nothing b t bones. Meat tins contained rotten vegetables, but never the reverse. The public will hardly credit the statement when I say that the whole of the animals were preserved in tins excepting the horns, hoofs and hides; the very entrails and contents were preserved for our subsistence during an arctic voyage, when no other provisions could be procur ble. Often were we, in the midshipmen's mess of her majesty's ship Enterprise, compelled to hold our noses while we ate our dinners, so great was the stench, and often also, when the daily rations served out were taken on the quarter-deck for survey and condemnation, Sir James Ross' answer would be, "If I condemn those I might condemn half the provisions in the ship and then we should simply starve."

As one of the victims of that contractor's greed for money I feel the necessity of making these facts public. Now, what happened on board her majesty's ship Plover, another arctic ship sent in search of Franklin? On one day, in the arctic regions, 10,570 pounds weight of preserved meats from the same contractor were found to be in a pulpy, putrid state, and were condemned and thrown overboard as unfit for food. What happened at Malta and Deptford? Let others supplement this letter by details of the survey held upon his abominable meats at those places. What large quantities of his provisions were thrown overboard from her majesty's ship Herald in the arctic regions, doubtless Capt. Bedford Prim can and will disclose. Sufficient for me to say that, when serving in her majesty's ship Resolute on Capt. Austin's expedition, my eyes lighted upon this contractor's name on the empty tins lying about the beach at Beechy island, the first winter quarters of Franklin. I knew at once that starvation must have done its work and that Franklin's party fell victims, not to the severity of an arctic climate, but to this man's cupidity. Thank God the remains of Lieut. Irving, one of Franklin's officers, as known by a Royal Naval college medal found in his open grave, have been brought away by Lieut. Schwatka, commanding the American searching expedition, so that I trust a thorough investigation of all the circumstances will be demanded by the public, if only in common gratitude to those brave men who fell, one by one, in the service of their country.

Kind Heartedness.

It is a great blessing to be kind hearted and to be actuated by a desire to be of service to your fellow creatures. If you have the will to confer a favour or to make some one happy the opportunity will not long be wanting. The changes of fortune in this lower world are so frequent that the time is sure to come when you can accommodate your neighbour, and all this without serious inconvenience to yourself. For instance:—A German gentleman with slender means said to his neighbour, the Herr Baron, who lived in a fine house on the other side of the avenue, "My dear Baron, my daughter is to be married next week and I have come to ask if you will kindly lend us your equipage to take us to the church." The Herr Baron was not only kind hearted, but also very discriminating in his favours, so he replied, "My good friend I shall always be delighted when I can be of any service to you. My horses, however, are very large and stately, and I have noticed that people always drive very fast to and from a wedding. You will therefore excuse me if I refuse. But," and here he became very confidential, "if it should so happen at any time in the future that you need my horses to attend the funeral of any member of your family I shall lend to you with the greatest of pleasure."

The Irish Troubles.

It is sad to think of the misery endured by the Irish people for many generations, and sadder still to think that, after all that has been done to mitigate or remove the evil under which they labour, they are, to-day, in as deplorable a state as they ever were. Of course, we know it is the fashion of the time to lay the responsibility of all this on the land system of the country. It is not Parnell and his co-agitators alone who charge the sin of all this suffering on the landlords. Ever and anon we find the same sentiment cropping up in leading articles and paragraphs, in both American and Canadian newspapers. But the land system in Ireland, whatever may be its faults, is substantially the same as that which exists both in England and Scotland; and yet, neither of these have been kept in the chronic state of discontent and rebellion which has, unhappily, so long existed in the Island of the Saints. There is not so much dissimilarity in these countries, that we should not expect the same causes to produce the same effects in them all. But, while England and Scotland have enjoyed a large measure of prosperity and contentment, Ireland has had neither. Her people, as a rule, have been miserably poor; in fact, so much so as to be frequently on the verge of actual starvation, from which they have only been kept by the charity of others.

We are told, however, that the landlords in Ireland are not Irishmen; that they were not the original owners of the soil; that they got the land into their possession by confiscation and spoliation; and that they were placed over the Irish people for the purpose of alienating them from the Catholic faith and making Protestants of them. All this may be substantially true; and there may be a great deal in these facts to make the blood of the patriotic Irish student of history boil in his veins; but, after all, the events of three centuries ago can scarcely account for the misery of to-day. The landlords of England are not Englishmen. The followers of William the Conqueror who divided the country among them, and made slaves of the people, did not prevent England from rising. The Norman is the owner of the land to-day, but the Saxon and the Celt, whom he reduced to serfdom, eight hundred years ago, shows more largely than he does to-day both in wealth and political power. It is true that in England we do occasionally hear something about the tenure of land; but it is generally discussed in a calm and philosophical spirit; and, though there are political and social philosophers who believe the English land system ought to be reformed, nobody clamours for the summary ejectment of the landlords as a means of curing either the real or imaginary ills of the country.

The question with which we are brought face to face in this agitation which is going on in Ireland at the present time is, whether there is any such thing as property in land? And, if so, has the owner of the land a right to deal with it just as with any other sort of property; does the doctrine of Free Trade, which is, that every man has a right to buy in the cheapest market and to sell in the dearest, apply to this as well as to everything else? These are questions, however, which we do not propose at present to discuss. Assuming that the gigantic act of spoliation which, apparently, the Irish Land League is seeking to bring about, had become an accomplished fact; and that every landlord in Ireland was sent packing, would that make the Irish a prosperous, contented, and happy people? Could the little farmer, with his miserable patch of ground—often not more than an acre or two—even though he owned it, in fee simple, ever be anything but miserably poor? After all the nonsense which has been talked and written about the eviction of tenants, the fact is, that in nine cases out of ten, we suspect their forcible removal from the overburdened soil, which is no longer able to sustain them, would be the very best thing that could be done for them. One of two things is essential to the prosperity of Ireland, either that it be relieved of its surplus population, or that industries be started on a sufficient scale to give employment to the millions who cannot find it in the cultivation of the land. No country can ever be prosperous that depends upon the cultivation of the land alone. If manufactures had been fostered in Ireland as they have been in England and Scotland the probability is that it would have been in a very different position from what it is to-day.

As to the land agitation with all its revolting attendants of murder and arson, and every other form of outrage, whatever may be its immediate result, we are satisfied it will afford no considerable measure of permanent relief. Poor Ireland has suffered much from many physicians already, and we fear there is now suffering in store for her under the unskilful and blundering treatment of Parnell, Dillon and Co. Every lover of humanity will hope and pray that the evils with which she is threatened may be avoided, but it must be confessed the outlook at present is gloomy and distressing.

USEFUL RECEIPTS.

If brooms are wet in boiling suds once a week they will become very tough, will not cut a carpet, will last much longer, and always sweep like a new broom.

Cocoanut Pound Cake.—One pound of cocoanut grated; one pound of white sugar, one-fourth pound butter, six eggs, six tablespoonfuls of sifted flour, and one glass of brandy.

Yeast.—Boil a handful of hops, tied in a thin cloth, in a gallon of water for half an hour; then take them out and add to the water in which they were boiled, four grated potatoes, two large spoonfuls of salt and the same quantity of sugar stirred together in about a pint of cold water. Boil ten or fifteen minutes, or until the potatoes are done. When partly cold add some yeast to start it.

Cocoanut Pudding.—Take half a pound dessicated cocoanuts and two thick slices of bread; put them to soak in a quart of milk for two or three hours; then add an ounce of butter, two ounces of sugar, the yolks of four eggs, and a saltspoonful of salt; beat the whites to a stiff froth; add them to your pudding, and bake in a hot oven for three-quarters of an hour. Serve hot.

Angel's Food.—Take half a box of gelatine and one pint of milk, and put it on the fire, and, when the gelatine is entirely dissolved, add the yolks of three eggs, well beaten, and four tablespoonfuls of white sugar; let it boil a few minutes, then remove from the fire and stir in lightly the whites, beaten to a stiff froth. Flavor with vanilla, and pour into molds to cool.

Sponge-cake.—Twelve eggs, their weight in granulated sugar, and the same of flour. Beat the yolks of the eggs and the sugar well together; beat the whites to a stiff froth; sift the flour very lightly; add a teaspoonful of the beaten white of egg and one of the flour alternately till all is used; then add the grated rind and juice of a lemon. Put a well-greased paper in a tin baking-pan and bake the cake in it in a very hot oven; if it is getting too brown on top, cover with a piece of letter paper.

Tea Rolls.—Half a cake of compressed yeast in three half-pints of lukewarm water; add a quart of sifted flour, and mix well to a thick batter. Let it stand six or seven hours in a moderately warm place till well risen. Then add two eggs, an ounce of butter, four ounces of sugar, and a tablespoonful of salt; add flour, (about a pint,) and work well with hands till it is a soft dough. Make into rolls; put them in the pans they are to be baked in, and set near the stove to rise; as soon as they rise, bake in a quick oven.

The Opium Habit.

According to reports made at the recen meeting of the American Missionary Association, the labors of American missionaries have of late been reasonably successful. The mission in Burmah is a novelty, being self-supporting. In China the opium habit has proved the greatest foe to Christianity, and is met at every turn. As to the vast field of India, it is "yielding a glorious harvest. The years spent in patient preparation of the soil and in seed sowing have not been spent in vain. The results of many years seemed small, but it is well to remember that the seed of the Gospel, when faithfully scattered, will surely germinate sooner or later." In Turkey "a few of the Moslems are diligent readers of the Bible, but the day has not yet come when the Gospel can be preached to them openly. New Churches have been organized the past year, new schools opened, native pastors ordained, and many converts received." In Japan "results have appeared promptly in response to effort, and many societies have been attracted to this on account of its great promise. Several new missions have been established within two or three years, and stations are being opened in various parts of the empire." The African field is being occupied as rapidly as possible, and there is declared to be no reason for discouragement in that quarter.

A Woman Farmer.

One of the most enthusiastic admirers of Gen. Hancock in Ulster county, New York, is Miss Libbie Schoonmaker, whose career as a farmer, stock raiser, and school teacher has made her notorious in that part of the state. Miss Schoonmaker, who is a woman about 38 years of age, is a striking example of what a woman with a will of her own can do toward getting along in the world. Fourteen years ago, at the death of her father, Johannes Schoonmaker, she inherited a large estate, consisting principally of farming property, heavily encumbered with debt. It was the old homestead, and Miss Schoonmaker could not bear the idea of seeing it pass into the hands of strangers, and was determined that it should not. Although then only 24 years old, and with no more practical knowledge of life than an ordinary country lass, she assumed sole charge of the estate, determined to clear of debt. Having an old mother 62 years of age, a half sister, also helpless from old age, the two orphan children of a deceased brother, and a brother in the last stages of consumption, to provide for, this made her task doubly hard. A little experience taught Miss Schoonmaker that it was impossible to support her large family and keep up the interest arising from the heavy indebtedness of the estate from the resources of the farm. She accordingly began to devise some method of increasing her income, and decided upon school teaching. She was engaged to teach in her own neighbourhood at the modest sum of $8 per month. In this, as in everything else, she showed remarkable tact, and her salary in a short time was raised to $40 per month. She has continued school teaching ever since, overseeing and directing the work of her farm, night and morning, and during summer vacations going into the harvest field with the farm hands to pitch the hay, rake, bind, etc. She has earned from teaching school over $3,500, paid off the debt of the old homestead, and besider greatly improved the property. Besides teaching and raising corn and grain, she has been an extensive stock-raiser. As a farmer she has no superior in this section. Her wheat crop averaged this year forty-two bushels to the acre, the largest yield in the county.

In personal appearance Miss Schoonmaker is tall, with a robust, but comingly form, and and a pleasing, intelligent countenance. She is exceedingly kindhearted and generous, and and will spend her last cent for the benefit of a needy friend or acquaintance. A short time ago she learned that a brother-in-law living in Pennyslvania was in destitute circumstances. She went to him and found him helpless from an incurable disease, with a family depending upon him. "Ben," she said, "what can I do for you?" "Nothing Libbie," was the reply. "You have your hands full already. We will have to go to the county house, I suppose." "Never, Ben, as long as I live. Come and enjoy the comforts of the old homestead with me. I will keep you and your family as long as you live."

Miss Schoonmaker has had many suitors for her hand, but, although naturally inclined to matrimony, she steadily refuses to marry, on the ground that her husband might in time object to be burdened with the support of the old people and her helpless brother-in-law and his family, which might cause domestic troubles. Besides, she says she has enough to do now without having to support a husband, too, which she might have to if she were to marry.

Mr. Bartlett and the Baroness.

(From the London World.)

It is now generally understood among the Baroness Burdett-Coutts's friends and near relations that she has quite resolved to carry out her intention of marrying Mr. Ashmead Bartlett, but with the proviso that the settlements shall be all on her own side, and her money (such as remains to her) safely tied up. It is also believed that the marriage will not take place till all legal difficulties with regard to the Duchess of St Alban's will are cleared up.

The number of yearling thoroughbreds from the great breeding establishments of England sold during the past year aggregated 451, the progeny of 112 sires. They realized 89,996 guineas—a decrease in the amount paid to breeders of 41,773 guineas as compared with 1877, when 486 yearlings brought 131.666 guineas.

A London tailor has invented "the united suit," which consists of a man's complete attire in one garment.

SMILES.

Oleomargarine isn't dairy maid.

Chestnuts don't have wings, but are sort of burred-like.

What do "eating apples" eat and how do they do it?

Flowing locks—Those of a canel—when they're opened.

You will regret to learn that the Maharajah of Jeypore died last month.

The infanta of Spain has begun to take notice, and the King has ordered a bull-fight. The child's education will begin at once.

"Do you get any holidays in you office?" asked a returned divine of a cheery-looking worker in secular walks. "Oh, yes, we get a day to get buried on."

"Never borrow trouble," said a husband to his wife. "Oh, let her borrow it if she can," exclaimed the next door neighbour; "she never returns anything you know."

The boundary line between infancy and childhood has been passed when mamma's darling can no longer take castor oil without making a face like pickled tripe.

Beaconsfield's new novel is to be called "Endymion." We give the old gentleman this free notice as we hope his book will sell well and help him out, financially.

At a London bazaar recently a lady handed round her baby to be kissed at sixpence each. If it were a girl baby we would have paid the price and taken a due bill due in sixteen years.

A Brooklyn man sued a dentist for $500 damages, on account of pulling the wrong tooth, and recovered $30. The dentist, as he handed over the money, said it came out of him "like pulling teeth."

"Neter marry a woman," remarked an old observer, "until you have dined her at a public restaurant. If she calls for such dishes as pork and beans, or corn beef and cabbage, your future happiness will be secure in her keeping."

A rural chap who witnessed the unloading of Cleopatra's Needle says he don't wonder that the dusky Queen committed suicide by taking a viper to her bosom, if she had to sew buttons on Mark Antony's pantaloons with a needle nearly seventy feet long, or make shirts for the Jew dealers of Egypt at five cents a shirt.

The British Census.

(From the London Times.)

Three acts were passed in the recent session for taking the census of the population of the United Kingdom. The first relates to Ireland (43 and 44 Vic., cap. 28). Under the direction of the lord lieutenant houses are to be visited on Monday, the 4th of April, and other days, as appointed, and the population on the premises on Sunday night, the 3rd of April, to be ascertained, and among the particulars to be gathered is the "religious profession" of each inmate. There are penalties for withholding or giving false information, with a proviso that no person shall be subject to such forfeiture for refusing to state his religious profession. The provision is omitted in the other statutes. The next act (cap. 37,) relates to England, and the local government board is to superintend the taking of the census. There are householder schedules to be left in the course of the week ending Saturday, April 2, and to be collected on Monday, April 4, with particulars as to all persons who were on the premises on Sunday night, April 3, with penalties for neglect or false answers. The act as to Scotland is chap. 38, and the secretary of state is to superintend the census, and penalties are to be imposed for disobedience of the directions given as to householders' schedules. In the United Kingdom the census is to be as to persons on Sunday, the 3d of April next.

Eugenie's once lovely auburn hair is now nearly white, and her beautifully shaped face has become wan and thin.

"Change cars for New York," cried the brakeman of the Great Western Railroad express at Clifton, Ont. An old man had just changed routes, but not for New York. He expired alone and uncared for. He was over 70, had come from Council Bluffs. Thirty-three dollars in gold were found on him, together with $245 in bills tied in an old handkerchief around his neck.

MARKET REPORTS

CANADA LUMBERMAN OFFICE,
TORONTO, 15th Nov., 1880.

There is no change to note in reference to stocks of lumber on hand in this city. Local trade is good. Building continues brisk. Carpenters' wages may be quoted at $1.50 per day. The Northern Railway made great efforts to bring in outstanding sawn stuff from Gravenhurst, &c., and has succeeded in clearing the yards there. The storm of the past week, which proved so disastrous on Lake Ontario, has disorganized shipping to the United States, for the time being, but as soon as vessels can come up, to the balance of the season's trade will be completed. Vessels for Oswego are still in demand at $1.50. Prices are keeping up in New York and Boston for hardwood. In the former city the supply of walnut is limited, and the better grades of wood are arriving slowly. The Lumberman's *Gazette*, Nov. 8, states unsettled weather has had a damaging effect on the lumber trade. Prices firm. Freights on lumber rising. Recent sales shipped by rail.

Front and Esplanade Streets, Opposite the Queen's Hotel,

TORONTO.

NET ASSETS, JAN. 1, 1879 $23,761,342. **ÆTNA LIFE** INT'REST RECEIVED, 1879 $1,856,710.

RATE PER CENT., 7.81

That the above is a most satisfactory and profitable rate of interest will be conceded by all. But the careful attention paid to this, as to every other department, by the Directors of the **ÆTNA LIFE INSURANCE COMPANY**, will be more apparent when viewed in the light of the following figures, found in the latest published reports of 3 American, 3 British, and 3 Canadian Life Insurance Companies:—

NAME.	ASSETS.	INTEREST.	RATE.
Equitable, New York	$34,195,368	$1,950,680	5.70
Union Mutual	6,874,249	344,591	5.01
New York Life	35,630,557	2 021,887	5.67
London and Lancashire	851,720	37,325	4.38
Reliance, of London	2,379 410	109,720	4.61
Standard, of Edinburgh	25,939,685	1,120,255	4.31
Canada Life	3,070,988	199,504	6.49
Sun Mutual, Montreal	319,178	21,774	6.82
Mutual, Hamilton	88,068	4,684	5.26
Average	$12,149,797	$644,436	5.35
ÆTNA LIFE,	$23,761,342	$1,856,710	7.81
5 35 per cent. upon $23,761,342 is only		$1,271,131	

Upwards of **$585,000** was therefore realized in 1879 by the ÆTNA'S management from its **$23,761,342** over and above the average of the nine Companies. This is a point of great importance to persons desiring to insure their lives on the "WITH PROFITS" plan. ☞ All the profits in the **ÆTNA'S** Mutual Department belong to the Policyholders.

Receiving, as above shewn, a more profitable rate of interest on its funds, and also transacting its large business at a great saving in general expenses, compared with others, this Company is able to offer the public more favorable rates, as may be seen from the following examples. The three endowment columns show the premiums at 40 years of age:

$1000.

A Story of Chopin.

At the little town of Zullichau, Chopin and his friend, finding that they had an hour to wait for horses, Professor Jarocki proposed a walk through the place. This did not take long, and as the horses were not ready when they returned, the Professor sat down to a meal—the post-house being also a restaurant. But Frederic, as if drawn by a magnet, went into the next room, and saw—oh, wonder of wonders!—a grand piano. Professor Jarocki, who could see through the open door, laughed to himself when his young friend opened the instrument, which had a very unpromising exterior. Chopin also looked at it with some misgivings; but when he had struck a few chords he exclaimed, in joyful surprise, "O Santa Cæcilia, the piano is in tune." Only the impassioned musician knows what it is, after sitting for several days in a diligence, suddenly and quite unexpectedly to have an opportunity of playing on a good instrument. Regardless of his surroundings our artist began to improvise *con amore*. Attracted by the music, one of the travellers got up and stood behind the player's chair. Chopin called out to Professor Sarocki, in Polish, "Now we shall see whether my listener be a connoisseur or not." Frederic began his Fantasia on Polish songs (op. 13); the traveller, a German, stood like one petrified, captivated by this music, so new and bewitching; his eyes mechanically followed every movement of the pianist's delicate hand; he had forgotten everything, even his beloved pipe, which went out unheeded. The other travellers stepped in softly, and at the same time the tall postmaster and his buxom wife appeared at the side door, with their two pretty daughters behind them. Frederic, unmindful of his audience, and absorbed in converse with his muse, had lost all thought of where he was, and that he must soon be on his way. More and more tender and graceful became his playing; the fairies seemed to be singing their moonlight melodies; everyone was listening in rapt attention to the elegant arabesques sparkling from his fingers, when a stentorian voice, which made the windows rattle, called out, "The horses are ready, gentlemen."—"Confounded disturber," roared the postmaster, while the triplet of ladies cast angry glances at the p stilion. Chopin sprang from his seat, but was immediately surrounded by his audience, who exclaimed with one voice: "Go on, dear Sir, finish that glorious piece, which we should have heard through but for that tiresome man."—"But," replied Chopin, consulting his watch, "we have already been here some hours, and are due in Posin shortly."—"Stay and play, noble young artist," cried the postmaster, "I will give you courriers' horses if you will only remain a little longer."—"Do be persuaded," began the postmaster's wife, almost threatening him with an embrace. What could Frederick do but sit down again to the instrument! When he paused the servant appeared with wine and glasses; the daughters of the host served the artist first, then the other travellers, while the postmaster gave a cheer for the "darling Polyhymnias," as he expressed it, in which all united. One of the company (probably the town cantor) went close up to Chopin and said, in a voice trembling with emotion, "Sir, I am an old and thoroughly trained musician; I, too, play the piano, and so know how to appreciate your masterly performance; if Mozart had heard it he would have grasped your hand and cried "Bravo." An insignificant old man like myself cannot dare to do so." The women, in their gratitude, filled the pockets of the carriage with the best eatables that the house contained, not forgetting some good wine. The postmaster exclaimed, with tears of joy, "As long as I live I shall think with enthusiasm of Frederic Chopin." When, after playing one more mazurka Frederic prepared to go, his gigantic host seized him in his arms, and carried him to the carriage."

Surely music has a strange power and fascination, when even a tobacco-loving German could allow his pipe to go out; and so indeed thought Chopin, when relating the incident to his friends in after years.

AMONG the royal people Forbes met were four kings up an opponent's sleeve at a card table.

AN extravaganza company advertised in Pittsburg that they would pay a reward to anybody who could find the shadow of a plot in "The Flock of Geese," the play which they performed. So few persons went to the theatre to search that the company disbanded, and the manager pawned a diamond pin to pay their fares to this city.

Garibaldi at Genoa.

(London News.)

Garibaldi's formal request for permission to visit his son-in-law was promptly and courteously answered. The arrangements were left entirely to his own convenience, and he choose to go down shortly after 11 o'clock this morning. As soon as the open carriage in which he reclined appeared in the streets a crowd, momentarily growing in numbers, and increasing in enthusiasm, surrounded it. The people, even in moments of wildest excitement seem full of tender pity for the maimed hero, and no desire to touch the hem of his garment will induce them to run the slightest risk of injuring him in a crush. This morning about a score of volunteers from the crowd linked arms and marched at the back and by the sides of the carriage to keep off the pressure. Within this corden walked one of the Garibaldians, an old grizzled soldier, who had supplied himself with an undersized alpaca umbrella. When the carriage, occasionally passing out of the shadow of the high houses, came into the sunlight up went the alpaca umbrella trembling in every rib from an undue expenditure of strength in the effort of opening it, and Garibaldi's head was sheltered from the sun's rays. As yesterday, all the house fronts were thronged, and once, as the carriage passed along the Via Roma, a shower of bright flowers rained from an upper window half filling the carriage, and casting undesigned largesse among the crowd.

The return journey was marked by similiar manifestations of enthusiasm, always, as it seems to me, tempered by tenderest pity. There is, perhaps, no parallel in the world to the peculiar regard of a people for a man such as is displayed in Genoa to-day, toward Garibaldi. He has been so strong in their behalf and is now so weak in his own, that tears start in the eyes of strong men, as they look upon him carried helplessly through their streets, bent, to-day, as ever, upon doing what he holds to be right, though the heavens fall. As the carriage neared the prison to-day I saw a well-dressed middle-age man force his way through the crowd till he was as close to Garibaldi as the girations of the alpaca umbrella made it safe to be. He uncovered his head, and with passionate gestures kissed his hand to the old man, who did not even observe his approach. This done, he quietly walked back to his shop and resumed business. If the people could only take up Garibaldi in their strong arms and nurse him back to health and strength, they would abandon all other occupations to perform this task of love and duty. They will do anything for him except work themselves up into a condition of dangerous excitement, because a not very wise man who chances to be his son-in-law has done a silly thing, and the civil authorities, inoculated with the prevalent folly, have thought it worth while to take him *au serieux*.

You Have no Excuse.

Have you any excuse for suffering with Dyspepsia or Liver Complaint? Is there any reason why you should go on from day to day complaining with Sour Stomach, Sick Headache, Habitual Costiveness, palpitation of the Heart, Heart burn, Water-brash, Gnawing and burning pains at the pit of the Stomach, Yellow Skin, Coated tongue, and disagreeable taste in the mouth, Coming up of food after eating, Low Spirits, &c. No! It is positively your own fault if you do. Go to your Druggist———and get a bottle of GREEN'S AUGUST FLOWER for 75 cents your cure is certain, but if you doubt this, get a Sample Bottle for 10 cents and try it. Two doses will relieve you.

A Stubborn fact.

Dr. Fowler's Extract of Wild Stawberry is, without a doubt, the safest and most reliable remedy in existence, for diarrhœa, dysentery, cholera morbus, sour stomach, sea-sickness, and all summer complaints. It acts like a charm. Its effects are marvelous—relief instantaneous, cure speedy, Physicians and all who use it recommend it. It should be kept in every home at this season, for use in cases of emergency. For sale by all dealers.

SEVERAL noblemen in England are in the habit of giving special orders to makers in Virginia for their supply of smoking tobacco. There is no doubt that by that means they get the very best tobacco to be had, but it costs them about $2 a pound. The workingman of Canada are smoking the very same quality of tobacco at 60 cents a pound, and it is known to them by the name of "Myrtle Navy."

SUMMER COMPLAINTS, OR CHOLERA INFANTUM, which is carrying off the infants and the children by the the thousand at this season of the year, can always surely be checked and cured by Dr. Fowler's Extract of Wild Strawberry. It has never failed to give immediate relief in the most severe cases. It is a boon within the reach of every mother. Do not fail to give it a trial; you will be pleased with its charming effects. For sale by all dealers.—T. MILBURN & CO., Toronto.

Cure of Kidney Complaint.

344 Parliament Street,
TORONTO, April 17, 1880.

T. Milburn & Co.

GENTLEMEN,—I have been for over a year subject to serious disorder of the Kidneys, often being unable to attend to business. Your Burdock Blood Bitters was recommended as a good remedy. I obtained a bottle, and am happy to say that I was relieved before the bottle was half used. I intend to continue, as I have confidence that it will entirely cure me.

Yours truly,
BRUCE TURNER.

HAVE you neard of the wonderful cures effected and benefits derived from the use of Edison's Electric Belts. If not, call on your druggist for pamphlet with testimonials. They are as food to the hungry, as water to growing plants, and as sunlight to nature.

"I havs no hesitancy in recommending Dr. Fowler's Extract of Wild Strawberry."—G. W. SEARL, St. Catharines. I would advise any one suffering from summer complaints to give Dr. Fowler's Extract of Wild Strawberry a fair trial."—CARMAN M. GOULD, M.D., Castledon. "Dr. Fowler's Extract of Wild Strawberry gives perfect satisfaction."—THOMAS DOUGLAS, Cambray. "Can recommend Dr. Fowler's Extract of Wild Strawberry with confidence."—JUDGE S. S. PECK, Minden. "My customers bear high testimony of the virtues of Dr. Fowler's Extract of Wild Strawberry."—T. STEVENSON, Orangeville.

DR. FOWLER'S EXTRACT OF WILD STRAWBERRY is the most successful medicine known for all summer complaints, diarrhœa, dysentery, cholera morbus, etc. Its effects are marvellous. It acts like a charm; relief is almost instantaneous. In sea-sickness and vomiting it is a specific worth ten times its cost. Equally good for the young, the old, and the middle-aged. For sale by all dealers. T. MILBURN & CO., Toronto.

COLLARS and Cuffs, new styles, Kid Gloves, new shades, one and two-buttoned, Silk Handkerchiefs, new patterns, Silk Umbrellas, new and cheap, at Cooper's, 109 Yonge street, Toronto.

DR. FOWLER'S EXTRACT OF WILD STRAWBERRY. This preparation stands peerless as a remedy for all summer complaints. Have you diarrhœa? It will positively cure you. Are you going on a sea voyage? Be sure and take a bottle of the Strawberry in your haversack, for use in sea-sickness, vomiting, and other irritations of the stomach and bowels; it will positively cure you. Every one speaks highly of it.

"THEY ALL DO IT."—For beautifying the teeth and preserving, for sweetening and giving fragrance to the Breath use "Tea-berry" the new Toilet gem delightfully cooling and refreshing.

Killed by a Mustang.

A Tale Told in a Texas Cow Boy's Camp.

(From the Cincinnati Enquirer.)

It was a clear moonlight when, after a hard day's "drive," and the herd of wild horses had been penned, the cow boys stripped their tired ponies of saddles and bridles, and stalked them out to graze on the thick mesquir grass which fringed the bank of the San Bernardo.

After this duty had been attended to, the cooking utensils were brought forth, and soon the coffee pot was singing a musical little song, and a leg of fresh calf ribs spluttering before the fire. The repast, though rough, was made enjoyable by an appetite which only violent exercise and pure air can give, and after the boys had eaten until it became necessary to unbuckle their six-shooter belts, blankets were spread under the branches of a live oak, which seemed to stand guard over the broad expanse of prairie, and they settled down for a quiet smoke."

"I tell you what, boys," said Ned Curtis, who was one of the hardest riders and best poker players west of the Brazos, as he lit a cigarette, "we are going to handle some pretty rough mustangs to-morrow, and if any of you fellows want to show your fancy riding you had better be fixing your flank girts and rolls, because there are some unbranded four-year olds in that bunch, who are going to make you hum like a churn-dasher, and you'll have to fork 'em deep to stay in the saddle. There is one in the pen thar is a perfect picture of the mustang mare that sent Bill Hall to the angels."

"Wasn't he some galoot from the old States?" inquired one of the boys, turning over on his blanket.

"Yes," replied Ned, "he was a long tow-headed chay, greener than an August persimmon, with legs shaped like a pair of hames."

"How did he happen to get killed, Ned? Did the mare flirt him a little too strong?"

"Yes, that was the way of it. You see, he had just come from Georgy, and had never been on the back of a wild horse before in his life, but he was spunky with all of that, and wasn't scared of anything. One day, while driving out in Nueces County, we made 'round up' of all the horses in the range, and after 'cutting out' all that were in the 'diamond P' brand, the boys began throwing come down and riding 'em, just to see the wild devils 'buck.'

"Well, Bill Hall took a darn fool notion to ride one himself and he picked out a little Roman-nosed mustang mare, pure Spanish, and wilder than a cayotte, and got some of the boys to help him throw her down, because he didn't know any more about handling a lariat than he did about running a prayer meeting.

"When the saddle had been strapped on her and Bill forked it, she was turned aloose, and the crowd stood back to see the fun. Well, sir, that plug raised her head, looked back, bellowed a couple of times, and then she lit into the prettiest bucking I ever looked at. 'Stick to her, Bill!' I yelled, but the only thing he could say was, 'Whoa! Stop her, boys; darn her old hide.'"

"While he had his knees gripped to her sides like a vice, and his hair standing like a brush heap, the mustang stretched herself out like a step-ladder, put her head between her front legs, and then, bringing herself together like a rat-trap, she slammed Bill Hall against the ground harder than I ever heard a fellow hit before. When we picked him up one ear was jammed around to the back of his neck, and from the look on his face, we knew that he wasn't long for this world. He lingered for a day or two, and we did all we could to ease his pain, but one morning he motioned for us to come to him, and as I kneeled beside his couch and took his hand in mine he said: 'Boys, I'm going to pass in my checks, but I ain't going to shiver about it, even if I do die out on a prairie, with no one but a few friends around me. I'll have a big broad bed to rest in, and if some day you ride by my grave won't you get down and think of me awhile?'

"Well, sir, the boys—the ornary cusses—were crying like women, and I felt terribly shaken myself, but we all promised that we would, and then he raised himself a little, and in a faint voice said: 'Ned I want you to write to my mother and tell her that I wasn't a very dutiful son, but I loved her just the same.'

'Ned,' he muttered so faint I could hardly hear him, 'don't tell my folks when you write that I was slid into Heaven by a d—d mustang," and with that his head fell back, his grasp on my hold relaxed, and Bill Hall was on this earth no more, and when I thought how his mother would grieve it made me feel weak in the knees.

"We buried him, and Jack Jones, who is something of a scholar because he had a chance to go to school down in Bay Prairie, wrote on the headboard of the grave:

"WILLIAM HALL
GOT A FALL,
Killed dead as a Slug
By a Texas Plug.
BORN IN GEORGY,

"It always makes me feel bad when I think of that poor fellow, and how to-day he sleeps on the bank of the Santa Gertrudes with nothing but a big live oak to mark his last resting place in the bosom of the prairie. Do any of you fellows want a little draw-poker to-night?"

From the Talmud.

"Who is strong? He who subdues his passion. Who is rich? He who is satisfied with his lot." "He who sacrifices a whole offering shall be rewarded for a whole offering; he who offers a burnt-offering shall have the reward of a burnt-offering; but he who offers humility to God and man shall be rewarded with a reward as if he had offered all the sacrifices in the word." "There are four characters in scholars: Quick to hear and quick to forget, his gain is canceled by his loss; slow to hear and slow to forget, his loss is canceled by his gain: quick to hear and slow to forget is wise; slow to hear and quick to forget, this is an evil lot." "There are four characters in those who sit under the wise; a sponge, a funnel, a strainer, and a bolt-sieve. A sponge, which sucks up all; a funnel, which lets in here and lets out there; a strainer, which lets out the wine and keeps back the dregs; a bolt sieve, which lets out the pollard and keeps back the flour." "He who has more learning than good works is like a tree with many branches but few roots, which the first wind throws on its face; while he whose works are greater than his knowledge is like a tree with many roots and fewer branches, but which all the winds of heaven cannot uproot." "If thy wife is small, bend down to her and whisper in her ear. He who forsakes the love of his youth, God's altar weeps for him. He who sees his wife die before him, has, as it were, been present at the destruction of the sanctuary itself—around him the world grows dark." "He who marries for money, his children shall be a curse to him." "Rabbi Jose said, I never call my wife 'wife,' but 'home,' for she indeed makes my home." "Underneath the wings of the seraphim are stretched the arms of the divine mercy, ever ready to receive sinners."

A Neat Reply.

Dr. Mountain, chaplain to King James I., waiting upon his majesty when he was walking in St. James' park, the king said to him that he was more troubled how to dispose of bishopric of London, which was then vacant, than ever he was in his life. "For," said he, "there are many who apply with so strong an interest that I know not to whom to give it." "How?" said the chaplain. "If your Majesty had as much faith as a grain of mustard seed, you might say to this mountain: 'Be thou removed and be thou cast into the sea.'" It is said that the king rewarded this piece of ready wit by the immediate bestowal of the mitre.

THE late President Thiers was again honoured in Paris, a few days since, by the unveiling of a statue, with the inscription, "First President of the Republic." He holds the map of France in his hands, with the word "Belfort" standing out in large gilt letters, indicating the fortress which he successfully expended his every effort to wrest from the Germans.

LUMBER YARD!

CORNER BERKELEY AND FRONT STS.

Planing Mill, No. 57 Ontario St. - - - . Mills at Elmvale.

WHOLESALE AND RETAIL DEALERS IN

LUMBER, SASH, DOORS, BLINDS, &c.

Largest and Best Stock of Lumber in the City at Lowest Prices.

WE HAVE CONSTANTLY ON HAND A LARGE STOCK OF

SASH, DOORS AND BLINDS, ETC., ETC.,

Which we sell at Lower Rates than they can be had anywhere else in the City,

SPECIAL ATTENTION GIVEN TO FILLING OF BILLS OF EVERY DESCRIPTION

Houses built on easy terms of payment. Houses to rent or for sale in any part of the city

☞Best price paid for Lumber of all kinds, cedar posts, &c.☜

The Queen's Hotel, Toronto, Canada.

McGAW & WINNETT, Proprietors

☞ Patronized by Royalty and the best families. Prices graduated according to rooms.

STANDARD CHOPPING MILLS,

USING BEST FRENCH BURR MILL-STONES. SIMPLE, EFFICIENT, PRACTICAL. CAN BE RUN BY ANY INTELLIGENT MAN, NO RENEWING PLATES AS IN IRON MILLS. GRINDERS WILL LAST A LIFE TIME.

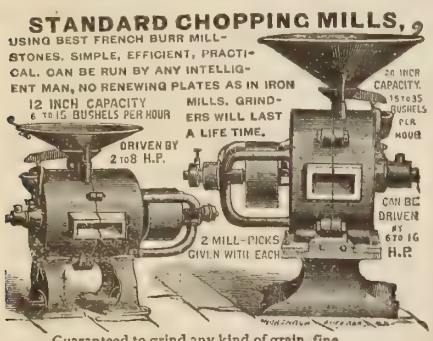
12 INCH CAPACITY 6 TO 15 BUSHELS PER HOUR

DRIVEN BY 2 TO 8 H.P.

30 INCH CAPACITY. 15 TO 35 BUSHELS PER HOUR

CAN BE DRIVEN BY 6 TO 10 H.P.

2 MILL-PICKS GIVEN WITH EACH



Guaranteed to grind any kind of grain, fine or coarse, equally as well, as a four foot millstone.

WATEROUS ENGINE WORKS CO., BRANTFORD, CANADA.

MILLSTONE

CHOPPING MILLS FOR LUMBERMEN.

Wil grind as fine as any four-foot stone.

Lumbermen, grind your own Horse Feed.

Make your own Flour with *our* Portable Grist Mill.

PRICE, Grist Mill complete, $600. Capacity, Our and a half barrels of good flour per hour,

Send for particulars, address

Brantford, Ontario, Canada.

MACHINERY OILS!

To Dealers and Consumers.

STOCK OLEVINE,

Equals Castor Oil, and

Warranted not to Gum.

STOCK OLEVINE

Equals Castor Oil, and

Warranted not to Gum.

It will give the subscriber much pleasure to forward, post free, to any address, on application, pamphlet, containing instructions and information that have been found of the greatest practical use to dealers and consumers of machinery oil in Canada. It contains the fullest information as to the different kinds of oils, their qualities and uses, thus enabling the consumer to make choice of the very oil best adapted to his wants, and also enables the merchant to select the kinds most likely to be in demand in his neighborhood. This pamphlet shows conclusively that oils properly manufactured from petroleum, are vastly superior to any *animal* or *vegetable* oil. I am now making the same qualities of "Extra" and "XX" oils I manufactured from 1870 to 1873. They are *guaranteed not to thicken wit extreme cold*, and warranted to give satisfaction in every particular. Beware of Agents soliciting your orders without my trade-marked order-book. Address

MIRAMICHI.

The *Timber Trade Journal* commenting on the trade at Miramichi says :—

Miramichi (conversationally pronounced *Merrimashee*) has always stood next to Quebec for the quality of its yellow pine produce, and some years ago its hewn timber sent here was esteemed by many, who were good judges, to be better on the whole even than that of Quebec, more free from small knots, and *kinder* to work (to use an expressive term in joinery) ; but it stood second to it usually at market, because it was not so well squared, nor turned out of hand so evenly. But, as that district has not so great a choice of interior forests to draw its supplies from as Quebec (which intercepts all the rafts coming down the mighty St. Lawrence, between it and Montreal), its timber gradually became of smaller average size than that of Quebec, and eventually it was found more profitable to convert it into deals, boards, and scantlings, and its hewn timber has therefore almost disappeared from our markets, as may be proved by the fact that, out of over 150,000 loads shipped there this season, 824 only were hewn pine timber and 883 birch.

Miramichi was one of the ports that were late in opening this year, or rather that vessels could not reach till some time after the port itself was free from obstruction on account of the drift of ice between Cape Rae and the Magdalen Islands, and from subsequent information as to drought all along that coast, and the stoppage of mills for want of water—which was dwelt on by correspondents in August last as serious impediments to our further supplies from the lower ports—a diminished export was strongly insisted on from those regions. Even if supplies, contrary to expectation, should be up to the average there for shipment to this country, another difficulty was exhibited to us—there would not be enough ships to fetch it away. Late arrivals out, and long passages home, had thrown the bulk of the spring fleet into the month of August, and not many of them, it was argued, would be able to accomplish a second voyage. At all events few, if any o them, have completed their second voyage yet ; but, despite these obstacles, we cannot accuse Miramichi of being any party to such deficiency. as may eventually appear, when the Board of Trade returns come to be made up at the year's end, as will be seen by referring to the statement issued to the 2nd of Sept. last and compared with the exports of the two previous years. In 1878 the United Kingdom imported a great deal more timber than it had any need to have done of which Miramichi furnished us with the principal part of 78,321,890 M. feet, or 130,536 loads. But having large stocks in this country when the next season began, and trade going from bad to worse, in 1879 the export trade of Miramichi fell off in like proportion, and in that year the shipments only reached 69,586,919 M. feet, or 115,979 loads. But this last year of 1880, always reckoning each year from September to September 2nd, reached the total of 89,274,856 M. feet, or 148,791 loads, 14 per cent. more than 1878, and 25 per cent. more than 1879. So much for the anticipated shortage in the colonial timber, as far as Miramichi is concerned. The proportion of Miramichi exports to this country may be reckoned as four-fifths of its whole production, if not something more ; but we shall probably get more exact returns later in the year.

OTTAWA VALLEY LUMBER TRADE.

A despatch from Ottawa dated, Nov. 20th, states, that the total value of products of the forest sent from the port of Ottawa in 1879 was $1,199,844, as against $1,518,623 for the first three-quarters of the current year. This was largely represented by lumber, the quantity being as follows : Last year 117,002,000 feet were exported and for the first nine months of the current year 139,056,000 feet. The total cut of lumber by the mills of this immediate locality this current year is about 235,000,000 feet, representing a value of nearly three million dollars. The following is the estimate ; E. B. Eddy. 40 000,000 feet ; Bronson & Weston, 37,000,000 ; Perley & Pattee, 30,000,000 ; J. R. Booth, 30,000,000 ; Gilmour & Co.'s mill, 30,000,000 ; Sherman, Lord & Co., 25,000,000 ; Capt. Young, 13,000,000 ; McLaren & Co., 15,000,000 ; McClemont & Co., 10,000,000. The price of stocks during last season ranged at from $12 to $15 per thousand and this year from $12 to $18. A leading lumberman says the prospects are that the market will rule about the eame next year as it has this. No contracts have been made yet by any of the Chaudiere or Hull firms to his knowledge. The production of lumber will cost more the coming season than it has this owing to the advance in wages which will about cover the difference in price of stocks this year over last. There were sixteen hundred thousand logs received this summer as against nine hundred and seventy thousand last year, being the second largest quantity ever brought down to the Chaudiere. In the history of the Ottawa Valley, 1873 was the best year, 1,750,000 logs having come down. It is estimated that 1,700,000 or 1,800,000 logs will be taken out this winter. The outlook regarding the lumber business and timber trade is most encouraging. Thirty-five rafts of square timber were brought down the past summer, as against thirty in 1879. Next year it is thought that ninety rafts will come down.

DESTRUCTION OF FORESTS IN NEW ZEALAND.

Notwithstanding the fact that total the area of forest Crown lands in New Zealand amounts to no less than 10,158,870 acres, fears are being officially expressed that the destruction of trees is carried on so rapidly as to endanger the future supply of timber in the Colony. The report of the Crown Lands Department for the year ending June 30 last, states that the stock of some of the most valuable timber trees is being exhausted more quickly than it can be replaced by the natural growth of young trees, and in a wasteful manner which is, in the future interest of the Colony, much to be regretted. It is estimated, for instance, that, although the noble and valuable Kauri forests cover an area of 230,000 acres, and, reckoning only two trees to the acre, and 5,000 feet of timber to each tree, contain altogether about 2 300,000,000 feet of timber, the whole existing supply will be exhausted within twenty-one years at the present rate of destruction. These Kauri forests are very susceptible to fire, and, when once started, will burn with great fury. Besides this source of danger, the young plants are liable to destruction by cattle, and their growth is thwarted in various other ways. The relative proportions of the various other timber trees in New Zealand are only imperfectly known ; but recent examination has shown that, besides the Kauri, several of the more highly prized kinds are being rapidly exterminated. Such an event would be deplorable from many points of view ; for, not only would the resources of the Colony be seriously crippled, but its climate must suffer from the denudation of its forest lands.

BRITISH COLUMBIA

This Western Province of the Dominion of Canada, including Vancouver and other islands, has an area of 330,000 square miles. It has a seaboard, and an air line, of 550 miles. Throughout the whole extent of the Province there is an abundance of forest land, the timber on which is of the most valuable description ; one kind especially, says the Standard Atlas, the Douglas pine, yields spars from ninety to one hundred feet in length, without knots or branches. The diameter varies from six to ten feet, and in quality is about twice as strong as Canadian red pine, and being more gummy, is more durable. At Burrard Inlet, nine miles from New Westminister there are pine trees twenty-seven to thirty feet in diameter. The yearly exports of timber amount to about $500,000, but the vast forests have hardly been touched.

The mineral resources of British Columbia are very great. Gold is found in great abundance in the Cariboo district, and along the Fraser and Thompson rivers. In 1870, the yield from the Cariboo district exceeded one million dollars, while the yield for the entire province for the past ten years has exceeded twenty-two million dollars. Silver and copper are also to be had in abundance, but the mines have not as yet been very largely worked. The true wealth of the province, however, is its coal fields, which are inexhaustible, easy of access, and easily worked. Bituminous coal is found on Vancouver Island. The latter has been sold in San Francisco at $20 per ton. The annual exportations of coal exceed $200,000.

COMPLIMENTARY.

We have to thank Messrs. Waterous, of Brantford, for the complimentary terms in which they have referred to the LUMBERMAN. We are glad to notice from the *Monetary Times* of the 19th inst. that Mr. Peter Loggie's mill, Chatham, N.B., can saw 84,000 feet of lumber in ten hours, and that it has turned out 4,000,000 superficial feet in six months, between 18th May and 15th Nov. this year. The machinery of this 35 horse power steam mill was built about four years ago by the Messrs Waterous, and has worked satisfactorily ever since.

—Estimated quantity of square pine timber to be taken out on the Upper Ottawa and tributaries this winter received, and will appear in next issue.

The Epizootic.

A sick horse is not a nice object to chromo ;
Good health is essential to horse as to homo ;
But you won't cure the creature by giving
him bromo

And if you are prudent, possessing acumen,
You won't employ sulphur, or pills, or bitumen—
And just the same way if the patient is human.

Not any ! My friend, I'll reveal to you
what'll
Restore him. Just rest him and poultice his
throttle—
Don't dose him with anything out of a
bottle.

Ventilate. Fumigate. Feed him on gruel.
Wrap him up. Coax and caress him, for
you will
Save a sick horse by observing this ru-el.

Swab his nostrils with tepid like water or
brandy,
For he can't wipe his nose with his hoof, you
see, and he
Is so rigged he can't use a handkerchief
handy.

If a chap comes along with "a sure panacea,"
Go lead him right out of the barn by the
ea' ;
He's the fellow that is spreading the hiprhinorhea.

S. Cunard & Company.

A SKETCH OF "THE MODEL MERCHANT AND BUSINESS MAN."

Sir Samuel Cunard, who was the son of Abraham Cunard, was born in Halifax towards the close of the last century, and for some time was a clerk in the lumber yard. Soon after the termination of the war of 1812, we find him establishing himself in business, engaging largely in the West India trade, in a general importing business, in shipbuilding and exportation of lumber—in short, in almost every kind of mercantile undertaking that promised advantage to himself, or extended the commerce of the Province. He was a man of little education, but possessed natural business talents, quick perceptions, shrewd judgment, and an excellent address, which easily made friends for himself. He became well acquainted with the military and the navy, particularly the latter, who were stationed in the colonies longer then than now, and by this means gained great influence with people in high position in England, even with the nobility.

THE ORIGINAL PARTNERS.

of the firm consisted of himself and his brother Edward. Joseph, another brother, was afterwards associated with them, but spent most of his time superintending the lumber trade in New Brunswick. Chatham, Miramichi, owes its present advanced position chiefly to his enterprise. To Mr. Cunard is due the brisk trade with the East India Company in the article of tea. By his instrumentality the large ships of this Company visited us periodically, laden with the commodity pure and genuine, direct from China, until the East India Company monopoly was abolished. To meet the business that resulted from this trade,

THE CAPACIOUS WAREHOUSE ON WATER STREET.

was built, one half of it was devoted exclusively to storing tea, and the wharf premises were greatly extended. When steam came to be used as a motive power, steam vessels began to be looked upon as possessing greater advantages than the old sailing crafts, and the question was freely discussed, was it possible to cross the Atlantic by their means. The majority of people at once declared it an impossibility. They could not contain sufficient fuel for so lengthy a voyage, and winds and currents would prove too strong for paddle wheels driven by such an agency. These and many other reasons were asserted by Lardner, a celebrated scientist of the time, in the most positive manner, as proving the utter futility of the attempt. Some spirits braver than the rest determinod to give the matter a trial and the *Sirius* was well fitted up as

A PIONEER STEAMER,

and with the additional aid of sails, performed the trip to New York rapidly and successfully. She was followed by the *Great Western*, built in Bristol in 1837 or 1838. Her Majesty's mails had heretofore been conveyed across the ocean in sailing packets, or gun brigs, as they were called, and a voyage of twenty days was looked upon as a marvel. It is well known that the Hon. William Crane, speaker of the New Brunswick Assembly, had the honour of first suggesting to Lord Glenelg, then Colonial Secretary, the idea of subsidizing a line of steamers, but the suggestion was not carried out. Mr. Cunard, who was in England at the time, and whose mind was ever on the alert for any new enterprise, made representations to the British Government, who thereupon entered into a contract with him for the conveyance of the mails

FROM ENGLAND TO HALIFAX

and Boston by monthly steamships. He then formed a company, consisting of McIver & Co., of Liverpool, Burns & Co., and Napier & Co., of Glasgow, together with himself. These firms took portions of the contracts. The steamers, four in number, were constructed in the Clyde, and were propelled by paddle-wheels, the more modern screw propellor being then unknown. They were named the *Britannia*, *Acadia*, *Caledonia* and *Columbia*, were built of wood, presented quite a fine appearance, and from their novelty were looked upon somewhat with reverence, though they would look ridiculous now-a-days when placed beside the magnificent iron-plated ocean-going palaces of the same line, that unfortunately have been withdrawn from Halifax, but may be seen any day in the harbors of Boston or New York.

THE 'OLDEST INHABITANT'

would be glad to narrate to an open-mouthed gathering of listeners what an excitement the arrival of the *Britannia* in the port of Halifax created, how the wharves were lined with eager spectators to watch the monster of the deep as it moved up the harbour and how the delighted citizens entertained Mr. Cunard to a banquet. These steamers continued their voyages for some years until the *Columbia* was lost on Seal Island, off Cape Sable, on her way from Boston to Halifax. Passengers, mails and cargo were all saved. Hon. Abbott Lawrence, who had recently been appointed United States Minister to England, was among the passengers. Meanwhile the *Hibernia* had been built and was sent out in her place.

ABOUT THE YEAR 1842

in consequence of the over-speculation of Joseph Cunard in Miramichi, and the general panic that seemed to have taken hold of commercial affairs, the firm was brought to the verge of bankruptcy. Mr. Cunard came out from England and with the assistance of the Bank of Nova Scotia and his friends, Stephen DeBlois and John Duffus, who made loans to him on large estates which he owned in P. E. Island, the firm were able to float off the quicksands. He then went back to England and never returned to reside permanently. In course of time all liabilities were settled and the firm embarked in new ventures, increased the number of their steamships, and extend their navigation to Bermuda and St. Thomas. They also established a line to New York and Mr. Cunard's eldest son, Edward—afterwards Sir Edward—was sent there to take control of that part of the business. Among the undertakings engaged in by the firm was

THE AGENCY OF THE GENERAL MINING ASSOCIATION

which, up to the year 1859, had a monopoly of the mining business of this Province. It originated in this way. The Duke of York was desperately in debt, and in order to satisfy his creditors, his brother, George IV., made a grant of all the mines in Nova Scotia—coal, gold, silver, iron,—which belonged to the Crown—to Rundel, Bridges & Co., jewellers, in London, who disposed of them to this company formed for the purpose. This took place about the year 1835, and, as a result the Albion Mines in Pictou, and Sydney, and Lingan mines in Cape Breton were largely devoloped. Mr. Cunard became very wealthy, acquired landed estates in England and was made a Baronet, an honour he lived many years to enjoy. He married a sister of the late John Duffus, and had several children. Edward, the eldest, married a grand-daughter of one of the brothers Emmet,

FAMOUS DURING THE IRISH REBELLION,

and succeeded to the baronetcy, but died a short time after. His son, Sir Bache Cunard, is the present possessor of the title. William, the next, is still living, and is now on a visit to Halifax. Two of his daughters have been well known in the Maritime Provinces ; the one as the lady of Judge Peters, of Charlottetown, P.E.I., and the other as the lady of Colonel Francklin, who, with her husband, resided for several years in Halifax, and whose son is a partner in the present concern. The firm still goes by the old name, and now owns one of the largest fleets of steamships in the world. When Sir Samuel went to England in 1849,

WILLIAM CUNARD,

and Henry Boggs—the latter of whom was a nephew of Stephen DeBlois, and had been brought up in the office—carried on the business, and continued to do so until about the year 1852, when they, too, went to England, Mr. Boggs retiring from the firm. The late lamented James B. Morrow became a partner about that time. It has always been a problem whether the circumstances of the time combine to produce a man who from his connection with them, succeeds in winning a name for himself, or whether an original mind, by foresight and penetration, makes its own surroundings and becomes great of itself. We more readily incline to the latter view, but certain it is, in the history we have been endeavouring to trace, one name stands forth boldly as entitled, himself alone, to all the honour that can be given, for, by his own energy and skill, building up the trade of Halifax, for establishing a steamship company that has benefited the world, and for making himself

THE MODEL MERCHANT AND BUSINESS MAN

for our young men to follow for all time to come, and that name is Sir Samuel Cunard. —*Halifax Exchange.*

A Tramp to the 15 Mile Stream Gold Diggings.

These gold diggings are situated half way between the South Shore and Guysborough road, and eleven miles from Trafalgar Inn, managed by John Nelson, a place where travellers have to stop, and good accommodation for man and beast are provided. Although Mr. Nelson's vision has failed, yet he appears to be able to see as far into a granite rock as those whose eyes are sound. About a mile from Nelson's, you leave the Guysborough road, and with your guide make for the land of gold. When you travel seven miles, you reach a nice little lake that abounds with trout, known as "Dayspring" Lake, after the mission ship *Dayspring*. It was on the bank of this lake that the masts were taken for the mission ship. In 1867 claims were taken up, and quite a large sum has since been paid either for claims or royalty, and yet very little has been spent by the Government in opening up the road. The Government must consider the road favourably, and assist the owners of claims so that they may be able to get out machinery suitable for carrying on their operations successfully ; the present road being simply a path through swamps over rocks and brush wood. Provisions cost one dollar per hundred from Nelson's to the Diggings. Hall Brothers have been crushing for a week, and after cleaning up the battery they realized the nice little sum of 80 oz. of gold. The amount of quartz still to be crushed we would suppose will give twenty thousand dollars, what is already crushed can scarcely be missed from the large pile. Twenty-five men are engaged in the work. The owners had a handsome offer from an American Company, but by some mishap they did not succeed in selling, which I believe is a lucky event for Hall Brothers. They (Hall Brothers) are very quiet and unassuming men, and remarkably kind to strangers visiting their works, as all who are acquainted know. There are five houses. One 1½ storey building, two crushers, comprise the amount of buildings at these diggings at present. Quite a number are engaged prospecting. Claims taken up, besides Hall Brothers, are of great value, such as Morrison's free claim, Shand's, Grant's, Hudson's, Doran's, the Eagle Nonpareil, Holiday's, and Jackson's. These claims have all been prospected, and show richly. Hall Brothers have paid over one hundred dollars royalty in the spring, and a very much larger sum must be paid when they go to Halifax, and all is cleaned up. Many fine sights can be obtained from boulders on the surface. So rich are these boulders that one can make wages breaking them up.

WHILE Mr. Vanderbilt was in Amsterdam recently he purchased, one afternoon, thirteen thousand dollars' worth of blue ware for his new residence in New York.

War—Supporting the Guns.

(From the Detroit Free Press.)

Did you ever see a battery take position ?

It hasn't the thrill of a cavalry charge, nor the grimness of a line of bayonets moving slowly and determinedly on ; but there is a peculiar excitement about it that makes old veterans rise in their saddles and cheer.

We have been fighting at the edge of the woods. Every cartridge box has been emptied once and more, and one-fourth of the brigade has melted away in dead and wounded and missing. Not a cheer is heard in the whole brigade. We know that we are being driven foot by foot, and that when we break back once more the line will go to pieces and the enemy will pour through the gap.

Here comes help !

Down the crowded highway gallops a battery, withdrawn from some other position to save ours. The field fence is scattered while you could count thirty, and the guns rush for the hill behind us. Six horses to a piece—three riders to each gun. Over dry ditches where a farmer would not drive a waggon, through clumps of bushes, over logs a foot thick, every horse on the gallop, every rider lashing his team and yelling—the sight behind us makes us forget the foe in front. The guns jump two feet high as the heavy wheels strike rock or log, but not a horse slackens his pace, not a cannoneer loses his seat. Six guns, six caissons, sixty horses, eighty men, race for the brow of the hill as if he who reached it first would be knighted.

A moment ago the battery was a confused mob. We look again, and the six guns are in position, the detached horses hurrying away, the ammunition chests open, and along our line runs the command, "Give them one more volley, and fall back to support the guns." We have scarcely obeyed, when boom ! boom ! opens the battery, and jets of fire jump down and scorch the green trees under which we fought and despaired.

The shattered old brigade has a chance to breathe for the first time in three hours as we form a line and lie down. What grim, cool fellows those cannoneers are ! Every man is a perfect machine. Bullets splash dust into their faces, but they do not wince. Bullets sing over and around, they do not dodge. There goes one to the earth, shot through the head as he sponged his gun, That machinery loses just one beat, misses just one cog in the wheel, and then works away again as before.

Every gun is using short-fuse shell. The ground shakes and trembles, the roar shuts out all sounds from a battle line three miles long, and the shells go shrieking into the swamp to cut trees short off, to mow great gaps in the bushes, to hunt out and shatter and mangle men until their corpses cannot be recognized as human. You would think a tornado was howling through the forest, followed by billows of fire, and yet men live through it—aye, press forward to capture the battery. We can hear their shouts as they form for the rush.

Now the shells are changed for grape and canister, and the guns are fired so fast that all reports blend into one mighty roar. The shriek of a shell is the wickedest sound in war, but nothing makes the flesh crawl like the demoniac singing, purring, whistling grapeshot, and the serpent-like hiss of canister. Men's legs and heads are torn from bodies, and bodies cut in two. A round shot or shell takes two men out of the rank as it crashes through. Grape and canister mow a swath and pile the dead on top of each other.

Through the smoke we see a swarm of men. It is not a battle line, but a mob of men desperate enough to bathe their bayonets in the flame of the guns. The guns leap from the ground, almost, as they are depressed on the foe, and shrieks and screams and shouts blend into one awful and steady cry. Twenty men out on the battery are down, and the firing is interrupted. The foe accept it as a sign of wavering and come rushing on. They are not ten feet away when the guns give them a last shot. That discharge picks living men off their feet and throws them into a swamp, a blackened, bloody mass.

Historians write of the glory of war. Burial parties saw murder where historians saw glory.

THE London *Telegraph* says that in consequence of the advance in value of many securities held by the Glasgow Bank, the liquidation is likely to show much better results than were at one time anticipated, and those shareholders who have met their calls in full will be handsomely remunerated.

MR. WILLIAM B. ASTOR lately paid one hundred and ninety thousand dollars for the beautiful Parish estate in Newport.

Sentiment in the Sex.

"Women is the weaker vessel." This is an adage which has been ratified by almost universal acceptance and been practically acted upon in all ages and all countries. Paul, when he wrote it, not only gave utterance to an inspired thought but also to a principle that seemed taught and enforced by the very nature of things and the design of the Creator. There have been, however, many of the sex who have loudly protested against the statement and denounced Paul as next door to a misogynist, and an ungallant and ungenerous detractor of womankind, and the question is now more than at any former time the basis of agitation and outcry among the most civilized nations. What then is the true inwardness of the case? Is woman really to hold a divided sway with the so-called Lords of Creation? And if not, why not?

We confess to having a wholesome dread of offending our fair readers if we state fully our convictions on this matter. We shall be stigmatized doubtless by girls of the Boston type as "a horrid creachur, utterly devoid of culchur," and from the very mildest and gentlest of our lady friends we expect at least a remonstrance; but, all the same, truth—or, at least, our convictions on his matter, compel us unhesitatingly to say "woman is not the equal of man nor intended to share his sphere of work, still less to rule with him a "divided empire."

We do not propose to repeat the stale arguments that have been so often used in support of this position, but simply to show that there is one special characteristic of the female mind which conclusively, and once for all, decides the question against the so-called "rights of women;" and this peculiarity is the sentimentality of the sex.

A woman is utterly under the domination of this feeling from her earliest years. She takes naturally to dandling and nursing her doll, as soon as she can walk, and her sentimental fancy endows it with all the characteristics, the wants and habits of a real living child. She pours out the wealth of her childish affection upon it, and in this way indicates with irrestistible truth the true sphere for which God intended woman. Nor is her sentimentality less vividly seen in her riper years. The doll may be thrown aside indeed (though, ten to one, it is carefully treasured in some secret repository to be looked at with tender memories now and again), but she soon finds other treasures to be fondled and prized in its stead. We wonder whether there is a single lady, of our or any other person's acquaintance, that has not treasured up in some carefully concealed *cache*, some lock of hair, some package of letters, some copy of verses that are the merest rubbish in themselves but which are nevertheless in her eyes more precious than silver or gold. The stronger nature of man laughs at the idea of such sentimentality but in woman it asserts itself as an essential element in her nature, and refuses to be expelled either by reason or ridicule. In short, the heart of woman is more susceptible, and therefore her nature is to that extent weaker than that of man, thus indicating her being fitted for another sphere. At the same time we do not call that sphere a *lower* one. On the contrary it is one of great—if not the greatest power and influence in shaping men's characters and ultimately, the history of nations. It would be an interesting matter of research and historical value to reckon up and recount the amount of influence that has been exerted on the world's, great changes and events by those women who did not exert that influence beyond their legitimate sphere, whose sons owed the high and noble qualities by which they won their way to success to the careful instruction and wise training of their mothers, whose husbands had to own that more than half their success in life was due to the wise counsel and cheering influence of their wives.

But for the rougner, harder work of life it absolutely unfits them. It is but too apt to warp judgment and set reason to one side. In the political arena it is a most undesirable factor, and in other departments of man's work (such as law for instance) it is something most likely to interfere with justice for the sake of mercy, and to render "the hand that should strike unable to do more than stroke."

And to this, if it be answered that there have been women who have shown the most eminent qualifications for success in the work usually done by man, let us reply that those who did so must have either got rid of their sentimentality, or else been born without it. In either case they are not the sort of women we should care to have around us.

This sentimentality, then, though it be regarded as a sign of weakness by some, we call a sign of strength, the truest strength with which a woman can be endowed to enable her to fulfil worthily her noble mission, a mission which, be it noted, man could never fully discharge. The care of the home circle, the training and care of the young, are eminently the work of woman, and this need not, indeed should not, exclude the cultivation of intellectual pleasures. She need not be a mere drudge—indeed she must not be if she be desirous of being a real help-meet to her husband—and, in the well-regulated exercise of true sentiment, she will find at the same time her purest pleasures and her best safeguard.

Hunting for Submarine Treasure.

A schooner, owned by a Conneticut "Submarine Company," is being used in exploring a sunken wreck off Round Island, near Peekskill, on the Hudson. The wreck has been there many years, and is reputed to have been the ship of the famous pirate Capt. Kidd. A visitor found among the appliances of the schooner a great variety of machines, chains, pumps, rubber tubes, and other contrivances, for bringing treasure out of deep water. Chief among these was a large diving bell, of boiler iron, with little round windows on every side, so that the man inside can see out in every direction—up, down, and across. It is kept in a well in the hold, and when it is to be used, bolts at the top are unfastened, the top being put on so tight that the affair is both air and water proof. The sensation of being bolted into this narrow iron prison for the first time is said to be terrfble, though the experienced divers do not mind it. There are two rubber tubes attached to the top, one to carry off the exhausted air, the other to supply fresh air. When the man is fastened in, the pump is started, and the bell is hoisted out with an immense derrick and lowered over the side. This bell can operate in three hundred feet of water, and is, of course, raised or lowered by steam. When all is ready it is lowered to the bottom. The man inside looks through his windows, and determines what must be done first. He has wires to pull to signal the men above. He can tell them to hoist, lower, give him more or less air, or any other signals that may have been agreed upon. Attached to the side of the diving bell, and operated by steam, from above, is what is called "the arm"—a heavy attachment, provided with so many joints and swivels that it is capable of making all the many motions of the human arm, with much greater strength than any human arm ever had. This arm has a hand, with fingers, that hold a saw, an axe, a crowbar, or any instrument desired. If the man in the bell desires to saw, he is drawn up, a saw is put in the steam hand, and he goes back and begins work. When he wants an axe or a hammer he is drawn up again, and the tool is changed. The iron bell is almost human in its capacity for work, and, with the brains of a man inside, it is a valuable labourer. When the work is in very deep or dark water, or at night, an electric light is attached to the bell, and the bottom for many yards around is made as bright as if the sun shone upon it. The effect upon the surface of the water of this bright light underneath is said to be dazzling and beautiful, and some of the Rip Van Winklites who live up yonder on the hills may well begin to wonder when they see the bottom of the Hudson bright with electric light and a steam man digging for a pirate's treasures.

It is said of Darmstadt that it is the healthiest spot on the globe. Nearly all the inhabitants die of old age, or when they get tired of life move to Munich, where they are sure to drop off in a very short time. "But it is all a mistake," said a poor and tearful peasant to his doctor: "Darmstadt has not a healthy climate, for I had a cousin who resided there, and he suddenly took sick and died." "And what was his disease, my friend?" asked the astonished doctor, looking over his gold bowed spectacles. The peasant thought he proved his assertion that the climate was unhealthy by replying. "Why, he died of delirium tremens."

It occasionally happens that a man tells the truth when his real object is to tell a lie. An Italian, unfamiliar with the English language, used to sell fish on the streets, using the usual call—"Freshee fishee, all alive!" After a while he retired from the fish business and took to selling eggs, using however, the words—"Freshi eggs, all alive," densely unconscious that he is not telling the lie he thinks he is.

Fiendish Fury.

HORRIBLE BUTCHERY OF A VIRGINIA WOMAN BY HER BROTHER IN-LAW—THE WRETCH'S ATTEMPT TO TAKE HIS OWN LIFE ABLY SECONDED BY HIS WIFE.

At Richmond, Va., intelligence has been received here of one of the most desperate and bloody crimes known in the history of murders, and one which shows how strongly hatred animates a human being even in the hour of death. The tragedy took place yesterday, near the village of Green Springs, in London county. It seems that Merrill Nott yesterday morning early had a quarrel with his wife's sister, who lived in the house with him. Thoroughly infuriated, he went out and got a large knife used for cutting corn, and, coming back, assaulted her with the murderous weapon. He pursued the unfortunate woman into the yard and stabbed and hacked her until he thought she was dead. After this he went into the house, and, taking his gun, discharged it into the air. He then reloaded the weapon, and, proceeding to within a few feet of where his victim lay weltering in blood, placed the muzzle of the gun under his own chin and fired, the load passing through his mouth, tearing of the tongue and lodging in the upper part of the jaw. He fell in his own gore, and while struggling on the ground gasping for breath he noticed signs of returnturning life in his dying sister-in-law. Summoning the full strength of every muscle and concentrating the whole of his vital forces in one almost superhuman effort, and even then struggling in the throes of dissolution, he crawled about on the ground until he reached a large stone, which he caught in his clammy hands, and then, wriggling his distorted body over the ground with almost worm-like motion, he dragged it to the side of the dying woman, and, lifting himself, he raised the stone as high as he could and let it fall on the woman's face. It crushed in the skull and nose of the woman, but she still struggled. The dying scoundrel, with a determination which did not leave him in his last moments, reached out again for the rock, with the design of dealing another blow. At this stage of the tragedy his wife appeared in the yard, and, seeing him reaching for the stone, seized another, and, standing over his body, dealt him a death blow, but too late to save her sister, who died in a few minutes after her murderer. It is not known what caused the quarrel between Nott and his sister in-law, but it is understood that he and his wife had also been quarreling, and that his sister-in law simply took his wife's part.

At the Mercy of the Waves.

MEN LEFT IN MID-OCEAN CLINGING TO A SINKING SHIP'S MASTS—THE FRUITLESS ATTEMPT OF THE CALIFORNIA'S MEN TO RESCUE THEM—DISAPPEARING IN THE NIGHT—A POSSIBILITY THAT THEY HAVE BEEN SAVED.

The three hundred sixty-five cabin and steerage passengers which arrived in New York yesterday on the Anchor line steamship California saw a thrilling spectacle in mid-ocean. When four days out from London a bark was seen in an apparently sinking condition. The sea was boisterous, and the crew, clinging to her shrouds, waved their hands in appeal for help.

Capt. Donaldson of the California brought his ship up into the wind.

"Hardie," he said, calling to the first officer, "lower the big cutter and try and get to her."

Hardie, a veteran mariner, lost no time in clearing away his boat, which, manned by a hardy crew, was soon in the huge seas that had been generated by a fierce northeaster.

Officer Hardie says that, with great exertion, he succeeded in getting to leeward of the bark, which was tossing about helplessly in the trough of the sea. After many attempts his crew got the end of the line which had been made fast to a broken spar and thrown overboard by the bark's crew. His boat was pitched up and down on the seas as though it had been in the surf, and before he could approach nearer the line parted. Many of the crew in the rigging seemed to have their dunnage strapped in the rigging, and they did not respond to his appeals to them to jump overboard. By their signalling he learned that the bark was the Macedonia, from Pensacola, Fla., for Berwick, England. She had ten feet of water in her hold, and was leaking badly. The day was waning, and a thick haze was setting in. So much difficulty had Hardie and his crew experienced in reaching the sinking bark, and such a tax upon the strength of his crew had it proved to keep their boat head to the sea, that he finally decided it would be fatal to all hands to remain longer away from the steamship, which was fast becoming indistinct. Before returning, however, he made a final effort to get the men in the shrouds to jump overboard. This they seemed loth to do. Their ship was lunging about in the seaway, the waves making a clear breach over her. It would have been fatal, he says, to have approached her. Had he touched her rearing sides his boat would have been crushed. This was the reason, he says, that he was finally compelled to sheer off and make for the steamship. His men were so exhausted when they reached their ship that they had to be lifted aboard by a fall and tackle.

Capt. Donaldson decided to stay as close as possible to the sinking ship and make another attempt at rescue in the morning. When darkness set in a white signal light was seen on the bark, and a red light was shown aboard the steamship in response. The gale continued all night, and in the morning the sinking bark was not in sight. After describing a great circle with lookouts in the tops, without seeing anything of the bark, the California proceeded on her way hither.

The officers of the California are of the opinion that the bark was settling very slowly into the sea. They say she was, when last seen, dissectly in the track of passing vessels, and they think the crew may have been rescued. The bark was last seen in latitude 48° 47′ north, longitude 21° 57′ west.

The bark Macedonia was commanded by Capt. Parker. She was built at Bath, Me., in 1845. She was 125 feet in length, 27 feet beam, 19 feet depth of hold, and of 476 tons register; Her owner is M. Thompson, of Newcastle, England.

How to Have Ice Next Summer.

A great many people do without ice in the summer—though the ponds and streams at their doors furnish an abundant supply every winter—simply because they imagine that an expensive icehouse is needed to hold the ice. A gentleman who once laboured under the same delusion, describes in the *Tribune* the experience by which he was led to store his summer supply of ice successfully, without an ice house, after paying dearly in disappointment, loss of ice, and loss of money, through having "too much icehouse." He was convinced of his error by the circumstance that the more pains he took with his icehouse the more rapidly his ice melted, while a neighbour who had no icehouse at all always had plenty of ice. The practice of the latter was simply to pile his ice in a square body under a cow-shed having a northern exposure, the first layer of ice being raised above the ground so as to secure good drainage, and the whole covered thickly with sawdust. Boards set on end around the ice pile served to keep the sawdust in place. The gentleman referred to says:

A pile of ice six feet high, and eight feet long will make three hundred and eighty-four cubic feet. And this is enough for the use of an ordinary family for the table and to cool the cream etc. Six team loads fill an icehouse which contains about four hundred cubic feet. The blocks should be cut as smooth as possible and square, so they will fit closely, and then ice must be chopped up fine and crowded in between the pieces so as to make a solid mass. The closer the ice is packed, and the more solid the mass is united together, the better it will keep. When an icehouse is too close, there is a great deal of condensation, which makes the whole contents wet and dripping, and causes the ice to melt rapidly. The air must be kept as dry as possible, one secret of keeping ice being plenty of ventilation. The more ice there is in a pile the better it will keep. A small quantity must be covered deeper and thicker than a large mass. A large mass will almost keep itself. It does not require the protection of sawdust, but straw or a double wall of boards will be ample. Every person who makes butter ought to have ice. It will more than pay for use in the dairy, and then for the family it is a luxury every provident man should supply.

Dr. Graham of Louisville, in his 97th year, has gone on his regular annual hunt in the mountains. He says that every autumn since 1830 he has eaten venison of his own killing and cooking.

The Gatineau.

We continue the description of the mills on the Gatineau River. The principal are the Gatineau Mills, belonging to Messrs. Gilmour & Co., situated at the village of Chelsea, about eight miles from the city of Ottawa and nine miles from the junction of the Gatineau with the Ottawa river. The scenery above and below the mills is exceedingly romantic and beautiful—four or five rapids and cascades, and sloping banks to the water's edge, covered with trees and foliage, render this portion of the river most picturesque and charming. The mills are situated on the south bank of the Gatineau, above the high falls, and are surrounded by a series of booms and works of great magnitude upon which immense sums have been expended. The whole of the saw-logs which descend the Gatineau are caught in these booms, and a very faint idea can be conveyed to a stranger of the immense amount of skill required to separate those belonging to the Gatineau mills from those belonging to different manufacturers below.

During the summer this point of the river presents a scene of bustle and animation of the most extraordinary kind, and as the firm employs literally an army of workmen, the scene can be better imagined than described.

Below the booms, the worst point of the river has to be encountered by the logs descending the stream, and it is frequently enlivened by the appearance of perfect islands of stranded timber, technically called *jams*, and the efforts of the owners to set them afloat exhibit scenes of daring and endurance seldom witnessed elsewhere.

The mills were commenced about forty years ago. They now consist of two large, substantial buildings, and a smaller mill for preparing lumber for the United States market. The water power used is equal to about five hundred horse power. There are 13 saw gates containing about 220 saws; and twenty edging, buttoning, and re-sawing circular saws. These mills will manufacture 230,000 feet, board measure, in eleven hours, or about 35 million of feet per season. About two thirds of this lumber is cut for the Quebec market, and the balance for the United States. Attached to the mills there are about three miles of wooden canal for conveying the sawn lumber to the piling grounds. Messrs. Gilmour & Co. possess timber limits to the extent of 1,700 square miles, whence they obtain the requisite number of saw-logs to supply these extensive works. and 1,000 men receive employment from them during winter and 500 in summer, including lumbermen, farmers. surveyors, &c., &c. They also employ 250 spans of horses; and during each season they consume 40,000 bushels of oats, 600 tons of hay, 1,500 barrels of pork, and 3,000 barrels of flour, besides large quantities of clothing, boots, shoes, tea, tobacco, blankets, &c., &c., &c. These mills are amongst the most celebrated in the country, not only for the romantic beauty of the surrounding scenery but for the perfection of the machinery employed and the order and good management exhibited throughout them.

On their limits this firm has nine farms, comprising in all about 1,500 acres. The whole of the produce of these farms is consumed by the employees of the firm. On the banks of the river Gatineau they have four principal depots, from which supplies are sent to lumbermen at work in the woods. One of these is distant upwards of 200 miles from Ottawa. This firm pays from $275,000 to $300,000 in wages annually.

Pickanock Village.

This village is situated in a valley at the mouth of the Pickanock river, distant from Ottawa sixty miles. It is one of the many romantic spots on the Gatineau. The founder of the village, Mr. J. Ellard, is proprietor of the grist mill and saw mills, which were built by him in 1862. The country around Pickanock abounds in minerals, such as phosphate, iron, lead, &c., with indications of gold and silver.

—Coal in Winnipeg is quoted at $18.50 to $19 per ton.

—It is semi-officially announced that the Ontario Legislature will meet on the 13th January.

The Victoria Farm.

About a mile above Pickanock village is Victoria Farm, the principal depot of Messrs. G. B. Hall & Co., whose mills are at Montmorenci, near Quebec. The farm, according to a correspondent, comprises 700 acres, 400 of which are under the most perfect cultivation, under the charge of Mr. R. Bowden, who also looks after the stock, which is unsurpassed on the Gatineau, and comprises 35 horses, 26 head of cattle, 55 sheep, 16 pigs, &c.; among these fine animals, is a magnificent bull, which though only 3 years old, weighs 2,030 lbs., and a handsome stud. The farm is also provided with a large vegetable garden, in which are to be seen grapes and other fruits and a variety of flowers. The products of this farm last year amounted to over 200 tons of hay, 5,000 bushels oats, 6,000 bushels turnips and 3,000 of potatoes. The buildings are perfect and all the most improved agricultural implements, are in use; 12 labourers are employed who reside on the farm. Attached is a general store, and the offices which are connected with Ottawa by wire; 3 clerks are engaged attending to the directions of Mr. Fisher, the general agent and the foreman of the other farms, or depots, which are five in number, and are situated at various points north on the tributaries of the Gatineau. From six to seven hundred men are employed directly and indirectly by this large lumbering house.

The Desert.

This village, so called from the River Desert emptying, in to the Gatineau, where it is built, is also called Maniwaki. It comprises a mixed population of nine hundred inhabitants, viz: about 500 English and French speaking, and 400 Indians. It is situated ninety miles north of Ottawa city. In the neighbourhood are four depots belonging to Messrs. Gilmour & Co., G. B. Hall & Co., Hamilton Bros., and Mr. Chas. Logue.

Hawkesbury Mills.

This extensive establishment owned by Messrs. Hamilton Bros., has been established for over three quarters of a century. The first firm was Hamilton & Low, who commenced work cutting logs on the Gatineau in 1805. They first began about 20 miles up the river, they have year by year pushed their business northward until they now operate 110 miles above the Desert—own 920 square miles of limits in the Gatineau district and have five large depots connected therewith 30 miles apart. The number of men employed there varies in the aggregate from 150 to 300; this is but a small portion of the business of the tributaries of the Ottawa, among which we may mention the *Rouge*, Desert, *Gatineau*, Jean-Deterre, Ignace, Crow and DuMoine Rivers; in the latter district they own 850 square miles of limits and employ 400 men, and on the Rouge over 100. The total number of men employed in the woods to get out saw logs —the only timber made for the firm's mills—which are situated at Hawkesbury, will average about from 600 to 1,000 annually.

The Mills are situated about sixty miles from Ottawa city, on the south shore of the river, near the head of the Grenville Rapids. They contain 101 vertical saws and 44 circular saws, driven by 72 water-wheels, and turn out from 35,000,000 to 42,000,000 feet of lumber per annum. About five hundred men and boys are in summer employed constantly by the firm at Hawkesbury alone. Some conception of the immense extent of the operations of this firm may be formed when we say that more than 3,000 tons of agricultural produce are consumed annually.

The establishment includes four saw-mills, together with a grist-mill, with four runs of stone, for the production of flour for the use of the raftsmen, shantymen and other employees, as well as for the neighbouring farmers.

The present firm is composed of Hon. John Hamilton, Robert Hamilton, and John Hamilton, Jr. The chief business office is at Ottawa, under charge of Mr. Hiram Robinson.

MINING NEWS.

The Brockville *Recorder* says, a mineral spring has been discovered near Morristown.

An offer by an American gentleman of $3.75 per ton for 40,000 tons of iron ore delivered in Ottawa has been refused by Col. Robbins.

Moore & Cutler's timber limits on the Mattawa, 133 square miles, were sold recently at Ottawa, by J. Brewer, auctioneer, to J. R. Booth, for $30,100.

A party of miners returning from the interior of Alaska and the head waters of the Yukon river, report finding numerous gold deposits and indications of rich placers.

The Renfrew *Mercury* says: Two men are hunting up minerals in the mountain ranges of Litchfield. One of them carries the bag and specimens. Among the specimens is a beautiful piece of marble got in the neighbourhood of Renfrew. Equally as good can be found in large quantities on this side of the river.

THE PRICE OF PHOSPHATE.—The price of phosphate on the canal is now about $12 a ton, and the demand, we are informed, is more than equal to the supply. This is a good paying figure, and the output should be large this season.—*R. Mercury.*

The discovery of a gold nugget weighing six ounces is reported from the Delery concession, River Gilbert. Mr. Delery has formed a new company to work the precious metal under the name of the East Branch Gold Mining Company.

During the past year over one thousand immigrants have been registered at Ottawa, all of whom have obtained work in the Ottawa valley. Since the 1st of January 120 settlers, with effects valued at $10,513, have moved into Ottawa. For the previous year the value was $5,878.

A citizen of Ottawa has gone to New York with samples of sand found up the Ottawa, and supposed to contain a very large percentage of gold. The object of his visit is said to be to negotiate for either the sale of the property on which the sample was found, or to organize a company for its development.

A French paper says, that Mr. J. Ainsworth, proprietor of lot No. 13, Concession DeLery, in Beauce, has realized something like $200 a day for some time past. He employs constantly some 35 men. A day or two ago one of the workmen on this lot found a nugget valued at eighty dollars.

The gold mining property owned by the estate of the late Alexander Heatherington, and situated at Cariboo, East Halifax, was sold by the sheriff recently and purchased by S. R. Jenkins for $4,000. The property includes sixty-seven gold mining areas, one hundred acres of land, and buildings and machinery.

The following interesting news comes from Ottawa:—

Hon. R. W. Scott and Mr. W. H. Walker, Ottawa, have been in New York city for some time past negotiating for the sale of the Canada Plumbago Company's mines and works near this city, on the Quebec side of the river. After many false alarms, success appears ultimately to have attended their mission. Mr. Walker, who has returned from New York, states that a new company with $300,000 capital has been formed in New York to manufacture a new economic material of which plumbago is the principal ingredient—in fact to the extent of 76 per cent. Patents have been obtained for it in the principal civilized countries. The company consists of prominent financial men, and the paid-up capital amounts to $93,000. At a meeting of this company held in Cooper's Institute, the terms of the sale of the mines were agreed upon, subject to the Treasurer's approval, who was then in France negotating the sale of the patent for the new material. He expects to realize $300,000 for patent. The terms of the sale appear to be that Mr. Walker retains one-half interest, while the American company takes the other half. The company are to take the plumbago at ruling market prices. About $800 per ton will be paid for the refined plumbago. Fifty men will be employed on the works at Buckingham, and will work in night and day gangs. The new material appears to be lubricating in its character, as it does away with the use of oil on machinery. As to the other proprieties secrecy is maintained at present.

From Oxford County, township of Blenheim, Ontario, a Drumbo correspondent of the Paris *Star* writes that a large bed of iron ore has been uncovered on the farm of John Burgess, within a quarter of a mile of the village. There is only about a foot of soil covering it. The soil was taken off by shovels, uncovering quite a large spot, and the ore lies there in a bed and seems to run downwards from the point and over to Henry Muma's farm. There had been some persons acquainted with the fact for some time, but only now and then picked up small specimens; but now the actual bed has been found, it will not be any trouble to trace the vein. A gentleman who examined it says it very much resembles the ore taken from the Londonderry mines in Nova Scotia. Here is a chance for capitalists to take hold of, as it is within a quarter of a mile of the Grand Trunk and Credit Valley railway stations, and there are excellent advantages for shipping.

600,000 Barrels of Petroleum Wasted.

Since midsummer there has run to waste in the Bradford oil region something like 600,000 barrels of petroleum. A recent dispatch from that region says that there are in round numbers nearly 8,000 oil producing wells in the Bradford district. Their daily yield is 70,000 barrels. The lower or old oil fields are producing 12,000 barrels a day. The daily demand for petroleum is 55,000 barrels. This is the amount now run by the pipe lines. The accumulation of oil for which there is no present demand long ago exhausted the storage capacity. For three months 6,000 barrels of oil have been running to waste every day. There are 2,000,000 barrels of petroleum in wooden tanks at the wells. It is estimated that there are at least 8,000,000 barrels of accumulated stocks in the storage tanks of the pipe lines. The oil that is running to waste is run upon the ground and into creeks. Enterprising individuals build dams along these streams and collect the floating "grease." Hundreds of barrels are pumped off and stored in improvised tanks to await a market. Individual producers are building private tanks to store the overproduction. There are now 400,000 barrels of this tankage in this region. The number of wells steadily increase every month, in spite of the situation.

The Bradford wells are all flowing wells. This fact is what caused the abandoning of so many of the wells in the lower field, they being all pumpers. Until recently the "sucker rod" and pumping engine were almost unknown in the Bradford field. Now they are in demand. Many of the old wells have fallen off greatly in their yield. The supply companies cannot furnish enough sucker rods and engines to meet the call for them. Second-hand ones from the lower field find a ready market at good prices. This resort to the pump is creating no little uneasiness in the field. It indicates that the gas is failing. A flowing well on being pumped increases its yield largely; but the continuance of a full yield becomes uncertain. The positively defined area of the Bradford oil producing field includes over 65,000 acres. There is a well to every 5 acres of land that has been developed, which leaves about 30,000 acres yet to drill. Wells on this territory will not be put down with such reckless haste as has characterized past operations, because it is controlled by large companies of capitalists.

THAT exquisite monument of ancient Irish art, the Tara brooch, more delicate than the finest Etruscan work, was sold by the finder to a Drogheda goldsmith for $1.25.

THE London journals continue their commendations of the improved arrangement recently devised for starting cars and assisting the driver to brake up. This plan, which differs from others brought forward for a similar purpose, consists of a system of coiled springs, levers and gearing, placed at the end of each car under the framing, the springs being connected by means of a cross-head and chain, with a loose drum and clutch gearing working on the axle on which the car wheels are fixed. When the signal is given to the driver to stop the car, he releases a lever, which throws a fixed clutch into gearing with the loose drum, to which the chain is attached; the drum then revolves with the axle of the car and winds up the chain, thus causing a retarding force to be exerted on the wheels by reason of the springs being compressed. On receiving the signal to go on the driver releases the clutch from the drum, and the springs, having thus free play, unwind the chain from off the drum; in so doing, the drum, and with it the axle of the car, is revolved in a forward direction, which gives an impetus to the cars.

Armed Peace in Europe.

Plots and Counterplots of the Powers —Greece Preparing to Claim her Provinces—Germany Desirous of more Allies—The Fortifications of Paris—The Russian and Chinese Armies.

PARIS, Nov. 12.—Those who are behind the curtain assert that February will not pass without bloodshed on an extensive scale in Epirus and Thessaly. There was every reason to anticipate this bloodshed six months ago, and yet there was none, because diplomacy hoped to frighten the Sultan by threats which diplomats assured him privately should not be executed, and I would be inclined to think that nothing more serious need be feared for 1881 if it were not for two circumstances: First—The Greeks have managed to raise a loan of sixty millions, which they are spending entirely upon the armament and mobilization of their national forces. Second—Although the Sublime Porte pays none of its creditors either at home or abroad,

"THE PALACE FLOATS IN GOLD,"

to quote literally the expression of an Oriental banker to me last evening. That this money should have been furnished to the Greek and Turkish Governments, both notoriously insolvent, is a symptom of trouble ahead, and, if my information be correct, the subsidies can be traced to Berlin on the one hand and to London and St. Petersburg on the other. The catastrophe is certain; when it will come depends entirely upon the good pleasure of Prince von Bismark, which in its turn depends upon the success of his present intrigues to draw France into the Austro-German orbit. Monstrous as this alliance would be, it is not at all an impossible eventuality. Just now such a compact would overthrow any Government by which it might be proposed, but the mere circumstance that some very respectable men have begun to discuss its possibility, to estimate the nature and extent of the *quid pro quo* to be demanded, is evidence of a wish to feel the public pulse. That the maintenance of quasi-cordial relations between

RUSSIA AND GERMANY

depends entirely upon the existence of their sovereigns is generally admitted, and the news concerning the Czar's health is of a nature to cause legitimate apprehensions. The official reports, of course, represent it to be blooming, but private letters speak quite in another way, and it is certain that the most eminent physicians of St. Petersburg were telegraphed for last week to consult with his majesty's ordinary medical attendants at Livadia. The report is that dynamite and revolvers having proved of no avail, arsenic has now been resorted to, the utmost secrecy is prescribed to the press, but the correspondents of foreign journals tell queer stories of perquisitions made in the imperial kitchens and of the arrests of several of the imperial cooks. Something of the sort must have been the cause of the precipitation with which the morganatic marriage with

PRINCESSS DOLGOROUKI

was celebrated. I have already noticed this affair, and, I think, stated how there was even question, at one moment, of having a right-handed instead of a left handed ceremony, for which there was a precedent in the case of Peter the Great. Mme. Dolgorouki had quite enough influence over her august lover to obtain this had she elected to wait awhile, but, being a clever woman, she appreciated that delays may be dangerous, and so preferred the lesser honor by which her children are legitimated and her own very equivocal position as favorite rendered respectable. Although I wrote about this marriage more than a month ago, the French newspapers have only just published it as a fact, and have only just begun to make their commentaries, while but three days ago did even the Cologne *Gazette* obtain full details. The ceremony was performed on the 1st of last August in a chapel of the Palace, in the presence of a very few witnesses, among whom where the Grand Duke Nicholas, who will now, as a reward for his condescension, be probably restored to favor, and the Minister of War, Gen. Miljutine. All the imperial family except Nicholas testified their disapproval by their absence. The Czarewitch went away to Hapsal, the Grand Dukes Constantine and Vladimir came to Paris, the latter accompanied by the Grand Duchess, the former with the mission to bring home the yacht Livadia.

Now, being posted better than even the Russians themselves on these

IMPERIAL FAMILY JARS,

knowing the intense hatred of the Russian Crown Prince for everything German, whether on the right or the left bank of Vistula, and feeling that the precarious state of the Emperor's health offers little assurance of any long duration to the *Statu quo*, Prince von Bismarck casts about him for another alliance. He has no great confidence in the value of the Austrian Army, and he is very much afraid of the French Army, which, if very deficient in many respects, has immensely improved in quality since 1871. He does not propose any compensation as the price of a French alliance, he has no intention ever to propose any compromise, but follows up his old game which was so successful with that imbecile, Napoleon III., in 1866. Meanwhile, he hints to the German people that the French clamor for reprisals is understood—this in order to make a war with France, if needs be, popular in Father land—and he lets the French know that he is in possession of all the details of their offensive resources.

An article, published some months ago, anonymously, and which I then translated told the French and the Germans what both might expect in the matter of field operations. An article in a recent number of the *Berliner Tagblatt* shows the opinion of German strategists concerning those fortifications which our people fondly hoped would render Paris impregnable. The fortified *enceinte* embraces an extent of about 116 square miles; this is judged to be too great to allow reciprocal support between the detached forts, and to organize a solid defence of the intermediate ground where there must be necessarily a great many sectors without fire, through which attacking columns may penetrate and take the positions in rear.

THESE VULNERABLE POINTS

have an average breadth of about five miles, and being in covered ground, they are especially favourable to the assailant. Such, for example, is the ground between the railway lines of Lille and the Soissons, and on the south, between Paloiseau and Villeneuve. As to the guarantees offered by the new works against the investment of the capital, I must agree with the *Tagblatt* that they are totally insufficient. The last siege proved that to isolate the capital entirely was impossible; by means of carrier pigeons and balloons communication could always be kept up with the Provinces, but the alimentation of the town is no easier now with the new system than it was in 1870-71. A zone of 116 miles can only be provisioned by means of railways, and the first operation of an enemy must naturally be the destruction of this means of communication. In 1870-71 neither the French nor the German Armies, with very rare exceptions, destroyed either the tunnels or the viaducts; in the next war both will act differently, and if, from time to time, a few wagon-loads of flour and a few droves of oxen can be introduced, neither will be in sufficient quantities to relieve the wants of the garrison and the population of the beleaugered city. Besides these objections, on which the German newspaper lays great stress, there is another, equally important, but of which, strangely enough, it makes no mention; the great development of the line of defense will subtract a considerable proportion from the troops, which otherwise might be employed in offensive operations. I do not believe that

ANOTHER SIEGE OF PARIS

is probable in our time, but if it should come off, and France rely for her salvation upon the assistance of her capital, the finale will be the same as nine years ago. The only difference will be a prolongation of her agony. Not that I believe France to be foredoomed to defeat in her next struggle with Germany. The French Army is second to none in the military education of its rank and file. Up to the grade of General of Division its officers are excellent; but I cannot see where the country is to look for a chief capable of of directing the *ensemble* of operations. The manœuvres have formed the soldiers, but the absence of all initiation from the operations of brigade and division commanders which is enforced by the programmes of these manœuvres leaves everything, as it used to be, in the hands of the Commander-in-Chief, who may be another Bonaparte, but who may be a fool. Red tape is the curse of the French Army just as much now as it was ten years ago, and if red tape, routine, and tradition be not demolished when this Army next takes the field, the results will be as disastrous as they were when it was last called upon. If they be swept away, the capture of Berlin and not the capture of Paris will be the crowning glory of the war. Which of the two courses may be followed no living man can foretell.

Meanwhile

RUSSIA IS ARMED QUIETLY,

and although her pretended object is the subjection of the Turcomans and the defense of her Kuldja frontier against the Chinese, it is not possible to admit that either of these enemies can cause her any grave anxiety. The late Russo-Turkish war was an admirable school for her officers; they made grievous mistakes there, but they learned some very wholesome lessons, and when we look at the development of her Army during the last quarter of a century, we must admit that those who affect to despise her military strength are woefully blind. On the 1st of January, 1853, the Russian Army was composed of 27,716 officers, 968,382 men inclusive of the reserve, the Militia, and the auxiliary troops, and 78,144 Cossacks. During the Crimean war these forces were considerably increased, and according to official data, amounted, on the 1st of January, 1856, to 41,817 officers and 2,275,454 rank and file. This strength was, however, only nominal; on paper, the effective was: Active Army, 24,654 officers and 1,170,184 soldiers; reserve, 7,876 officers and 572,158 soldiers; irregular troops 3,640 officers and 168 691 soldiers; Militia, 5,647 officers and 364,421 soldiers; Cossacks, 3,441 officers and 156,726 soldiers; for service, subtraction must be made of about one-half of these figures, as in 1863, for example, according to the Ministerial report, the Russian Army only counted 858,997 regular troops, and a conscientious examination of the muster rolls a few months later showed that the genuine effective of the Army did not exceed the approximate figure of 385,000. Since then, however, the military administration of the Empire has been thoroughly reformed, the

ARMY APPROPRIATIONS

have been increased, and there is every reason to suppose that the estimates made on the 25th of November, 1879, are not very far from being accurate. These estimates give, as ready for immediate mobilization, 908 Generals, 31,414 officers, and 865,425 men of the regular Army, 742,144 reserve, 1,972 officers and 51,359 men belonging to the Cossacks, 105,946 irregulars. That Russia can keep up such an establishment as this for any length of time is not to be expected, as it is not to be expected that she destines its employment solely in Central and Eastern Asia, where 30,000 men are spoken of as the maximum of both armies of operations, of which about one-third are thought sufficient for the first operation against the Celestials. Possibly Russia may make a mistake in that quarter, where a declaration of war will immediately follow the completion of the Trans-Siberian Railway.

It is hard for any one to think of

JOHN CHINAMAN AS A FORMIDABLE ENEMY.

What warriors could be thought formidable if dressed in petticoats? Yet the heathen are extraordinarily brave, or rather, they have a contempt of death and danger which, as they can readily bring a million of men into the field, might make them exceedingly dangerous if they were disciplined and commanded by intelligent officers. Fortunately for Russia, they are not, but, unfortunately for that power, they have been deserted by that "big medicine man," Gordon, who, on leaving the flowery land, has bequeathed them a series of military precepts, *vide* his book, which would insure the discomfiture of any army and the conquest of any nation with whose military direction he may ever be connected. From this warlike missionary's exit from China, I presume that he and the Mandarins did not pull together, wherefore they will probably be deaf to his sermons, all the more that a goodly number of German officers have gone to take his place. If they had a year or two in which to work, these gentlemen would doubtless accomplish something; but they have barely time to overcome the two great defects of the Chinese Army, the absence of all unity and centralization. With the exception of the Guard, which is under the command of the Minister of War, all the troops depend upon the Provincial Governors, by whom they are organized, armed, equipped, and drilled according to the instructions of a special Ministry. This is the cause of the first of these two defects; the second is the result of their organization, which is local. Each soldier must provide for his personal wants and for those of his family, and consequently hires himself out as a day laborer.

HE IS DRILLED OCCASIONALLY,

but so rarely that his military education never gets beyond the most elementary rudiments. As to his armament it is heteroclite; bows and arrows in some place, matchlocks in others, and nowhere dangerous for European troops. Their officers have no idea of the art of war, and are ignorant even of the disposal of their troops for an engagement; the examination which they pass must demonstrate only their ability to use the bow on horseback and to play like jugglers with weighing 50 pounds each. 1878 China attempted the introduction of European reforms into her Army. She purchased 275 heavy guns and 250 field pieces from Krupp's foundry, but no teams were procured either then or since, and her artillery corps has not yet been organized. Perhaps it was not on this account that Col. Gordon advised his friends "Not to bother themselves with cannon which make more noise than they do harm, but to put their faith in rockets." (?) In short, the Chinese Army can scarcely be said even to exist on paper. It is a horde of individuals, cruel and sanguinary bandits, who will burn and massacre, but are incapable of opposing any serious resistance to the Russian forces. I need not tell of the worthlessness of the Celestial Navy, which is only worthy of a place by the side of the Celestial land forces, and yet if China should ever resolutely undertake the military organization of her immense population what a redoubtable enemy she might become. Luckily for Russia and her neighbors, such is not the situation.

GENERAL.

TRANSLATIONS of Mill, Spencer, and Darwin are common in Japan, where the "Origin of Species" has a large sale.

MOODY and Sankey spent eighteen days in Salt Lake City, on their way to San Francisco, holding crowded meetings daily.

A BROTHER and sister have become husband and wife, at Youngstown, Ohio. Learning that they were to be prosecuted, they have fled together.

So many persons have committed suicide by jumping off the three bridges across the Tiber at Rome that a philanthropical society keeps boatmen at each bridge in order to rescue the unfortunate.

THE people of Chicago handled and packed 2,875,000 hogs during the summer salting season, from the 1st of last March to the 1st of this month, and yet found leisure for literature and arts. Now they are immersed in their winter packing, and still easily combine pork with politics and poetry.

IN France many professors of the art of cooking feed a family for so much a day and an additional sum for each guest. They bring the provisions, submit a menu, which may be changed, and send a cook to live in the house. At a dinner party they or their aids superintend. They are answerable for the cook.

JAPANESE paper air cushions are said to have some advantage over those made of rubber. They may be rolled into a package of smaller dimensions, when not in use; they will not stick together as rubber does after it is wet, and for pillows they are better because they have no odor. Their strength is marvellous; a man weighing 160 pounds may stand upon one without bursting it. They are said to be waterproof, and to make excellent life preservers.

THE Earl and Countess of Fitzwilliam are passing the winter in Ireland at their beautiful seat Coolatin, in the romantic county of Wicklow, among a tenantry by whom he is much beloved. His tenants are in a most prosperous condition, and the maxim that property has its duties as well as rights is fully carried out. Mr. Parnell's property is close by, and though not at all illiberally managed, his tenants are not all in the same prosperous condttion.

WHEN Napoleon formed the Legion of Honor there was much discussion as to the colour of the riband. Napoleon was for white, probably because on state occasions he loved to dress in scarlet, and saw how happy the colour contrast would be. It was represented that white was preeminently the colour of the exiled house. He then suggested red, and was met with the objection that red was the revolutionary colour. But remembering that blue was the colour of most of the uniforms in the army, and that red would answer as a contrast, he said, "Let it be red."

The Guitar.

The guitar is but little used now in England, though at one time it was very fashionable. Other nations who still employ it, call it by several names, most of which will be described hereafter. The guitar. is rarely, if ever, employed as an orchestral instrument, but is very valuable as a portable means of accompaniment.

The existence of frets upon the guitar limits the number of modulations capable of being performed in the normal tuning. When it is desired to make a complete change of key the *cado tasto* screwed over the finger-board alters the tuning at any desired point, or a temporary change is made by the *grandebarre*, that is by laying the forefinger of the left hand completely over the strings, the remaining fingers being engaged in stopping a chord. In the classification of musical instruments it is convenient to speak of three general sorts, wind, string, and pulsatile. The guitar belongs to the second kind, and may be said to represent a very large family universally distributed, bearing a variety of names according to the tongue of the nation by which it is used. All instruments may be considered as belonging to the guitar family which poseess a resonance body or sound box, together with a finger-board, against which the strings with which they are furnished may be pressed or stopped.

Following the course of history, we find that instruments of the guitar kind are of great antiquity, as well as of general use by people of all nations.

The kinner and nebel, mentioned in the Bible, were stringed instruments, of the guitar or harp family, but of their exact nature it must be confessed little is known, though much is conjectured.

The Egyptian frescoes and other paintings, valuable as showing the frequent use of musical instruments, include several specimens of the harp and guitar family. The Nefer, one of the latter class, had a neck. sometimes with a carved head, and was furnished with three strings, and had a resonance box. Upon the neck, or finger-board, frets were tied or fastened, as in the modern guitar. Each string is said to have been able to produce two octaves.

The three strings were supposed to correspond with the seasons of the Egyptian year.

Grecian writers, describing Egyptian instruments, do not afford much real information concerning them, and all attempts to reconcile their statements only lead to confusion; for conjecture is nst conviction Too moch trust has been placed in the accuracy of sculptured and painted images, and various theories have been founded upon the character of musical instruments as deduced from their represented forms. As with ancient, so with modern musical instruments of far-away countries; travellers' tales have too often been trusted, and their statements received as conclusive, when in the mojority of instances they are confessedly ignorant of the subject upon which they give "authoritative judgment."

Philology does not, after all, furnish the best assistance towards determining selationships in this matter, and, as a rule, the picture of an instrument offers but a little help or guide in the matter. Refrences of musical instruments by the poets of several ages offer no aid whatever, but on the contrary, often tend to mislead. If they were trustworthy, it might reasonably sssumed that no other instruments but the lyre and harp were ever employed to "assist the muse." But colloquial terms—often despised by classical poets—are of most value to the historian, and it is therefore found that the common names applied to a stringed instrument with a finger-board, kissar, cittern, zither, kitra, kithara, geytarah, guitar, point to the common origin.

There is no question but that the guitar was introduced into Europe after the Crusades. The name, purely Eastern, has been adopted with only a variation in spelling as European use demands. The modern Egyptians call it "gytarah barbaryeh," the guitar of the Berbers, the people who are the direct descendants of the ancient race of the country; and as names and words in the East vary in the course of ages less than those in the West, it is likely that the word is of high antiquity.

When Hans Christian Andersen, one of whose dearest hopes in going to Sweden had been to meet Fredrika Bremer, was presented to her on the deck of a steamer, she had never heard of him, and was quite stiff. He produced one of his books, however, as she left him; and after an hour or so she hurried back. "I know you *now*," said she; and thus began a lifelong friendship.

RELIGIOUS MATTERS.

It is stated that, since disestablishment, the Irish Church has raised $20,000,000 for the cause of religion and charity. Nearly $1,500,000 per annum has been secured for the stipends of the clergy. Upward of 1,200 incumbents receive an average of $1,050, and 211 receive an average of $600 per annum.

The Sixth Triennial Conference of the German Baptists of America was held recently at St. Louis. Delegates were present from 14 States and from Ontario. Prof. H. M. Schaffer was elected Moderator. Considerable attention was given to educational and publishing interests, and a new hymn-book was ordered.

In the discussion recently in the Glasgow Presbytery of the Kirk of the volume of "Scotch Sermons," Dr. Norman Macleod ascribed the origin of the agitation against the sermons to a member of the Free Church, and asserted that more than one distinguished writer in the volume was in total ignorance of the other sermons with which theirs were to be combined.

The commotion in the Church of Scotland growing out of the publication of the volume of "Scotch Sermons," is increasing rather than subsiding. The Glasgow Presbytery has ordered a committee of inquiry in regard to two sermons regarded as heretical contributed by one of its members, and more recently strong objections was made to Dr. Story, of Roseneath, becoming Moderator of the Synod of Glasgow and Ayr, because he was one of the contributors to "Scotch Sermons."

Recently the Duchess of Edinburgh, accompanied by two ladies and a gentleman, visited Canterbury Cathedral. The verger who conducted the Duchess and party over the building had not the remotest idea who he was guiding until after they had gone the round. Indeed, the Duchess and her suite were asked to withdraw from the north aisle on the plea that no one was allowed to remain in that part during divine service, a request which was immediately complied with.

In his charge recently the Archbishop of Armagh said, concerning the Disestablished Church, that, during the last 10 years, nearly one-half the clergy who occupied benefices at the time of disestablishment had disappeared from among them—some retiring from age and infirmity, some removing to other dioceses, and others having gone to England. Of course, those who went away had carried their commutation capital with them. Owing to these causes, it would become necessary to fall back upon the practice of former times, and place more than one parish under the care of one minister. The candidates now presenting themselves for ordination were generally below the required standard of education. Even the qualification of a collegiate degree had sometimes to be dispensed with. There was such a dead level of uniformity in the value of their benefices that there was little prospect of promotion, and nothing to attract the rising talent of the country.

Carolina's Sweet Sixteen.

A curious petition was that addressed in 1733 to the governor of South Carolina by sixteen maidens of Charleston. It ran thus: "The humble petition of all the maids whose names are underwritten. Whereas, we, the humble petitioners, are at present in a very melancholy disposition of mind, considering how all the bachelors are blindly captivated by widows, and our own youthful charms thereby neglected; in consequence of this, our request is that your excellency will, for the future, order that no widows presume to marry any young man till the maids are provided for; or else to pay each of them a fine for satisfaction for invading our liberties, and likewise a fine to be levied on all such bachelors as shall be married to widows. The great disadvantage it is to us maids is that the widows, by their forward carriage, do snap up the young men, and have the vanity to think their merit beyond ours, which is a great imposition on us, who ought to have the preference. This is humbly recommended to your excellency's consideration, and hope you will permit no further insults. And we poor maids, in duty bound, will ever pray." The forlorn sixteen would have approved the edict of the Portuguese king, which forbade widows more than fifty years old from remarrying, on the ground that experience taught that widows of that age commonly wedded young men of no property, who dissipated the fortunes such marriages brought them, to the prejudice of children and other relatives.

French Orders.

The badges of the inferior orders of the Legion of Honor have been pretty eagerly sought for by foreigners, even by Englishmen. It is related of an English merchant who had rendered some service to Napoleon III. that he was invited by that prince to spend a few days at Fontainbleau. When the merchant took his leave, the Emperor asked him whether he could be of service to him in any way. "May it please your Majesty," stammered the guest, "I should like—the Legion of Honor." Repressing the national habit of shrugging his shoulders—ever so slightly—Cæsar replied that he should be most happy to give him the cross. "I fancied," he added, "that your government did not allow you to wear foreign decorations. However, if you can make it right with the English administration, you are heartily welcome. Meanwhile you must permit me to give you a cross of the Legion worn by my uncle the King of Westphalia." So saying, the Emperor went to a drawer, and took out a diamond that had once glittered on the marshal's uniform of Jerome. It was handsomely done: grave as were his faults, Napoleon III. always showed himself a gentleman.

The Legion of Honor has this agreeable peculiarity, that it is accompanied by pensions—in the case of military knights. A plain chevalier receives 250 francs a year, a Grand Cross 5000. The chancellorship of the order is a very snug berth indeed. Besides a fine income, the Chancellor has handsome apartments rent free and "perquisites." Of course the post is generally bestowed on an old soldier; though on the restoration of the Bourbons in 1814 it was given to an eminent clergyman whom it had been found difficult to put in any other place. The porter of the palace caused some amusement by addressing the abbe, on his official entry, in the set phrase which he had used toward successive captains of great fame: "You have only to command, marshal; it will be my business to obey."

There is one other French order of importance: the military medal. It is of gold, encircled in silver, and suspended by a short ribbon of green and yellow. Coveted almost as much as the Victoria Cross, its numbers have been extended so as to include civilians, the proportion being one of the latter to every two soldiers or sailors. When Bazaine had been for some time a Marshal of France and Grand Cross of the Legion of Honor, he received the military medal—a graceful compliment, which was meant to indicate that the cup of his honors was full, and that there was nothing left for his imperial master but to give him the remainder of the lesser decorations.

Fixing Her Hair.

When a girl concludes to put up her hair and make herself look sweet, the best policy is to let her have her own way. She can't be drawn away from her mirror by any of the ordinary things of this life. A fire will sometimes do it, but it has been shown that even a fire may fail to excite some girls. The other night a New York lodging-house took fire, and at a most uncomfortable hour, when most girls probably have their back hair down. One of the young ladies heard that the place was burning down, but she didn't feel like making her appearance before the crowd that had gathered in the street looking like a perfect fright. She shut the door leading into the hall to keep out the flames and went to her mirror to fix her hair. Anybody who has waited for a girl to fix her hair knows that it takes time and a great deal of it. This girl wasn't any quicker than the average, and she was very particular about having her hair done up exactly as it should be. The fire had cut off her chances of escape by the stairs, and her lover, after appealing to her for some time, finally lost his patience and got away without her. A fireman got up to the room on a ladder and she made him sit on the edge of the window and wait until she had arranged her hairpins and ribbons for a right sort of public appearance, then she threw herself into his arms—it was so romantic—and slid down the ladder with him, looking just sweet. The whole thing was a tremendous success, but when the careful young girl was safely landed on the pavement she found that she had forgotten her stockings.

The *Osservatore Romano* tells its readers that, notwithstanding the terrible trials under which the Irish are now suffering, the faithful of Cashel, mindful of the needs of the Holy See, have contributed a sum of money equivalent to 60,000 francs for their Archbishop's present to the Pope.

INTERESTING ITEMS.

Belgium had no gold coin until 1847.

A gentleman writes to the London *Standard* that cats can be trained to retrieve game as well as dogs do. When he takes his gun in his hand his three cats are in ecstasies in anticipation of sport.

Prof. Levi. in lecturing at King's College, London, on the value of a good harvest to trade and manufactures, said that every day of sunshine during forty or fifty days after July 15, St. Swithin's day, was worth about $5,000,000 to the country.

An insane woman at Cleveland laid a little boy down with his head between two stones, and placed a heavy timber across his neck in such a way that he was held fast without being choked. She left him to die, and he had almost done so when discovered.

A soap-eating match was a diversion at Springfield, Ohio. The quickest devourer of a bar of yellow soap got a prize of $5. The winner performed the feat in less than an hour, but was much longer in the hands of the physician, because the lye poisoned him.

That gigantic floating palace, the Livadia, made, in passing from Cork to Gibralter, upward of seventeen miles an hour, while there was a total absence of any disagreeable motion, her "pitch" being but one degree. This may lead to a great change in ship building.

The subcutaneous injection of sulphuric ether, in three-drop doses, at intervals of 12 hours, is recommended by Dr. Comegys for the successful treatment of sciatica; and he also thinks that the substitution of ether for ergotine in dealing with tic-doloreux would give good results.

Ozark furnishes another tough Arkansas story—that White Oak Mountain is flinging out stones of all sizes up to two pounds in weight, which fall like hail into the fields and disperse the inhabitants. Were the stones hot, or were smoke and flames seen, a volcano might be surmised; but the affair is spoken of like one of simple stone throwing.

Few persons outside of England, where coursing is one of the national sports, have any idea of the value of greyhounds. At a recent sale ten dogs brought 711 guineas, the highest being sold for 400 guineas and the lowest 10 guineas. This is not in excess of former sales, Bedlamite and Peasant Boy, two well-known hounds, each having brought 500 guineas, and for master McGrath, probably the most famous dog ever bred in England, his owner, Lord Lurgan, was offered the sum of £4,000.

Ships that will not sink are to be desired in these times, and an Englishman named Lamb thinks he has one in a steel steam launch, which has seven flat air-tight cylinders on each side. There are some minor novelties in construction, but there seems to be no difference in essential principles between Mr. Lamb's and the ordinary compartment system. This latter might do better were it rigidly kept free, in practice, from improper use in the stowing of cargo and surplus material.

The bridegroom of a Waukegan wedding was a Baptist and the Bride a Methodist. They had agreed that, immediately after the ceremony, they would decide by chance which should embrace the other's religion. The officiating clergyman declined to toss up a cent, partly because he would not countenance such a proceeding, and partly because, being a Methodist, he might be accused of fraud if the bride won. The bride herself finally threw the coin, and lost. When she went to join the Baptists, however, they rejected her because she did not believe in close communion. That displeased the husband, and he went over with her to the Methodists.

The other day an Englishman went over to Ireland to see a friend of his, who is an Irish landlord. He said that he should like to meet one of the most ardent opponents of landlords, and his friend referred him to the village blacksmith, who, he said, was a good enough fellow, but who, he believed, contemplated shooting him shortly. To the forge he betook himself, and the blacksmith explained the wrongs of Ireland. "Are we not," he said, "suffering from absentees taking from Ireland all the money that we earn, and do you suppose that we mean to continue to pay this tribute to the Saxon?" "But," replied the Englshman, "here there are many resident landlords." "You are mistaken," answered the blacksmith. "I know the country, and I tell you that it is full of absentees."

Monstrous Hides.

HOW THE SKINS OF THE RHINOCEROS AND BOA-CONSTRICTOR ARE UTILIZED.

The hides of the bull, bear, cow, calf, sheep, goat, kid, and even the alligator, for years past, have been sold in the leather markets, and are considered the most desirable for the manufacture of boots, shoes, saddlery, harness and other articles for the general use and wear of both men and beast. But the ingenuity of this latter day American seems to have no limit. Forests and jungles of the sunny Eastern hemisphere have been penetrated in order to satisfy the wants of fashion and of trade. The hides of the ponderous, clumsy and ugly rhinoceros and the treacherous, venomous boa-constrictor are now being turned into profitable account by manufacturers.

The hide of the rhinoceros, being of the heaviest and thickest description, would appear to many to be more serviceable for the manufacture of saddlery and harness, but this is not the case. Manufacturers and dealers in these articles have discovered this most endurable leather to be of little use in their trade, because, owing to its solidity and thickness, a needle of any power or sharpness can hardly be made to penetrate it. Some two months ago a manufacturing firm tested the durability and usefulness of rhinoceros hide in the manufacture of a carriage spring. It was patented, but rhinoceros leather was in too great demand to satisfy the supply of these springs, and only by slow work could orders be furnished; then the result of this innovation developed itself, and the hide of the mighty beast, it was discovered, could not withstand as much of wear and tear as the delicate kid, if made in the same thickness and applied to the same uses.

The skin was tanned and imported here by foreign concerns, and when placed on sale, brought very high prices. Its general utility was not known to a very great extent until lately. At present the hide of the rhinoceros is chiefly adapted to the manufacture of jewellers' buffing wheels, which are required in making a polish on gold jewellery, like that brought out in burnishing brass. In Germany and England there are about a dozen tanneries where the skin of the rhinoceros is prepared for the market.

The skins are sent to the tanneries direct from Africa, in some cases by regular hunting expedition parties. It requires from two to three years' time to prepare the hides of these huge monsters for the leather market. When the time and cost required are taken into consideration, the cost of rhinoceros leather after importation is considerable.

From one whole rhinoceros skin it is estimated that at least 250 pounds can be easily secured for utilization from the tannery, and when assorted will, when sold, bring from $300 to $400. Although it takes nearly three years to prepare one of these hides for the market, at least 100 could be run through the process at the same time.

The skins of the boa-constrictors are supplied through the European market, but are directly brought from the deep forests of both Asia and Africa. The serpents are trapped and secured by the slaves of Oriental, Turkish and Egyptian tradespeople, who have long been supplying the demands of snake charmer, showmen and stylish dames and damsels of foreign countries. The snakes are often worn around the necks and arms of these people while alive. They are made harmless by the skill of the necromaneer or serpent-doctor, who is honoured for his wonderful powers in successfully tearing out the fangs and drawing the deadly poison from these serpents.

Ladies, waist belts and chatelaines are worn made of the serpents' skins upon the streets daily. Such appliances create curiosity wherever seen, looking so wild and barbarous in their design as to cause doubt as to their genuineness. They bring good prices. Card, cigarette and cigar cases and portemonnaies are made to order from the same material, as well as small satchels and shopping bags. In securing these king serpents of the forest and jungle, the greatest of dangers are encountered.

The manner of preparing the skins for the tannery is of a delicate nature. After the serpent has been put to death by a means that will preserve the skin from any injury, the body is passed over to a taxidermist, who strips the hide as he would the skin from an eel. The tanner doctors the frail hide so that it becomes perfectly pliable, and retains all its natural appearance and colour as in life. Boa-constrictors, though a very ferocious and dangerous species of serpent, are also of a very costly order to obtain. In this country they have heretofore been considered only in the light of an attractive feature among many curiosities attached to a circus, side show, or private or public museum.

GENERAL.

A MAN committed suicide at Columbia, Ky., by tying a handkerchief around his neck and tightening it with a cane.

THE New-Zealanders are destroying their forests in a manner so reckless that there is a fear not only of a scarcity of timber, but that the climate will soon be changed for the worse.

SOME one has said, what thousands have observed, there is nothing that keeps longer than a middling fortune, and nothing melts away sooner than a great one. Poverty treads upon the heels of great and unexpected riches.

Two Texas desperadoes agreed to fight with knives in a closed room at Fort Worth. They put up their watches as forfeit, and, as both had shown reckless daring in former affrays, it was believed they fully intended a deadly duel. They were prevented by arrest.

A MECHANIC at Beaufort, S. C., intent upon suicide by drowning, but desirous that his body should be recovered, fastened lead to his head and life preservers to his feet before leaping into the water. So he was quickly drowned, while his legs floated.

THE recent earthquake at Lisbon, Portugal, seems to have caused little damage; but it recalls the disastrous one of 1765, by which that city and about 60,000 people were destroyed. Severe shocks have also been experienced lately in other Spanish towns and in sections of France.

So the Prince of Wales is 39 years of age. He may be as much again before the Queen takes it into her head either to die or to resign. Really this longevity trick leaves a young fellow no show whatever, He is used up and gouty before he has the slightest opportunity of showing what he can do. Well, well. There is no help for it but patience. All things come to him who can wait.

RECENTLY Prof. Huxley said that ninety-nine men out of every hundred became simply obstructed after sixty years old, and were not flexible enough to yield to the advance of new ideas. The world, he thought, would be benefitted by any man who had taken part in science being strangled after sixty. This may be meant for Brother Ruskin, who lately wrote to Glasgow students that he loathed liberalism.

JUSTICE SMITH said, on opening his court at Connorsville, Tenn.: "Well Henry Smith is arraigned for assaulting his father." The magistrate had on the previous day knocked his father down with a club, and it was himself that he was now arraigning. He continued: "The evidence is conclusive, and I'm not sure but I ought to send myself to jail for ten days. But, as this is my first offence, and I certainly had a good deal of provocation, I will simply impose a fine of ten dollars."

THE *Londonderry Sentinel* says: "At all events, so far as Ulster is concerned, she will not shirk her duty; and it will be well for our rulers to remember, ere too late, that if they leave the loyal and well-disposed people of Ireland much longer to the mercy of demagogues and assassins, and the present reign of terror is allowed to continue, the men of the north may again be compelled to seek stronger remedies for the protection of their lives, property, and liberties." The rebellion of 1798 began among the Presbyterians of Ulster, a circumstance of which few are aware.

THAT the hardest steel is not the most durable for railroads appears from an examination of the wear of some of the steel rails on the Great Northern line, England. Seven of the rails, which lay side by side on this road, were taken up and tested, and it was found in one instance, that a hard rail had been worn away one-sixteenth of an inch by traffic amounting to 5,251,000 tons, while soft rails for the same amount of wear had withstood 8,402,000 tons for the hard rail and 31,061,000 tons for the soft rail, the wear being the same—one-sixteenth of an inch. Analysis showed this last rail to consist of 99,475 per cent of iron, and minute quantities of carbon, phosphorus, silicon, manganese, sulphur, and copper.

A Rebel Telegrapher.

EXPERIENCE RELATED BY EX-GOV. BULLOCK OF GEORGIA.

Many times, and in various ways through life, my practical experience as a telegrapher has been of valuable service to me. It is, perhaps, not entirely forgotten that, a few years ago, there was a "misunderstanding" among the politicians, and that ultimately the able-bodied men on either side made a good deal of noise about it. Well, I was on the south side of that noise, and, being patriotic but not belligerent, I gave my uniform to a chap who thought he had an enemy, and devoted my energies to finding some to serve the confederacy efficiently that did not at the same time involve the risk of a stray bullet depriving the government of my usefulness. There was quite a number of other patriots in the express company's management who harmonized in my idea; and, as a natural consequence, we were soon impressed with the great necessity that existed for the express company to build and operate telegraph wires over routes not covered by existing lines. Several of us were also stockholders in the American Telegraph company, and when the noise hitherto spoken of interfered with "sound reading" between Washington and Richmond, we felt it to be our duty to take charge of the lines this side, and we became the "Southern Telegraph company." You will see that, with all this array of usefulness, it would, indeed, be an unwise and thoughtless, not to say hard-hearted, conscript officer who would believe it his duty to send us to the front as musket bearers! If he could see, as many of them did, the tireless industry with which express men devoted themselves to the study of dots and dashes—beating a tattoo for freedom on office desks, car safes, eating-house-tables, in fact anywhere that would echo the evidence that they were telegraphers and entitled to exemption—the certificate of "detail on telegraph duty" would be sure to come.

To pass the inspection of the conscript officers it was necessary for the traveler to have "duty orders," "furlough," "exemption papers," or a black skin; you can therefore imagine the satisfaction a patriot would feel when he exhibited his detail as a telegraph operator and knew that he was more likely to serve his country to the end of the war than the poor fellow with but one arm or one leg, traveling home on furlough.

Many of the inconveniences of the early telegraph days were repeated here during the war. Insulators were made of clay with a glazing. For wire we depended on the uncertainties of blockade-running and the Morris wire-mill, at Richmond, which turned out only short lengths, and few of those. Old magnets were rewound and old instruments rebuilt. Nitric acid was hardly obtainable, and substitutes hard to be discovered and used; but the wires were kept working and new lines were rebuilt.

When Gen. Sherman started on his excursion from Atlanta to Richmond, via Savannah, active industries on that route were inaugurated for telegraphers as well as fighters. The coast lines were generally abandoned, and nearly all the business was transmitted over the express wires.

On the morning of the evacuation of Columbia, I left our office and affairs there in charge of Mr. Soule, our telegraph operator, and that night I, being at Gen. Beauregard's headquarters, held telegraphic communications with Soule, he being in Columbia and within Gen. Sherman's command. This, I presume, was the only peaceful communication ever held by telegraph between the contending parties during the war, and might, perhaps, have been less peaceful for Soule and myself if it had been known to either commander.

Probably the most useful service ever rendered by our telegraph was in transmitting information of the surrender, and orders from Gen. Sherman, at Raleigh, to Gen. Wilson, at Macon, to cease operations, thereby saving Macon, Augusta, and other places from hostile occupation. The express wires through the interior part of the country were the only ones in operation at that time.

IN boring for water in the Wimmera district, Victoria, recently, a tree was passed through for 6 feet at a depth of 250 feet, and the cup brought up several fruit-stones similar to the nuts of plums; some were smashed, but the kernels were recognizable. It seemed evident that there was a grove of trees there.

MONEY is being so freely contributed for the purpose of clothing and civilizing benighted Africans that it is becoming profitable to go to Africa and be a heathen.

SCIENTIFIC GOSSIP.

PROF. TASMANIA attributes the immediate cause of death by hanging to the closing of the respiratory organs.

THOSE who will smoke cigars would do well to use a mouthpiece of some kind or other. It has been ascertained that some of the ways in which cigars are made are apt to cause sore mouth of a dangerous and persistent kind by transmitting the poison which is said to be so prevalent in China as to be the bane of that country.

THE lighting of the reading-room of the British Museum by the Siemens electric lamp has been resumed for the winter. The apparatus of the lamps are now fitted above the arcs; brown japanned reflectors send the light to the floor, and topaz-colored glass screens are placed beneath the arc to intercept the blue rays which interfere with the purity of the light.

THE electric lamp can prove quite as fatal as the kerosene lamp, each in its own way, of course, if people do not take care. Recently one of the men on board the Czar's new yacht, the Livadia, was asked to support an electric lamp for a short time before it was hoisted into position. In some way or other he managed to divert the current from the candle and sent it through his body, and he died instantly.

EXCELLENT work will no doubt be done in the near future at the Warner Astronomical Observatory at Rochester. The telescope—the third largest in the United States—will be 23 feet long, and will have a lens 16 inches in diameter. Prof. Swift will have, with this telescope, a wider field for his powers of observation that have proved to be so fertile under less advantageous circumstances.

As a simple lecture-room experiment illustrating the appearance of ozone when liquids are evaporated, Dr. R. Boetiger recommends the following: A piece of paper is evenly moistened with starch containing iodide of cadmium. A few drops of alcohol or ether is ignited. When the flame is extinguished the paper will be of a decidedly blue color, from the action of the ozone formed during the evaporation.

A COMMISSION of 27 members will carry out the revision of the German "Pharmacopœia" at Berlin. Sixteen professors from various universities, five apothecaries, and six physicians and surgeons of high standing in their vocations, make up the commission. Besides these, the forthcoming work will have the benefit of the experience of two military physicians and a military surgeon, who have been specially selected by the Prussian War Office. The labors of these men were commenced fully a fortnight ago, and the result is expected to be of a very high quality.

IN a recently published paper by Mr. W. O. Crosby and Mr. G. H. Barton on the "Extension of the Carboniferous Formation in Massachusetts," the authors infer that although the Norfolk County basin contains only beds of the carboniferous age, yet it is improbable that coal will ever be discovered in its limits, this narrow trough having become filled with sediments, and converted into dry land before the deposition of the true coal measures began, and this later formed series having been always apparently restricted to a comparatively small part of the main or Narragansett basin.

THE people of Sheffield, Engiand, have the privilegs of using an equatorially mounted telescope in the Public Museum under the direction of the curator. Many an ambitious student in this City would be most thankful to the man who would provide a like aid here for the verification of known and the discovery of new facts. Our intelligent citizens also would find in it a means of elevating and stimulating mental pleasure. We should not long be without even a better instrument if some of our rich and thoughtful men would give the matter their attention.

A PAPER by M. Poirot was read before the French Academy of Sciences, recently, in which he alleged that he had never seen flies, ants, worms, or even scorpions, tarantulas, or rattlesnakes in those places in North America where absinthe plants prevail. He urges the cultivation of the plant as an insecticide, and especially as a preventative against the ravages of the phylloxera. There might probably be safety to the vines, he thinks, if the land were manured with absinthe, as such a course would tend to interrupt, or prove absolutely fatal to, the metamorphoses of the phylloxera.

THE CANADA LUMBERMAN

AND MILLERS', MANUFACTURERS', AND MINERS' GAZETTE.

ISSUED SEMI-MONTHLY AT TORONTO, ONT.

A. BEGG, - Proprietor and Editor.

TERMS IN ADVANCE (Post-paid):

One Copy one year..... $2 00
One Copy six months..... 1 00

ADVERTISING RATES

$1 50 per line per year; 85 cts. per line for six months; 50 cts. per line for three months.

Small Advertisements 10 cts per line first insertion 5 cts. per line each subsequent insertion.

Business Cards, Forms of Agreement, Bill Heads, &c,. promptly supplied to order, at the LUMBERMAN Office.

Communications, orders and remittances should be addressed to A. BEGG, LUMBERMAN Office, 33 Adelaide Street West, Toronto.

TORONTO, ONT., NOVEMBER 30, 1880.

Special Notice.

Parties receiving this number of the LUMBERMAN, who have not yet sent in their subscriptions, will please do so by return mail. Our terms are *cash in advance*, and the LUMBERMAN can only be sent to *paying* subscribers.

PROSPECTUS.

The CANADA LUMBERMAN is now introduced to its patrons, and so far has met with a favourable reception.

Before its publication a large number of lumber and timber merchants and mill owners in the Provinces of Ontario, Quebec New Brunswick, and Nova Scotia, and manufacturers whose line is to supply machinery for mills, saws, axes. files, oil, belting, sleighs, &c., were consulted in reference to the advisability of publishing such a journal.

Their opinion was that such a publication could be made highly useful to parties engaged in the various branches of trade above alluded to, as well as to those more directly interested in the mines and minerals of Canada.

Acting on their suggestions, THE CANADA LUMBERMAN has entered on this extensive and important field, with an adequate sense of the responsibility of the undertaking; and whilst craving leniency until fairly under way, we may repeat a portion of our introductory, viz: nothing shall be wanting on our part to make this journal a full and complete record of the lumber business, and all that relates to the trade in Canada. To this end the latest market reports, the contributions of trustworthy correspondents, trade circulars, etc., will be freely used, to give our readers the best, the earliest, and most reliable information that can be ascertained, concerning the important branch of business to which the journal will be especially devoted; while the mining, the milling, and the manufacturing interests will receive attention proportionate to their great claims on the public.

In short, it will be our endeavor to make THE LUMBERMAN worthy of its title in every respect; and, while giving special attention to the great staple industry to which it is devoted, it will also furnish a carefully selected amount of general reading that will make it a welcome visitor in every family.

Advertisers, especially those dealing in mill, mining, and lumbering supplies and machinery, will find THE LUMBERMAN a very favourable medium of reaching their customers, as it will circulate among these classes, and receive more attention from them than they have the time or inclination to bestow on a general newspaper.

The success of the LUMBERMAN must depend on the support it will receive from the classes above referred to; we trust, therefore, that they will overlook shortcomings at the commencement, and accord to the enterprise their generous and hearty support.

SAD MINING DISASTER IN NOVA SCOTIA.

On the 12th of the present month, one of those terrible disasters, incident to coal mining operations, took place at Stellarton, near New Glasgow, Nova Scotia, by the explosion of the Foord mine, resulting in the death of some fifty workmen, and widespread misery among the survivors. One hundred and ten children have been made fatherless by the sad catastrophe, and thirty-eight widows are left to mourn the loss of their husbands. Never before has such a calamity befallen the mining industry of our sister Province, and it is earnestly to be hoped that the searching investigation now being held, will result in the discovery of precautionary measures that will render like calamities impossible in the future. It is hard, however, to guard against the carelessness of individuals. Men become foolhardy by familiarity with danger, and the rules that are devised for their own personal safety are sometimes disregarded as if they were tyrannical exactions that ought not to be borne. For this deplorable state of feeling there is no cure, unless workmen can be persuaded that their own personal interest is involved in the due observance of every rule laid down for the safe working of the mine, and, perhaps, it would not be mistaked policy on the part of mine owners, to give their workmen some share in the profits of the business. In too many instances, the workman has no interest beyond that of putting in his day's labour, and drawing his weekly pay. That he should, under such circumstances, be a careless worker, goes beyond saying—Why should *he* care? He goes down the shaft in the morning; he comes again at night, and except for those who are waiting for him at home, he has no thought beyond getting through his allotted drudgery.

Judging from the names recorded in the sad list of the dead, the workmen at the Stellarton mine were largely recruited from the descendants of the brave sons of Old Scotia, who settled in such numbers in our sister Province by the sea. And they perished with no less heroic bravery than did many of their ancestors on the gory battle field. But the touch of glory in this case was wanting. The stern struggle with the outraged forces of nature did, indeed, give every opportunity for the display of heroism. But no eye was there to witness it; no pen to embalm it in imperishable language. Nevertheless, incidents are recorded of a deeply touching character. One man went down and stumbled upon two bodies—that of a man and a boy. Bravely he shouldered them—the man first and the boy afterwards—and brought them to the top. What was his unspeakable joy when he found that he had rescued his own father and his own son?—for they were both alive! But suddenly his joy burst into grief as he bethought him, and cried out in anguish, "my brother Robert is still below, and my poor mother will break her heart!" Is it asking too much, that men engaged in such hazardous enterprises should be made partakers, to a moderate extent, in the profits of their labour, as distinct from their pittance of weekly wages? We are sure that the introduction of such a system would vastly improve the moral tone of the working miners, and in the end add to the profits of the mine owners. Sympathy has been awakened throughout the Dominion and in the neighbouring republic for the bereaved families, and contributions are liberally pouring in.

The Foord mine took fire after the explosion and had to be flooded. The water was admitted at a rate, per day, which will take months to pump out; so that much time and loss of capital will be involved before getting the mine into working order. It has been ascertained that there are twenty-five widows, nine old persons, and ninety-six children, below the age of thirteen, making in all one hundred and thirty people thrown upon the charity of the world by this terrible catastrophe. The rest of the bereaved have means to support themselves, but for those who are in want, it is to be hoped that a generous public will make no niggard provision.

THE CALEDON STONE QUARRIES.

Our attention was incidentally called to what has long been felt to be a want in the city of Toronto, viz: a supply of good building stone; that is, stone of good quality, handsome in appearance, not too hard to work, and moderate in price. The opening of the Credit Valley Railway has made accessible the excellent freestone quarries of Caledon, at a comparatively short distance from Toronto, and capable of supplying any quantity of either red or white stone, at about one half the price of Ohio stone. The quarries are owned—one by K. Chisholm, Esq., local member for the county, and the other by Mr. Joseph Pattullo, of Orangeville, and Dr. Pattullo and Judge Scott of Brampton. Those three latter named enterprising gentlemen have formed themselves into a company, called the Credit Forks Stone Co., with Mr. J. A. McIntosh, as manager, for the purpose of developing their quarry. Several orders are now being filled, and it is expected that a large trade will be carried on by the Stone Company and by Mr. Chisholm, in this superior building material. It would be a great convenience were a depot established near the City of Toronto, where supplies could be obtained as required, by builders. So far, sales have been made at the quarries, f. o. b. the price ranging from $6 to $54, per car load—two cords of 128 feet of rubble, or 160 cubic feet of dimension stone making a car load. Those quarries will prove a source of great revenue to the Credit Valley Railroad as the trade increases, as it undoubtedly will, when the superior quality of the stone becomes better known. Shipments have already been made to London, Woodstock, Fergus, Orangeville, and Hamilton; and in Toronto the new Baptist College, on Bloor street, is to be built of the Caledon stone. In Brampton, the Presbyterian Church just finished, is built of this stone, and the blending of the red and white layers gives the stately edifice a lively and handsome appearance. Blocks varying from three feet thick, by six feet square, have been taken out for engine beds, and larger blocks might be got if required.

The locality is well supplied with water power. Mr. Chisholm, who owns several hundred acres in that section, has erected a woollen factory and a saw mill near the "Credit Forks," and it is said that this is one of the few points where a paper manufactory could be profitably established, as any quantity of wood suitable for making paper, could be obtained in the vicinity, within easy transit by rail of any part of the Dominion. This is one of the most healthy sections in Ontario, being the highest point of land in the Province, between Lakes Huron and Ontario. The River is well supplied with speckled trout, and we understand it is contemplated by the enterprising and indefatigable manager of the Credit Valley Railway, to make this romantic neighbourhood one of the most attractive places of summer resort for tourists and pleasure and health seekers to be found in the Dominion.

Mr. Church, of Cataract, is the owner of a tract of land not far from the quarries above referred to, but we have not learned the particulars as yet respecting those quarries on his land.

OUR QUEBEC LETTER.

NAVIGATION CLOSED—TIMBER IN THE COVES—A LULL IN THE TRADE—NO CHANGE IN PRICES—MILLING NOTES—MINING INTELLIGENCE—NEWS FROM THE GOLD MINES OF BEAUCE.

QUEBEC, Nov. 22.—The season of navigation may now be said to be closed, and the Allan Mail Steamship which sails from this port on Saturday next, will leave behind it a deserted harbour. But one solitary timber vessel now remains, and with her it is not a matter of choice to be still here, but of necessity. The "Bridgewater," with a cargo of lumber on board, has been detained by a number of suits in the Vice-Admiralty Court, arising from quarrels between the captain, the owner and the crew. To add to the troubles of the owner, the captain and crew have left his service at the last moment, and in the westerly gale of yesterday morning, the vessel went ashore at Burstall's Booms. If the "Bridgewater" gets to sea at all this Fall, her owner may consider himself a lucky man.

TIMBER IN THE COVES.

After all that has been said and anticipated about the small stocks that would winter at this port, it appears that the amount in the Coves is considerably more than had been calculated. This is to be accounted for mainly by the fact that the Fall fleet was much smaller than was expected. The principal portion of the stocks now wintering here, would have been shipped ere this, had vessels offered. Three rafts of square white pine are all that are held in the Quebec Coves in first hands this winter.

A LULL.

There is necessarily just now quite a lul in the timber trade. Nothing is offering, and there is no demand in the local market. Merchants are closing their accounts for the season, and taking stock in their Coves. It is impossible, at present writing, to form any calculation of the stocks wintering in the various Coves. Estimates will shortly be made however, and the readers of the "LUMBERMAN" will be kept posted. As there are no transactions, there are in consequence no changes to report in the prices. These may be set down as similar to those reported in my last letter.

OPERATIONS IN THE WOODS.

It is impossible just now to form an accurate idea of operations in the woods. By about Christmas, however, merchants, brokers and cullers will have some estimate of the probable make of the season. Our merchants at home, or the correspondents of such as remain on this side, will also by that time be in a position to judge of next year's prospects, and we may expect to hear of further large sales for future delivery.

MILLING NOTES.

The Montmorenci and other mills in this district, have as much as they can possibly do, and will work full time all winter. It is said of the Montmorenci mills in particular that their entire winter's cut has been already sold.

Quite a local demand for lumber has arisen in the old mining district of Beauce. In order to supply the requirements of this part of the country, Mr. Louis Gendreau, who is himself largely interested in mining lands, is erecting at Jersey Point, St. George, on the Chaudiere river, a very extensive steam saw mill, the necessary machinery for which has been recently purchased in Montreal. The mill will be in working order before the winter is over, and Mr. Gendreau is now getting out 25,000 to 30,000 pine and spruce logs for next summer's cutting.

MINING INTELLIGENCE.

The Mr. Gendreau above alluded to has just concluded the sale to a New York capitalist for $6,000, of some 51 acres of gold lands forming the principal part of Lot No. 15 of the De Lery Concession on the Gilbert river, Beauce.

The Beauce Gold Mining and Milling Co. is working the adjoining Lot, No. 14, De

Lery Range, on a large scale, the Superintendent being Mr. Walter J. Smart. The differences which have existed for some time past between this company and Mr. Lyonais, who sold them the rights upon which they are now working, have been amicabiy arranged.

Lot No. 13 De Lery Concession is worked by Mr. J. Ainsworth. The last few washings on the works of this property are said to have shown an average yield of $200 a day,—being the produce of the work of 35 men. One of the men found a nugget a few days ago, weighing four ounces, and worth somewhere about $80.

The preparations in that part of the county give promise of very large operations for next year. It is believed that in the spring, over 1,000 miners will find employment in Beauce. A few days ago, information was received here that a new company, to be called the Boston & Chaudiere Mining Co., had been established in Boston, with a capital of half a million dollars, the whole of which was subscribed in the space of a few hours. Some of the English companies operating in the diggings profess to suffer in their work from the severity of the restrictions imposed by the recent Provincial Act relating to mines, and one of their representatives is actually at Ottawa, for the purpose of inducing the Federal Government, if possible, to declare the whole of the legislation in question, *ultra vires*.

Great inconvenience is also experienced in the lack of telegraphic communication between St. Joseph and Jersey Point. The enterprise necessary to construct this short line would be richly rewarded. The principal miners of the district have even offered to supply the necessary poles. Which of the Canadian telegraph companies will take the matter in hand?

STADACONA.

New Brunswick.

Canada is so extensive that the inhabitants of one portion of it may not have much acquaintance with other portions. The following extracts from a pamphlet recently published by the Hon. Mr. Adams, Surveyor-General of New Brunswick, will convey much information respecting that Province. Mr. Adams says :—

The Province of New Brunswick, one of the eight Provinces of the Dominion of Canada, is bounded on the North by the Province of Quebec, the Restigouche River and Baie des Chaleurs; on the East by the Gulf of St. Lawrence and Northumberland Strait, which divides it from Prince Edward Island; on the South by a small portion of the Province of Nova Scotia, Chignecto Bay and the Bay of Fundy; on the West by the River St. Croix and the State of Maine in the United States of America.

The area of New Brunswick as given by the Census of 1870-1 is 17,393,410 acres, or about 27,177 square miles. The greatest length of New Brunswick is from North to South, a distance of about 230 miles, and the greatest width is about 190 miles, with a sea-board of some 545 miles.

The population in 1861 was 252,047, and in 1871 it reached 285,777, showing an increase in ten years of 33,730. At the present time (1879) it would probably reach something over 310,000.

The quantity of land already granted or located by the Crown is given at 9,753,804 acres, and vacant lands at 7,639,606, up to 31st Oct., 1878.

PRINCIPAL TOWNS.

Saint John, situated on the mouth of the River Saint John. It is the Commercial Capital of New Brunswick, and has a population of about 45,000, including the town of Portland. It does an immense shipping business with foreign and local markets, and is largely engaged in manufactures of many kinds. Its harbour may be reckoned among the finest on the Continent, and is open during all seasons of the year. As a shipping port Saint John ranks fourth in the British Empire.

Fredericton, the Capital of New Brunswick is situated on the south-west bank of the River Saint John, about ninety miles above the City of Saint John. Its streets run at right angles, and are adorned with trees, which add greatly to its appearance during the summer and autumn months. The House of Assembly, Government House, and the different Departmental offices, the University of New Brunswick (formerly King's College), and the Provincial Normal School are located here. Considerable trade in lumber is done here, principally in deals' shingles, clap-boards, railway sleepers, etc. The population may be estimated at about 7,000.

Among the other towns of the Province may be mentioned the following, varying in population from 1,000 to 3,000 or more :—

In Restigouche County, Dalhousie and Campbellton; Gloucester County, Bathurst and Caraquet; Northumberland County, Newcastle, Chatham, Douglastown, Nelson, Blackville, Boiestown and Doaktown; Kent County, Richibucto, Buctouche, Kingston; Westmorland County, Moncton, Shediac, Sackville and Dorchester; Albert County, Hopewell and Hillsborough; Charlotte County, St. Stephen and St. Andrews; Carleton County, Woodstock; Victoria County, Grand Falls and Andover; Madawaska County, Edmundston; King's County, Hampton, Kingston, Sussex, Rothsay; Queen's County, Gagetown; Sunbury County, Oromocto.

PRINCIPAL RIVERS.

The Saint John, Miramichi, Restigouche, Saint Croix, Petitcodiac, Richibucto and Nepisiguit are the principal Rivers, but the whole face of the Province is intersected with Rivers of different magnitude.

The River Saint John takes its rise in the State of Maine, between 450 and 500 miles from the sea. For some distance it forms the boundary between Maine and New Brunswick, and after running through the Counties of Madawaska, Victoria Carleton, York, Sunbury, Queen's, King's and Saint John, N. B., it discharges itself into the Bay of Fundy. It is navigable for large vessels from Saint John to Fredericton, a distance of ninety miles, but shallow bottom steamers ply as far as Woodstock, and boats run to Grand Falls during rainy seasons. It is a highway of trade during the summer months for crafts of many kinds, which on the down trips bring deals, shingles, clap-boards, etc., to market, and on the up trips articles for the use of farmers on the river sides. Large quantities of fish, including salmon, shad bass and sturgeon, are caught all along the river.

SCENERY, ETC. Wide intervals lie along this river, the soil of which is very fertile. The scenery is of the most magnificent description, ever varying in freshness and beauty. Large quantities of lumber, cut on the river and its tributaries, are driven in rafts, in spring, down the river to Saint John.

The Miramichi takes its rise in the County of Carleton and runs easterly to and through York and Northumberland Counties, and empties into the Gulf of Saint Lawrence. Immense quantities of lumber are driven down this river to supply the many milling establishments along its banks, some of which are the finest in the Province. Its lumber exports are only exceeded in New Brunswick by that of Saint John. It is navigable for vessels of the largest class from its mouth to Nelson, a distance of forty-six miles. Its natural manufacturing facilities are excellent, and their value is greatly increased by having at Newcastle a deep water terminus of the Intercolonial Railway, and the Chatham Branch Railway, intersecting the Intercolonial Railway at Nelson, affording inter-communication and connection with the outside world. During the spring and fall freshets steamers ply with little difficulty on the South West Branch, a distance of fifty miles above Newcastle, and on the North West Branch to Red Bank, as also to the mouth of the River at all seasons of the year. The branches of the Miramichi extend over and drain fully one quarter of the Province. It is noted for its fisheries : Salmon, Lobster, Trout, Bass, Smelt, etc., are exported in enormous quantities to Great Britain, United States and elsewhere during the whole year.

The Restigouche for a considerable distance forms the northern boundary of the Province (which it divides from Quebec) and discharges into Baie des Chaleurs. Much lumber is also cut and driven on this river. The harbor affords security to all vessels, for its depth of water and safety of anchorage.

The Saint Croix divides the State of Maine from the Province of New Brunswick at its south western part. Its sources is a chain of large lakes called the Cheputnecticook Lakes. A small steamer runs for twenty-four miles on these lakes up to Princetown. Considerable lumber is still cut in the vicinity of the river, but the largest part has been culled some time since.

The Petitcodiac discharges into the Shepody Bay, at the head of the Bay of Fundy, after running through the fertile and grass-growing Counties of Westmorland and Albert.

The Richibucto is the largest river, excepting the Miramichi, emptying into the Gulf of Saint Lawrence.

The Nepisiguit takes its rise on Northumberland County, near the head waters of the Tobique River, a branch of the River Saint John. It runs easterly and northerly and discharges into Baie des Chaleurs. It is not navigable for large vessels. Tourists visit its waters every summer to fish with the fly for salmon. The Pabineau Falls, nine miles from its mouth, and the Grand Falls, twelve miles farther up the river, are noted for their rugged beauty and picturesque surroundings.

The Baie des Chaleurs abounds in Mackerel, Salmon, Cod and Lobsters. There are a number of factories for packing Lobsters along its shores.

FORESTS.

The forests abound with a large variety of trees. Among the principal growths may mentioned the Spruce, Pine, Birch, Beech, Maple, Tamarac, Hemlock and Cedar.

The Spruce tree is now the most valuable of all the varieties, being the most plentiful, and most extensively used in ship building. It is also from this tree that the principal part of the sawn lumber exported from the Province is manufactured.

The Pine tree, of which there are several varieties, was in former years very plentiful, but is now comparatively scarce. It is a much finer wood than the Spruce, and the lumber manufactured from it is much sought after, from the ease with which it can be worked and from the beautifully smooth finish it takes. It is used to a great extent for the trimmings of buildings and sometimes for furnitnre.

The Birch is largely used in ship building, but when exported is generally in the form of what is called square or ton timber.

Tamarac is used in the numerous ship yards for knees, frame work, plank, tree nails, etc. It is a comparatively scarce wood.

Hemlock is principally cut for its bark, which is used in the many tanneries throughout the Province in the manufacture of leather. At present there is a great demand for this bark, and unless more stringent measures be used for the preservation of this valuable tree, before many years the supply will be exhausted. The lumber cut from this tree is now coming into more general use than formerly, being used for the inner covering of buildings. It lasts well under water and is therefore used for wharves, etc. It is also much used for stable floors.

Beech, Maple, Cedar and other varieties of trees grow in the forests, but are not of sufficient commercial value to be noticed.

RAILWAYS.

There are a number of Railway lines in the Province. Beginning at Saint John, the railway centre, and going North and East, we have the Intercolonial Railway running to Moncton and thence to Halifax, in Nova Scotia. From Moncton a branch line runs to Shediac, while the main Intercolonial Railway runs North from Moncton through the Counties of Westmoreland, Kent, Northumberland, Gloucester and Restigouche, crossing the Restigouche River, the northern boundary of the Province, at Metapedia and thence to the City of Quebec.

The Chatham Branch line connects Chatham with the Intercolonial Railway at Chatham Junction, six miles from Newcastle. Another Branch line connects Salisbury, in Westmoreland County, with Hopewell, in Albert County; another runs from Petticodiac Station to Elgin, Albert County, both feeders of the Intercolonial Railway.

Returning to Saint John, and going westward, is the Saint John and Maine Railway, connecting Saint John and Bangor, State of Maine, crossing the Western boundary of the Province at Vanceborough.

Another line called the New Brunswick and Canada Railway runs from Woodstock, Carleton County, to St. Andrews and St. Stephen, in Charlotte County, and crosses the Saint John and Maine Railway at McAdam Junction.

The New Brunswick Railway starts at Gibson, on the North-east side of the River Saint John, opposite Fredericton, and runs to Edmundston in Madawaska County. It has a branch running into Woodstock from Woodstock Junction, and another running from the mouth of the Tobique River to Caribou, in the State of Maine.

The St. Martins' and Upham Railway runs from Hampton Station, Intercolonial Railway, to Quaco, on the shore of the Bay of Fundy, in Saint John County.

Other lines are in course of construction, but not yet completed.

An idea of the Railway facilities of the Province may be thus summarized :—A traveller may leave Edmundston, in the North-Western portion of the Province, travel South and East to Fredericton, South and East to Saint John, East, North and West to Campbellton or Dalhousie, in Restigouche County, thus making an almost entire circuit of the Province, and within about forty hours of the time of starting

AGRICULTURAL PRODUCTS.

The soil of New Brunswick is capable of producing great quantities of grain and fruits, as well as root crops. Hay is grown in abundance on the "intervales" or low lands, and the yield on the high lands is from one to three tons per acre. Wheat, oats, buckwheat, rye, barley and flax grow well in the country. Potatoes, turnips, beets, carrots, parsnips, celery, lettuce, cabbage, cucumbers, pumpkins, squashes, etc., thrive in all parts. Apples, plums, cherries, goose-berries and currants are the common fruit crops, but strawberries, and raspberries are also common.

Hamilton.

Business continues brisk in the city. The cold wave of last week interfered considerably with contractors who had not quite finished their outside work, which, however, is generally about completed. Some fine buildings have been erected this season—one of the best—the Hamilton Provident and Loan, has been built by Mr. Robert Chisholm, who, has maintained in the style and finish of this building, his former reputation as a reliable contractor. The building is faced with Ohio freestone, and the sculpture and mouldings are of the best workmanship. Two columns of polished Canadian red granite, 13 feet high and twenty inches in diameter ornament the main entrance, and support the "royal arms," which are beautifully sculptured. The wood work is of the best description and expensive, as the walnut used cost from $100 to $110 per M, and the butternut from $25 to $30 per M. Machine shops and foundries have plenty of work in hand as may be seen from the following, which is ordered and under construction in the works of J. H. Killey & Co. : Steam road roller, 18 tons, for Brockville, Ont.; stone breaker, 8 tons, for same place; 40 horse-power engine, boiler and machinery for the new cotton factory, Hamilton; also finishing engine, boiler, machinery and elevator for the same; one 30 horse power engine, boiler and machinery for Winnipeg, Manitoba; one 40 horse power engine, Stephens, Turner & Burns, London; one 65 horse power engine for Mr. Fenwick's Mills, Exeter; one large new steam machine for the extension of Messrs. Campbell's sewer pipe factory, the machine will weigh five tons; new mill machinery for Bow Park farm; four steam blast apparatus for burning inferior fuel; one 25 horse power boiler for Law & Co.'s tannery, Port Dover; engine and shafting for Mr. Fearman's new factory, Hamilton.

Muskoka.

On the 1st inst., Wm. Robinson, employed in Dollar's lumber camp, Brunel, met with an accident which resulted fatally. A falling pine struck a dry hemlock, which latter fell at right angles to the pine, striking Robinson, who had believed himself to have been at a safe distance. The thigh bone near the hip was crushed, and internal injuries sustained, from which he died a few hours after.

Considerable interest has been taken in the case of Isaac Cockburn vs. M. Brennan, tried recently at the Barrie Assizes. Peter Cockburn obtained from defendant by deed all the pine timber on lot 1, con. 6, Brunel Township, Muskoka, that would make saw logs and merchantable dressed timber, and it was covenanted that he should have access to the land to cut the timber for four years from 1876. Peter Cockburn conveyed the same to John Donaldson who transferred his interest to the plaintiff. Defendant, however, resold the timber to a third peron, by whom the same was removed. The plaintiff accordingly sued for $500. The Judge assessed the damages at $318.

—Up to 24th Nov. Halifax had subscribed $3,200 and Montreal $4,000 for the relief of the Stellarton mine sufferers.

HON. WM. McMASTER.

Honourable in More Than the Mere Name.

A PRINCE AMONG MERCHANTS.

The Result of Industry, Energy, and Uprightness.

SUCCESSFUL IN BUSINESS.

A Farsighted Financier and Good Citizen—A Life Crowned with Good Works.

(From the Toronto Truth.)

Among the merchant princes of Canada, the Hon. William McMaster occupies a foremost place, and the simple record of his life may well read a lesson to all young men and encourage them in a course of well-doing. There has been nothing very extraordinary in Mr. McMaster's history, just as there is nothing overshadowingly great in his original powers of mind, or anything out of the common in his very successful and honourable career. No young man need say that the circumstances of Mr. McMaster's lot were so exceptionally favourable, or that his abilities were so entirely above the ordinary that few could hope to follow in his steps, or to look for anything like his splendid commercial success. On the contrary, there is nothing about the Honourable Senator's character, acquirements and prosperity which might discourage the young and aspiring; but something very much the reverse. Mr. McMaster

HAD TO PUSH HIS WAY

with few advantages. No extraordinary help and no exceptionally lucky turns of fortune. It could not be said that he owed anything to what some would call a mere fortunate chance, or that he took advantage of some special opportunity which, if once neglected would never again have presented itself. The secret of his success has been in steady, energetic work, prudent management and skilful attention to all the minute details of business. He has left nothing to chance, has never depended on something turning up, or reckoned upon others going out of their way to help him when he knew that he could help himself. Prudence, tact, energy and skilful management account for all that he has accomplished.

NOT FORGETTING THE BLESSING OF GOD,

which he would himself be the first to acknowledge, and to which he would be the readiest to ascribe all he is and all he has achieved.

A native of Ireland, where he was born in 1811, Mr. McMaster came to Canada when twenty-two years of age, and immediately set himself to the work which he has ever since so successfully prosecuted. His educational advantages had not been very many or very great, but he had made the best and most of them, and, full of youthful energy and hopefulness he entered upon commercial work,

RESOLVED TO SUCCEED,

but only by legitimate means, and in regular honourable undertakings. He was at first engaged as clerk in a dry goods store on King, nearly opposite Toronto street, but he could not long remain in that position. Within a year after his settling in Toronto he had become

A PARTNER IN THE CONCERN,

and very shortly after, had started as a wholesale merchant on his own account. At first, of course, he had very considerable difficulties to contend with. Montreal was the great distributing centre for Canada, and continued to be so for many years after. The merchants there had all the advantage arising from an established trade and settled business facilities, and it is not saying too much to add that they looked with no favourable eye upon any such attempts as that of Mr. McMaster which aimed at making Toronto, not Montreal, the great wholesale centre for the West of Canada. The covert jealousy and keen competition of Montreal, however, only stimulated a man like Mr. McMaster to greater exertion and made him the more

DETERMINED TO SUCCEED AT ALL HAZARDS.

He turned the peculiar advantages of Toronto to the best account; made it worth while for the merchants of the West to deal with him, and soon established a large and even growing connection, which for many years, first under himself and thereafter under his nephews, whom he had taken into partnership and who have carried on the business since he retired, has been among the largest and best known in all the Province of Ontario if not in the whole of Canada.

Very homely yet not so very common instrumentalities have been employed to build up and maintain the large and lucrative business. They may be all summued up in fair dealing, prudent management, untiring energy, courteous conduct and watchful attention to the smallest details. Mr. McMaster has never had any faith in sharp practice, questionable pretences or more than questionable make-believes. He established a character for fair, honourable dealing, kept the best of goods, gave the best terms which were prudently possible, and watched every opportunity for honourably pushing his business and profiting by the changing chances of the market. His customers learned to rely upon him. His name rose for

UPRIGHT AND HONORABLE DEALING,

and, within a comparatively short time his transactions extended over the whole country, and were, as such transactions ought always to be, mutually advantageous to all concerned. What the firm was, in the days when Mr. McMaster was at its head, it still continues to be, occupying to this day a foremost place among the many establishments of this kind now to be found in Toronto, and is, we believe doing if not the very largest business in its particular department, one of the safest and most lucrative.

A man of Mr. McMaster's energy could not remain idle, even after he had no special call to exertion. It is now many years since he entirely retired from the Dry Goods business and found himself so far, a gentleman at large. Instead, however, of his business life closing when a respectable competency had been secured, it may be said that it only then really commenced. He has since made himself a still greater name and power in the realm of Finance, than ever he was in that of Commerce. As director of various banks and other monetary institutions he has shown

THE SAME SOUNDNESS OF JUDGMENT

and caution, combined with enterprise, which gave him success in his original occupation. No undertaking with which he has been connected, has failed to reap large and satisfactory benefits from his wise and careful administration. But it has been in connection with the Bank of Commerce that his peculiar abilities have had chief scope, and have achieved their greatest success. That large and flourishing enterprise, may be said to owe almost all its prosperity to the untiring attention, admirable business habits, enlarged experience, and keen discernment of its President. It has been his favourite work, and he has reaped special celebrity and profit from his connection with it from the beginning. Indeed, there is no institution in Canada,—we had almost said —or on the Continent, whose history and success are so intimately connected with one man's name, and which are known so generally as having become what they are through the skilful management and undomitable energy of a solitary individual.

The Bank of Commerce will not go down when Mr. McMaster dies, but it is safe to say, that, but for him, it would never have occupied the position of prominence and power which it holds at present.

But it is not merely—we had almost said not chiefly—upon his success as a business man, that Mr. McMaster's wide spread reputation throughout the Dominion, rests. He has never been a very ardent or prominent politician, though, in the course he has followed as such, he has always displayed the same sound judgment, and unimpeachable integrity. As a public spirited citizen, however, an ardent christian, and an enlightened philanthropist, Mr. McMaster is most widely and most favourably known.

He has in many different ways sought the good of the land in which he lives, and in which he has achieved his great success. Toronto has benefited in many respects from his labours, and the religions denomination of which he is a member has long received from him munificent and and sustained assistance in all its varied enterprises for the advancement of the cause of Christ. What he did in connection with the building of

JARVIS STREET BAPTIST CHURCH

is well known. We should suppose that forty or fifty thousand dollars would not fully represent all he gave in money alone, besides the trouble and personal effort he cheerfully expended in the course of the work. His efforts for the upbuilding of the Literary Institute at Woodstock have been on a similar scale of enlightened munificence, while his last undertaking in erecting the splendid buildings in the Queen's Park for the Baptist Theological Seminary, and, in so far endowing it, also will likely throw all his previous efforts into the shade. It is well that Canada has such men,—men who have abundance of means and at the same time hearts to use them for

HIGH AND PERMANENTLY USEFUL PURPOSES,

men who do not hold on to their gold with death-like tenacity till the great king of terrors makes them unloose their grasp, but who take pleasure in so far being their own executors and in having the joy of seeing in their life time the blessed fruits of their wise arrangements and unstinted liberality. The amount of happiness which Mr. McMaster must derive from such undertakings cannot but be very great, and such as, if that were allowable in any case, onlookers might well regard with something like envy. What a contrast in every respect his career and his reward, even in mere personal pleasure, compared with what those can have who give themselves up to mere selfish accumulation, and who give way to that kind of pride, which one has said, "raises the loudest laugh in hell,' the pride of dying rich. Mr. McMaster is a modest as well as a wealthy man, and can ill stand to have his good deeds blazoned before the public. He is one, however, whom his fellow citizens delight to honour, and whom young men may safely copy. He is not a man of genius, and cannot even be said to be a man of any very distinguished abilities. But he has great good sense, large practical wisdom, indomitable perseverance, shrewd discernment of character, unswerving integrity and genuine,

UNOSTENTATIOUS PIETY.

No one envies him his success for he bears himself with modesty and uses his wealth for high and honourable purposes. That he may be long spared in a green old age to enjoy the fruit of his labours, to devise liberal things for the good of the race, and to still further help forward the cause of truth and righteousness on the earth, is the cordial wish not only of TRUTH, but of all to whom the interests of *the truth* are dear. The accumulation of a very large amount of property in the hands of single individuals is not at all a desirable thing, though it is not easy to see how it is to be prevented so long as some are industrious and shrewd, and others are improvident and wasteful, as well as idle and foolish. But if there were more of those generally spoken of as successful, who would follow a course somewhat similar to that of Mr. McMaster, their prosperity would be less envied, and their meaner characteristics less remarked upon. We have in this new country not many who could, if they were willing, expend their means on such a scale of princely munificence as Mr. McMaster has done, and is doing. We have still fewer who are willing to do this, even though they could. That the number of such will increase we sincerely hope, and that all of them will receive as much honour and derive as much unalloyed pleasure as Mr. McMaster has done we most fully believe. The great heart of the people is after all not very far from being just. It is true now, as it always has been, that if a man will only persist in doing what is right and fair and true, right will continually be done to him in return.

Kings in Exile.

The Duc d'Aoste, the whilom King of Spain, is staying at Venice, where he delights the boatmen and fishermen of the Lido by his wondrous performances as a swimmer. They say he is the most accomplished master of the art in Europe, excelling most particularly as a diver. He now and then astonishes the gondoliers by throwing into a gondola the broad straw hat he always wears to shield his face from the sun, as he lies upon the surface of the water; then, diving below, comes out on the other side, snatches the hat, places it on his head again, and remains stiff and motionless as before. The ex-King and Queen of Naples are staying at Benzeval, in Normandy, living the most quiet and unobtrusive life possible. The Queen, who possesses the same love of riding on horseback as her sister, may been seen in the early morning cantering along the sands on one of the ponies belonging to the place, without any other attendance than that of a lady friend who has accompanied her majesty throughout all her troubles and misfortunes. The Queen still preserves her youthful appearance, and the beauty which once formed the theme of many a Neapolitan *improvisatore's* spontaneous effusions as she passed through the streets of Naples. The King, on the contrary, has grown stout and heavy, moves with difficulty, and remains all day seated on the *plage*, content to breathe the sea air, and evidently enjoying the quiet of the place; sometimes he strolls along the public walk, leaning heavily on his cane, and supported on the arm of his friend, the Count de la Torre, but he seldom takes a drive beyond the limits of Benezeval, and never rides on horseback.

The crisis in Ireland may issue, at any moment, in bloodshed. It is nonsense to say that it will end in civil war. It will do nothing of the kind. It is terrible to think how unreasonable and absurd some people can be. What possible claim can the tenant farmers of Ireland have, to be made owners in fee simple of their different holdings, and that at the expense either of the present landlords, or of the general public of the three Kingdoms; while the first thing to be done by the new race of land owners, is to cut Ireland adrift from those who have paid the heavy end of the purchase money, and allow them not even consideration for the liberality they have shown? It seems funnily absurd. And what right has a man that ploughs to be made a freeholder, any more than a man that smites the anvil, or a woman that spins? And then to think that when they have got a Government that is pledged to, and eager for legislative amelioration all round these pig-headed fellows should by the grand rows they are kicking up, making it impossible for that very Government to look at measures of reform as long as it has to strain every nerve in the first place for the maintainance of the peace. If it were not to be thought offensive, TRUTH would say that it was immensely Irish all over.

QUEER HAPPENINGS.

COWS AS A STORM GUAGE—SPIDERS FOR COMPANIONS—A MIGHTY QUEER WATERMELON.

THERE is a young mother in Portland, Oregon, whose age is but 12, weight 85, yet her infant son weighed nine pounds at its birth.

A LARGE bird at Keokuk, Iowa, darted swiftly downward in its flight, and striking a lightning rod, the iron run through its body, and it remained impaled, fluttering and struggling until death came.

A WOMAN in Marshall County, Kansas, who is enjoying her fifth husband, lost her first two by hanging through vigilance committees, a third was sent to the penitentiary, and the fourth committed suicide.

As Jared Dingman was shaking $1,500 in gold under the nose of a steam tug owner in the Detroit river, endeavouring to tempt him to take that amount for his boat, the tug struck a steamer and the glittering gold was the property of the fishes.

A WISCONSIN cow with a persistent cough that baffled the skill of a veterinary surgeon to cure, died, and upon opening her windpipe to discover the cause of the irritation there was found in the upper part of the lung a live striped frog of ordinary size.

ELEVEN children at four births was the feat of Mrs. Scannel Hickson of Shamrock, Mo. First birth, three; second and third, two each, and at the last interesting occasion there were four, all the latter being alive and doing well. Ten out of the eleven are alive.

IN Richmond, Va., an old coloured woman has been going to the depot daily for many years to meet the incoming trains, looking for a letter containing $25. After the war she did the washing for a soldier, and when he went away he declared that he would return and bring the money or send it in a letter.

AN event probably without precedent in railway annals has just happened at Provins. A passenger train leaving Paris at 8:20 p.m., arrived safely at its destination, but on getting down to let the passengers out of the cars, the guard was astonished to find neither passengers nor passenger cars on at Paris.

WHILE riding horseback, John Eller of Alden, Iowa, saw coming from the sky a ball of fire, apparently about the size of a flour barrel. He was paralyzed with fear, and saw the globe strike the head of the animal he rode, when he fainted. Upon coming to his senses he found that the horse was dead, the head of the animal being seared as if by a red-hot iron.

THE queerest companions for a man are those of an old man in New Orleans. He has a mania for spiders and in his rooms are more than 500 of every shape and colour. The ceilings are hidden by the webs that they have spun. Occasionally the old man throws a handful of flies into the webs, and is greatly delighted at seeing the spiders seize their struggling victims.

AN aged and wealthy Milwaukee widower found a wife by a queer method. In a coffee-grinding mill in Chicago a female packer placed in several bundles of coffee a card saying that any gentleman matrimonially inclined might address her. This widower found the card while preparing his lonely breakfast after a quarrel with his housekeeper, and now the Chicago girl is Mrs. ——.

AN Italian fisherman recently discovered a petrified woman at Cascad Lake, Nevada. He was going out to fish, and when pushing off his boat, struck his oar against something which attracted his attention. Upon investigation a petrified hand protruded from the sand on the beach. In a short time he had unearthed a woman in a complete state of petrification. It was small in size, brown in colour, scrawny and emaciated.

NEAR the camp of the workmen on the new toll road, near Yankee Forks, Nevada, quite a curiosity was recently found. It was a mountain ram's head deeply imbedded in a pine tree, and about six feet from the ground. The right horn is outside, and curls partly around the tree, while the front of the skull and most of the left horn is covered with the growth of wood. The tree is a thrifty pine, fifteen inches through. How that ram's head came there will always be a mystery to scientists.

About midnight, just after the accident in the Consolidated Imperial Mine, Nevada, the wife of Matthew Winnie was found on her way to the works. She said she had been awakened just before by her husband, who came all mangled to her and told her that he had been killed in the mine. She got up, dressed herself, and started to ascertain the truth of what she was only too well convinced was true. There had in reality been a fearful accident; Mr. Winnie was indeed killed, and the trembling woman went back to her children and her desolate home.

As John B. Coyner, a farmer residing near Palestine, Ind., was watering nine cows at a pump trough, recently, they made a stampede down the lane as fast as their legs would carry them. The cause of this sudden freak was a mystery to the hired man, but it was not long before he was let into what appeared to be the secret of the stampede. Suddenly, although the sky was clear and the atmosphere still, a young cyclone, not over twenty feet in breadth, darted down the sky, and, striking the earth near the pump, twisted off five large beech trees as though they were weeds.

IN Lincoln County, Nev., there is a spring of ice-cold water that bubbles up over a rock and disappears on the other side, and no one has been able to find where the water goes. At another point in the same county is a large spring, about twenty feet square, that is apparently only some eighteen inches deep, with a sandy bottom. The sand can be plainly seen, but on looking closer it is perceived that this sand is in a perpetual state of unrest, and no bottom has ever been found. It is said that a teamster, on reaching this spring one day, deceived by its apparent shallowness, concluded to soak one of his wagon wheels to cure the looseness of its tire. He took it off and rolled it into the, as he thought, shallow water. He never laid his eyes on that wagon wheel again.

The Rights of an Organist.

The question as to the exact status of the organist, of his rights and wrongs, and of his privileges and duties, has often given rise to discussions, says a writer in the *London Opinion*. What with clergymen who know nothing of music, but who unfortunately think that they do, and members of the congregation eager to give advice which they have not tested, the seat in front of the keyboard is not always too comfortable. As a case in point, and as further illustrating our remarks, we are informed that at a dissenting place of worship not a hundred miles from Liverpool, the other Sunday evening, a member of the congregation—himself a professor of music and an organist—was invited to fill the position of the regular organist, who was absent. All seemed to go most satisfactorily until the last hymn, before the reading of which the minister publicly expressed a wish that the hymn might be sung softly, and "with but little strength of organ." The organist, exhibiting the courtesy of a gentleman, bent to the request of the worthy clergyman; but after the service this ill-advised and injudicious public remark was severely commented upon by the congregation. As a rule, the clergy know very little about organ-playing, although they not unfrequently assume a knowledge which is not warranted by facts. We shall next hear of the selection of stops being taken out of the organist's hands.

Mining Operations in Great Britain

The report of the Inspector General of Mines in Great Britain for 1879 has just been published. The number of persons engaged in mining operations in the United Kingdom was 523,870. The total number of serious accidents amounted to 843, and the total of deaths resulting 1,037, a diminution as compared with 1878 of 39 in the number of accidents and 453 in the number of deaths. There was an average of one accident for every 621 persons employed, and a death for every 505 persons.

In the twelve districts under the Regulation Act of 1872, for the coal mines 476,810 persons were employed in or about the mines of whom 385,178 were below the surface, and 91,631 above; of those above 4,842 were women.

The products of the mines for the year were: 133, 720,393 tons of coal; 9,387,766 tons of iron ore; 1,455,003 tons of potter's clay; and 803,207 tons of mica. The amount of coal produced was 1,108,330 tons more than in 1878, while the other items were less by the following amounts: iron ore 1,359,461 tons; potter's clay, 170,583 tons; and mica, 10,055 tons.

Some Homœopathy.

[Appleton's Journal.]

In the discussion between a "skeptic" and a "believer" in infinitesimal doses, it was discovered that a drop of mother-tincture put through thirty decimal dilutions would require for the purpose the contents of nearly 16 quadrillion reservoirs of the capacity of that in Central Park. Inasmuch as it is simply impossible for the human mind to grasp a number so large as this, it would have been well had an effort been made to express the amount of liquid required in larger bulks with fewer numerals. One of the speakers asks if there can "be so much fresh water on the continent," which is proof of the little idea he entertained of the amount of water that such a number of reservoirs would contain. Let us see what can be done to make more obvious what those figures really mean. We do not know the area of the Central Park reservoir, but by consulting the map we find that it is half a mile in extent in one direction, a little less in the other, and that it tapers somewhat toward one end. If we estimate, therefore, that a sqaare mile would contain five such reservoirs, we are pretty close to the facts—sufficiently so for our present purpose. The geographers estimate the entire surface of the world to be about two hundred millions of square miles. The surface of the world is then capable of containing one billion of our reservoirs. But we want space for 15,873,015,873,015,873 reservoirs, and to hold this number it will be found that we should absolutely require 15,873,015 worlds and a fraction. The Croton Reservoir, however, is comparatively shallow, perhaps not more than 50 or 60 feet deep—let us say fifty feet. Now, if we deepen our billion reservoirs, standing on the surface of the globe, until they extend downward to the centre, becoming, say, 4,000 miles deep, which is about one-half the diameter of the earth at the equator, we shall increase their capacity some four hundred and twenty two thousand times (that is, we should do so if their area were uniformly maintained,) so that, if the world were composed wholly of water, it would require, at the very least, roughly calculated, more than forty such worlds in order to obtain one nonillion drops of water; that is, to put the mother-tincture through 30 decimal dilutions. If the world were a cube instead of a sphere, a tolerably exact calculation could be given; it would then require nearly 38 worlds of water; as it is, if we say 45 we shall understate the number, but a few worlds of water more or less are of no moment. Now, it must be remembered that for every dilution we must multiply the preceding number by ten. It would thus require 450 worlds of water for the thirty-first dilution; 4,500 for the thirty-second, and so on, the fortieth dilution needing 450,000,000,000 worlds of water! If the 20,000,000 stars which the great telescopes reveal in the heavens were all composed of liquid, they would not nearly supply water enough, unless averaging 22,500 times larger than our world, to put one drop of tincture through 40 dilutions—and yet people are constantly cured by doses of the one-hundredth dilution.

Preserving Timber in Ground.

In speaking of the well known methods of preserving posts and wood which are partly embedded in the earth, by charring and coating with tar, it is said these methods are only effective when both are applied. Should the poles only be charred without the subsequent treatment with tar, the charcoal formation on the surface would only act as an absorber of the moisture, and, if anything, only hasten the decay. By applying a coating of tar without previously charring, the tar would only form a casing about the wood, nor would it penetrate to the depths which the absorbing properties of the charcoal surface would insure. Wood that is exposed to the action of water or let into the ground should first be charred, and then, before it has entirely cooled, be treated with tar till the wood is thoroughly impregnated. The acetic acid and oils contained in the tar are evaporated by the heat, and only the resin left behind, which penetrates the pores of the wood and forms an air-tight and waterproof envelope. It is important to impregnate the poles a little above the line of exposure, for here it is that the action of decay effects the wood first, and where the break always occurs when removed from the earth or strained in testing.

A light affair—a lamp.

GRINS.

A GOOD thing to re-collect, if you can—debts.

IT don't take a very fast horse to catch epizootic.

A POOR rider always has an eye on the mane chance.

THE writing-master usually does a flourishing business.

A FRIEND asks us what a whale says when he spouts. He tells some kind of a fish story, probably.

WHY is the discovery of the north pole like illicit whisky manufacture? Because it's a secret still.

THERE is romance in figures. A young man met a girl, 1er, married her, and took her on a wedding 2er.

A WAG suggests that a suitable opening for many choirs would be: "O, Lord, have mercy on us miserable singers."

PEOPLE who take moonlight strolls on railroad tracks shouldn't be offended if the coroner doesn't recognize them.

WHEN a dog gets his head fastened in a fence it is unsafe to extricate him unless you enjoy the pleasure of his acquaintance.

"CIRCUMSTANCES alter cases," said an unsuccessful lawyer, "and I wish I could get hold of some cases that would alter my circumstances."

AN instance of Dr. McCosh's shrewdness is given in *The Princetonian*: Student after class. "Did you mark me absent, doctor?" "I did, sir; and what's your name?"

VAGARIES of fashion:

When lovely woman is not jolly
But hides some secret grief within,
What art can cure her melancholy?
Seal's kin.

"MY son," said an American father, "how could you marry an Irish girl?" "Why, father," said the son, "I'm not able to keep two women, and if I'd marry a Yankee girl I'd have to hire an Irish girl to take care of her."

THE Detroit *Free Press* man thinks kissing pretty girls must be frowned down. He'll find that it takes a pretty powerful frown to stop it., and we doubt if he won't have to sail in with a club besides, to successfully interrupt the fun.

AN English doctor says that people troubled with heart disease are more likely to die at midnight than any other time, especially if they are sound sleepers. Get up and shake down the coal stove at 11:45 and you'll be all right.

The New York *Graphic* says the Bernhardt went to the Italian opera and entered quietly, which won her many friends. Did the *Graphic* expect she would go to the theatre headed by a brass band and a torchlight procession?

Apropos to the discussion of sense-perception:

The pharynx now goes up
The larynx with a slam
Ejects a note
From out the throat
Pushed by the Diaphragm.

"How are you Brown? Haven't seen you for an age." "No, we haven't met for months. By-the-way you've lost your wife since I saw you last. Very sorry. Terrible blow for you!"; "Yes; very sad, wasn't it? I can scarcely realize at times that I'm married again!"

DOM PEDRO, Emperor of Brazil, wished to test a certain railroad brake. He had one adjusted to a car, and started off for a trial trip. The engineer soon saw what seemed to be a big rock on the track ahead, and applied the brake, stopping the train within a few feet of the obstacle, which proved to be pasteboard.

A Jersey, like a coat of mail,
The shapely form incases,
And to a daints waist can't fail
To add developed graces;
To draw it on requires a knack
Quite easy to attain,
But what a business 'tis, good lack,
To get it off again!

"DISTURBANCE!"—Country banker to shakey customer: "Are you aware, Mr. Soolivan, that your account is overdrawn a hundred or so?" Soolivan: "Certainly I am, sir. Don't bother me about such thrifles! I don't go howling about the country when you've a hundred or so of mine! Your information is superfluous either way! Good morning, sir!"

MARKET REPORTS

CANADA LUMBERMAN OFFICE,
TORONTO, 27th Nov., 1880.

Owing to the continued cold and stormy weather but little progress has been made in exporting lumber for the past two weeks. There are some three or four cargoes yet to ship, which must remain over until spring, unless a favourable change of weather should set in. The Toronto Bay is partly frozen over, and tugs find it hard to force their way through. Lakes Couchiching and Scugog have been frozen over a week ago. The Muskoka Lakes, although farther north, are open, but the steamers have now ceased running. The Grand Trunk have advanced freight rates to all parts of the Dominion. The Lumberman's *Gazette*, Bay City, of Nov. 22, says :—"Mills have all shut down. Winter took a snap judgment on nearly everybody, and nearly all have suffered more or less. There is quite an amount of lumber left on the docks. Trade for a time will remain at a standstill. Business is expected to be quite brisk by rail and dealers are looking forward to a good trade." Our home market prices remain unchanged, and Hamilton and Toronto prices range about alike. At Quebec there is little change, as will be seen on reference to our correspondent's letter. From Chatham, New Brunswick, our correspondent writes, "Our fleet of sea going vessels is now reduced to 6 and as there is no likelihood of more arrivals this fall our several mill wharves will soon assume their winter inactivity.

ST. LOUIS HOTEL.

THE RUSSELL HOTEL CO., Proprietors.
WILLIS RUSSELL, Pres., Quebec.

This hotel, which is unrivalled for size, style and locality in Quebec, is open throughout the year for pleasure and business travel.

THE RUSSELL HOUSE,

OTTAWA,

JAS. A. GOUIN, - - Proprietor.

IS THE

Favourite Resort of the Leading Public men of the Dominion attending the annual Sessions of Parliament.

Ministers of the Crown, Senators, Members of Parliament, Public Officials, as well as those having business with the various Departments of the Government. It is also the head-quarters of those having dealings with the princely Lumber Manufacturers in the great Pine Valley, of which Ottawa is the acknowledged centre.

THE RUSSELL HOUSE being central, almost abutting on the magnificent PARLIAMENT and DEPARTMENTAL BUILDINGS—the pride of the Country—is thus conveniently situated for those visiting the City on public business. But the location is also everything that could be desired alike for the man of business and the man of pleasure. A few minutes walk brings the guest of the Hotel within reach, not only of all the principal business resorts, but also of the most splendid Mountain and Valley Scenery that can be seen anywhere, as also of the two almost unrivalled Waterfalls—the Chaudiere and Rideau—and of the extensive Manufacturing Establishments and Depots of the leading Lumbermen. But, besides the beautiful scenery, which, it may be mentioned, includes the magnificent Ottawa and two of its grand tributaries—the Rideau and the Gatineau—there are in the immediate neighborhood, beautiful Lakes and apparently never-ending woods, which afford opportunities for the finest Fishing and Shooting that can be obtained on the Continent.

THE RUSSELL HOUSE affords excellent accomodation for 300 guests; its table is abundantly supplied with Viands of the choicest description, in season, and nothing is left undone to make every visitor feel comfortably "at home."

☞Omnibusses meet the Arrival of every Train and Boat.

HEWITT & CAPELL,

GENERAL WOOD WORKERS,

'THE ECONOMIST

Financial, Railway and Mining Journal.

BOSTON. PUBLISHED WEEKLY. NEW YORK.

$3.00 a Year. 10 Cents a Copy.

THE ECONOMIST IS DEVOTED exclusively to the Financial, Railway, and Mining Interests of the United States. It is the representative journal of its class in New England, and has, by its conservative and independent policy, established a reputation and circulation which give it a commanding influence in its section. It aims to advance and protect the legitimate mining industry, and to guard investors from imposition and consequent losses.

THE ECONOMIST presents special inducements to advertisers through which to reach the wealthy classes of New England. Its circulation among the Mining States and Territories is large and rapidly increasing.

Specimen copies free.

Wm. MACKIE, Proprietor.

The Book Agent.

A SCHOOL FOR THE INSTRUCTION OF WILY CANVASSERS.

From the Cincinnati Gazette.)

Prince—"What is the book for which you canvass?"

Pupil—"The History of the Bible."

Prince—"What does it cost?"

Pupil—"Seven dollars and——."

Prince—"Naw!"

Pupil—"Two cents a day."

Prince—"Yes. How many numbers!"

Pupil—"Twenty-nine. Delivered every two weeks."

Prince—"How many numbers are ready for delivery, and when do you mention the fact?"

Pupil—"Four. After the subscription is taken."

Prince—"Good! Now, how will you carry your prospectus?"

Pupil—"I'll wrap it up in paper and keep it nice and clean."

Prince—"Naw! Clean! They ain't old enough looking. You start out, you see my friend, with a good subscription list already taken. You show it—you needn't say they were taken in Cincinnati—we are ladies and gentlemen—we never lie. Naw! You don't carry it rolled up in a paper or in a sack. You don't carry it in your hand or under your arm—you carry it here."

The Prince slipped it dexterously beneath the breast of his coat, snugly buttoned it in. "Naw! we are gentlemen and ladies on the street. I don't have any one else work for me, and you, miss, will put yours under your cloak. I had one lady who used to slip hers right under her bustle. Now you are going to call. How do you know Mrs. Rose is the lady of the house?"

Pupil—"Oh, I could find that out in the last house."

Prince—"Of course you could, and how many children she has, and what her husband does for a living, and you may get an inkling of what church she belongs to; but cautious, you know cautious. When you ring the bell and the servant comes to the door what would you say?"

First Pupil—"I would ask, is the lady of the house in?"

Prince—"Naw. What would you say?"

Second Pupil—"Is Mrs. Rose in?"

Psince—"Naw! She would tell you that Mrs. Rose is not in, and Mrs. Rose would hear her say so. They teach their servants to lie. Ladies and gentlemen, they all do it. What would you say, Miss?"

Third Pupil—"Be kind enough to tell Mrs. Rose that a lady wishes to see her,"

Prince—"Naw! That would be true, but not politic. The servant would tell you to call again when Mrs. Rose was in. You never would find Mrs. Rose. You would, sir, step into the hall, place your hat on the rack, say very coolly to the servant, 'Tell Mrs. Rose Mr. N. J. Hall wishes to speak with her;' then walk into the parlor and take a seat. The servant will be sure you are a gentleman and an old acquaintance. She will say, 'Yes, sir,' with a simper and a smile, and trot off up stairs without a word. Then if you listen you will hear them above:

"'Why, who in the world is N. J. Hall? I'm sure I don't remember him. Has he got anything with him?'"

"Now, if you had your book in your hand, eh?"

"No, mum; he hasn't got anything."

"She doesn't come and say: 'Mrs. Rose is indisposed to-day, sir,' or, 'Mrs. Rose is engaged.' A lie, you know, but it settles your hash. Naw! She doesn't, but if she is very suspicious the servant will come down and ask the nature of your business upon which you wish to see Mrs. Rose. Now, what would you tell her?"

Pupil—"I would tell her—tell her—I don't know what I should tell her, but I shouldn't tell my business."

Second pupil—"I should tell her that I would rather not mention my business to any one except Mrs. Rose."

Prince—"And she would send the servant down once more to tell you to call again. Naw! You would tell her that you had called upon a matter concerning the welfare of her children. Don't you see, they are at school; she doesn't know but that something very serious has happened or is about to happen—that will bring her every time. She'll come down stairs, if she happens to be a little nervous, with her heart in her mouth. She'll run to meet you. Now what would you say when she comes?"

Pupil—"Why, I should take out my prospectus and begin talking the book."

Prince—Naw! You wouldn't frighten her away; you wouldn't shove the book under her nose the first thing. You would engage her in conversation. You are a gentleman; she is a lady. You would bow politely. 'Mrs. Rose, I presume.' 'Yes, sir, I am Mrs. Rose.'" 'I have called on behalf of the children (mark you, the children, not your children, now). The country, madam, is flooded with dime novels, sensational stories, an unlimited amount of trash'—

'Yes, sir; but my children are not permitted to read such things.'

"'Very true, madam. Pardon me, I can readily see that you are a lady of too excellent judgment to permit it, if you know it; but the temptation is before them always. This literature perverts their emotions, ruins their morality, and sows the seed of religious skepticism,' etc. Then you can take out your book and show the beautiful pictures. 'Only two cents a day, madam; think of that. Purely nonsectarian, a grand effort to interest the children in the history of the Bible,' etc., etc. If there happens to be a young child in the room you can turn to this magnificent picture by Gustave Dore of Moses in the bullrushes, and remark upon the resemblance of the child to the youthful Moses, and then go on talking the pictures and the stories. Never ask her to subscribe; she'll do it when you've talked long enough.'

Attitude of the Clergy in Ireland.

Too much praise cannot be given to the Roman Catholic Clergy in unhappy Ireland for the bold stand they (or the majority of them) have taken against the suicidal action of the Land Leaguers. Archbishop McCabe in a recent pastoral strongly condemned the use of violence in obtaining redress of the grievances under which, beyond question, the people are labouring, and quoted the great O'Connell in support of his position. The great agitator—of whom (as was wittily said by Labouchere) Parnell is but a *papier mache* imitation—lost no opportunity of counselling the use of legal means to obtain what the people of Ireland craved, and he denounced in the most unsparing manner the use of the very means that Parnell is advocating with all his might. There is the truest wisdom in the policy adopted by the R. C. Clergy in this matter, for in a country where the hatred of the creeds runs so high, the most terrible results would inevitably follow if the movement became identified with Roman Catholicism. It would certainly result in a general uprising, both of Protestants and Catholics, and a repetition of the wholesale massacres that have already stained Ireland's history. In strong contrast to this policy on the part of Archbishop McCabe was the imprudence of Archbishop McClosky, of New York, who identified himself, to a certain extent, at least, with the Irish agitators who visited America, and was said thus to have incurred the anger of the supreme Pontiff. It remains to be seen how the prosecutions of the Parnell party will eventuate, but there is every indication on the part of the government of adopting the most vigorous repressive measures, and, when they are driven to that course, there can be but one issue—the quenching in the blood of poor misguided peasants of the flume that Parnell has so rashly kindled.

A WONDERFUL BLIND MAN.—A very remarkable blind man, named John Metcalf, a native of Manchester, was living at the beginning of this century; and, strange to say, his occupation was no other than that of a guide, his living being gained by his conducting strangers through intricate routes during the night or when the roads were covered with snow. Stranger still however was the calling which he subsequently followed, and this we are told was that of a "projector and surveyor of highways in difficult and mountainous parts." With the aid solely of a staff which he carried, he was often to be seen traversing roads, mountain hills, and exploring valleys. It was under the direction of Metcalf that many of the roads over the Peak in Derbyshire were altered; and he also designed and superintended the construction of a new road in the same neighbourhood, formed with a view to open a communication with the great London road without the necessity of passing over the mountains.

A LADY remained too long on a train to kiss a friend, and, trying to get off after it was started, was thrown violently on her face. "If ever I kiss anybody again!" said she vengefully, as she arose—"any woman, at least," the thoughtfully added.

A BUCKS COUNTY, Pennsylvania, man has just ended a lawsuit of forty-two years' standing, and recovered six cents damages.

PROMINENT PEOPLE

THE Czar has asthma, and it continues to get worse. He will not likely live long.

THE Prince of Wales has just gained $25,000 on the turf. It's turf on the other fellows.

Ex-King Amadeus is now on a tour in England, buying up horses for the royal stables of Italy.

WHILE a Leadville lawyer was cross-examining a woman who was in the witness-stand, she exclaimed: "I'm a lady, and, by thunder, don't you forget it."

SNOW has not been so deep in the far west at this early date for years before, and old settlers are arranging to put their whisky-jugs where they won't freeze.

COUNT Taaffe, the present leader of the Austrian Ministry, is by descent an Irishman, not a Welshman, as his name and the old nursery ballad might suggest.

THE ballad-singer sighs because "there are no birds in last year's nests." It is a great pity. The poet will next cry because there are no clams in last year's shells, no woodchucks in the old-time holes.

PATTI doesn't like Wales because the poachers kill rabbits on her estate and then have the audacity to sell them to her own servants. It only indicates a popular preference for Welsh rabbit over an Italian Patie.

In Russia, all the sons and daughters of princes inherit their title. They are consequently, as numerous as sparrows. It is said that there is a village where every inhabitant is a Prince or Princess Gallitzen. The title of Prince in Russia is about equivalent to that of Esquire in England.

IT is wonderful how short-lived is Parliamentary fame in England when the prominence it gives at the time is considered. Thirty years ago Col. Sibthorpe and Joseph Hume were names as familiar in the United Kingdom as Gladstone or Disraeli. To day not one man in a hundred knows who they were.

The Czar of Russia, like many of his subjects, has suffered greatly from a nervous affection of the eye, which threatens to become very serious. By the use of a simple remedy prescribed by his oculist some relief has been obtained. The remedy consists in throwing into the eye or upon the lids a tiny jet of water by means of the eye-fountain or douche. The delicate spray is both restful and invigorating to weak or weary eyes.

YOUNG King Alfonso is no sluggard. Up with dawn in winter and before seven in summer, he reads, and works, and holds his councils before noon. He reads foreign as well as Spanish papers, and receives daily the London *Times*, *Independance Belge*, *Les Debats*, and other journals. He likes to read English history, and says very bluntly that he would fain seek his models in countries like England, Italy and Belgium.

IT is reported that Lord Dufferin will shortly be appointed Ambassador at Constantinople. Mr. Goschen's health, never very robust, has been much impaired by the worries and anxieties inseparable from contact with Ottoman intrigue, and nothing but loyalty to duty prevented his return to England long ago. Lord Dufferin is not enamoured of St. Petersburg, though diplomatically a success there, and his nomination to the Pera appointment will give great satisfaction.

THE Prince of Wales and his duns are to become again the subject of British inquiry and legislation. One of the reigning sensations of London is the report that Mr. Gladstone has been requested by the queen to ask parliament for a grant of $200,000, to help the prince pay all such of his debts as are considered pressing, and for an addition of $50,000 a year to his royal highness' allowance, which would give him $200,000 a year, irrespective of the net revenues of the duchy of Cornwall, which amount to $350,000 annually, and the allowance of the princess, his wife, which is $50,000.

THERE is joy in Burmah, just now, for one of King Theebaw's consorts has quite recently presented that monarch with a son. Mother and child are doing well. The happy father is so elated by the achievement of his spouse, Su Huayah Lut, that he has announced his intention to wed her younger sister forthwith. As he has put to death nearly all his relatives having any claim to the succession, his Majesty cannot be too fervently congratulated upon the acquisition of an heir, from cutting whose throat he will probably be deterred by the feelings of a father and the interests of a dynasty.

PRINCE ALEXANDER, the present ruler of Bulgaria, having recently come into a legacy of a million and a half dollars left to him by the late Empress of Russia, his aunt by marriage, is about to build a splendid palace in the new quarter of Sofia, at the east end of that city, where several large and handsome houses are in course of erection for the future accommodation of Bulgarian rank and fashion. The youthful Hespodar is just now in a lucky vein. Only the other day Bishop Gligor presented him with a tastefully laid-out park, about half an hour's drive from Rustchuk, eminently suitable for a summer retreat; and the Prince, while gratefully accepting this munificent gift sagaciously seized the opportunity of adding to his popularity by forthwith issuing a decree in virtue of which the park in question is to be thrown open to the Bulgarian public during three hours of every day for all time to come.

*In examining the table it must be borne in mind that it relates only to business done in Canada. This comprises the *whole* of the business done by the local companies, but only the Canadian business of the British and American Companies. The Ætna's total income was **$4,350,897.30** in 1879.

☞ Of the $131,883 of "Policies become claims" in the case of the ÆTNA LIFE, **$53,764** was by the maturity of Endowment Policies—*i.e.*, policies payable at death or the end of 10, 15 or 20 years if living. In the other 19 companies, all combined, only a total of $24,943 of this excellent kind of insurance was paid in 1879.

$36,000 was added by the ÆTNA LIFE, the past year, to its Government Deposit, making it the largest of any Company, and nearly 4 times that of most Canadian Companies.

☞ The superior standing of the ÆTNA LIFE is shewn by its total income being **$4,350,897.30**, and by its Canada Branch income being nearly equal to the combined premium income of the whole 9 British Companies, or that of the 3 lesser American Companies, or that of all the Canadian Companies but one. This one has been 32 years getting $536,293, while the Ætna's $307,847 has grown from less than $1000 in the past 14 years.

MACHINERY OILS!

To Dealers and Consumers.

STOCK OLEVINE, Equals Castor Oil, and Warranted not to Gum.

STOCK OLEVINE Equals Castor Oil, and Warranted not to Gum.

It will give the subscriber much pleasure to forward, post free, to any address, on application, pamphlet, containing instructions and information that have been found of the greatest practical use to dealers and consumers of machinery oil in Canada. It contains the fullest information as to the different kinds of oils, their qualities and uses, thus enabling the consumer to make choice of the very oil best adapted to his wants, and also enables the merchant to select the kinds most likely to be in demand in his neighborhood. This pamphlet shows conclusively that oils properly manufactured from petroleum, are vastly superior to any *animal* or *vegetable* oil. I am now making the same qualities of "Extra" and "XX" oils I manufactured from 1870 to 1873. They are *guaranteed not to thicken with extreme cold*, and warranted to give satisfaction in every particular. Beware of Agents soliciting your orders without my trade-marked order-book. Address

PEARL YEAST CO.,

Box 1164, P. O. 39 Front Street East, Toronto

VOL. I.—NO. 5. TORONTO, ONT., DECEMBER 15, 1880. $2 PER ANNUM.

THE KEEWATIN TERRITORY.

The following interesting particulars have been furnished by Mr. John Mather, Manager of the Keewatin Lumber Company's Mills, at Keewatin, Lake of the Woods. Mr. Mather, who was for a number of years manager of Messrs. Gilmour's mills at the Gatineau, is well qualified to form a correct opinion of the country and its resources. He arrived at Ottawa recently, where he remained on business for a short time.

ITS RAPID DEVELOPMENT.

Keewatin the site of the Keewatin Lumbering and Manufacturing Company is situate at the western outlet of the Lake of the Woods, and about three miles distant from Rat Portage. It is about 125 miles east of Winnipeg, 100 miles east of Selkirk, and 300 miles west of Thunder Bay. This new village is a rival to the older settlement of Rat Portage, which has gained its principal importance, according to Mr. Mather's statement, from having been made the district headquarters of the Pacific railroad construction staff. There is a station of the Pacific railway at Keewatin, and already it has become an important shipping point. Here, Mr. Mather says, is the greatest water-power along the whole line of the Pacific Railroad in the North-west Territories. The head of water is, on the average, twenty-one feet, and the quantity which passes is possibly slightly in excess of the volume which dashes over the Chaudiere Falls at Ottawa. There are large and important water-powers in the North-west Territories, but they are all remote from the Pacific Railroad.

WHEAT FOR THE WORLD'S MARKETS.

This is the point where a large portion of the wheat grown in the North-West will be ground before shipment to the Canadian and European markets, just as American wheat is ground at Minneapolis. Already negotiations have been opened with the Hudson Bay Company for the purchase of a site and water-power at the eastern outlet of the Lake of the Woods for the erection of a large grist mill, not to carry on a mere local trade, but to grind for the world's markets, as soon as the Thunder Bay branch is open for through traffic. Keewatin has already become the centre of lumber manufacturing, and soon will obtain a more than local celebrity. The Keewatin Lumbering Company's mills have been in operation all the summer, and the Company have cut and built five large permanent trestle bridges for the Canadian Pacific Railroad. Messrs. Brandenburg & Co., who have large lumber mills at Knife Falls, on the St. Louis River, near Duluth, on the American side of the boundary line, and have entered into partnership with Mr. W. J. Macaulay, of Winnipeg, for the purpose of erecting and operating a lumber mill on the site of the old Rat Portage. The capacity of this mill, which is now in course of erection, will be five million feet per season. The capacity of the mill at Keewatin is about twenty million feet. It is rumoured that the Pacific Railway Syndicate will establish district workshops at Keewatin for the Pacific Railroad

MANUFACTURING AND MINING.

The development of the territory around the Lake of the woods promises to be very rapid as soon as through trains are running over the Thunder Bay Branch Railroad. Already the railroad construction has given an impetus to Rat Portage, where fifteen or twenty houses are being erected at the present time; and a similar number at Keewatin village, needed for the workpeople congregating around the mills. There is no agricultural land of an extent throughout the district—it resembles very much the township of Wakefield on the Gatineau River. What land there is is fertile, but the maximum extent of each patch is two or three acres. It can never sustain an agricultural population. The future of the territory depends upon its supporting a large manufacturing and mining population.

TIMBER AND RAILROAD TIES.

A few questions relative to the rumoured want of economic timber in the territory led Mr. Mather's conversation to a subject with which he is familiar. "Whoever says that the timber in the Keewatin Territory possesses no economic value," he replied, "speaks without warrant. The supply of timber will last for a period much longer than I should like to say. The red pine is much finer than any I have ever seen on the Ottawa; the white pine is similar to that on the Coulonge and Black River tributaries of the Ottawa. There is no maple or beech in the territory, but there is a large quantity of very fine cedar and tamarac, and what is called jack pine. These last three woods are all suitable for railroad ties, which will be so much required in the North-West Territories. In fact, in a few years, this will be the only district for eight hundred miles along the Pacific Railroad where ties can be obtained. This section of the road will require two million ties at first building, and an average annual supply of four hundred thousand ties for repairs thereafter. The district producing this wood suitable for ties is all tributary to the Lake of the Woods, and the timber can easily be floated to the crossing of the railroad.

ABUNDANCE OF ECONOMICAL MINERALS.

The abundance of the economic minerals found in this district has already been made the subject of considerable observation by the *Globe's* special correspondent, who recently traversed that district, and Mr. Mather had little to add on the subject. The gold excitement still continues, and discoveries of gold in quartz rock are daily recorded. Capital at the present moment is the great desideratum for the development of this industry. It is not forthcoming so far. Besides gold, silver and copper are found in large quantities. A soap stone of considerable economic value is also abundant. Large deposits of this stone are found at a place on the Lake of the Woods called Pipe Stone Point, because the Indians from Minnesota and other Western States in the past resorted here to obtain stone for making pipes. Another stone, an excellent substitute for the oil stones used by carpenters to sharpen edge tools, is abundant, and will command ready sale. Lignite, too, has been found, but generally in boulders brought from a distance by glacial action. The indications are that the true bed of lignite will be found on the Minnesota side of the boundary or water shed of the Lake of the Woods.

CONSTRUCTION OF THE RAILROAD.

A large body of men are still at work upon the Section 15, and work is being prosecuted as fast as possible.

The approach of winter has necessitated the discontinuance of work in the gravel pits, and consequently the discharge of a large body of men. The rails on the road are laid, and trains will be able to run without any difficulty till next spring. There is already one "lift" of ballast on the road from Cross Lake to Keewatin, 36 miles. On a portion of this distance the line is entirely finished, as also it is from Selkirk to Cross Lake.

ERECTION OF STEEL BRIDGES.

The Toronto Bridge Company have their foreman, Mr. Dansizer at the Lake of the Woods waiting to superintend the erection of two steel bridges across the two outlets of the lake. It was, by some unaccountable means, delayed in Duluth for six weeks. The masonry has already been built, and is waiting for the superstructure.

SALE OF FORT FRANCES STORES.

Recently the Government stores at Fort Frances Lock were taken to Keewatin and sold by auction. The steamer Lady of the Lakes, used on the works, was also sold, and purchased by Mr. W. J. Macaulay, lumberman, for $1,500; she originally cost considerably over one hundred thousand dollars, and was purchased by the Macdonald-Cartier Govarnment to ply in connection with the Dawson route. She has, since the sale, met with an accident, but will be at work again next summer, towing logs, &c. The Keewatin Lumbering Company have also built a small steamer for similar purposes.

THE BOUNDARY DISPUTE.

Much inconvenience is caused to settlers in this district by the non settlement of the boundary question; and they are as much isolated from the exercise of their civil rights and the protection of the law as if they were residing in the heart of the "Dark" Continent. There is no Court where a man can sue or be sued, or where he can collect a debt or seek restitution for losses sustained. The only persons who obtain the benefits of the law are the whiskey smugglers, who, if captured, are introduced to the Stipendiary Magistrate appointed under the Act for the better preservation of order in the vicinity of public works. No school system can be established until this unfortunate dispute has been settled. The education of the children—and there are many in the settlement—is provided by private co-operation. The Keewatin Lumbering Company are about erecting a schoolhouse at Keewatin for the convenience of their employees' children. There is no system, and there can be none until the matter is definitely settled.

"WET GROCERIES," WHICH PAY NO DUTY.

An enterprising Yankee has cut a road through the bush from Hallock's Station on the St. Paul and Manitoba Railroad, to a point near the boundary line at the Lake of the Woods. At this place he has established a store or "whiskey shanty," where all kinds of "wet groceries" are dispensed to visitors from Rat Portage, in Canada. All kinds of goods are smuggled into Canada from this man's shanty, and a considerable loss inflicted upon the revenue of the Dominion. During the past season he is said to have carted along this road, from Hallock's to his store, over eighty-thousand dollars worth of goods. An effort should be made to stop this illicit traffic.

A WET SEASON.

In this district, as throughout the North-West Territories, the season has been an unusually wet one. The earliest settler does not remember the like.

AN UNFAVOURABLE VIEW OF MINNESOTA.

Mr. Mather, adverting to the absurd stories published of the floods in Manitoba and the swampy character of the country, characterised them as much exaggerated. "Why," he said, "about Dominion day last I had occasion to go from Winnipeg to Minneapolis. On leaving Manitoba the weather was fine, and the whole country along the railroad high and dry. The crops could be everywhere seen growing and thriving. But a considerable distance along the St. Paul and Manitoba Railroad in Minnesota I noticed that long stretches of country were covered completely over with water as if there were lakes there. The wheat was completely under water, and all farm field work suspended. This was the very territory a few months previous I had admired, because it was so dry and high."

A MESMERIC EXPERIMENT.

Thirty Christmas nights have come and gone since that one, so memorable in my life, and yet sitting here in my solitary room, a gray-haired, lonely woman, the whole scene rises as vividly before me as though it had occurred but yesterday. I can see the comfortably but plainly furnished, low-ceiled, old-fashioned room, with its dark wainscoted walls, and its dim corners, that the feeble light of a couple of composite candles could scarcely reach; I can see the half circle of faces gathered round the hearth, looking glowing and pleasant in the ruddy glare of the firelight—all except one, that of a man who sat in the corner opposite to me.

I could not keep my eyes off that face, which had for me the fascination of ugliness; as the lights and shadows made by the flickering flame touched the shock of bristly hair that half concealed the low, narrow forehead, the cavernous eyes, sunken cheeks, and huge mouth, half open with a cynical smile, that showed the tusk-like teeth, I could compare it only with a shifting series of gargoyles from some old monkish ruin.

We were all members of the company of the theatre Royal X——, and, it being a non-play night, we were assembled at the lodgings of one of our members, a lady, to do honour to her birthday. Our usual theme, the affairs of the theatre, past, present, and future, being exhausted, the conversation, I can not remember how, had turned upon mesmerism and clairvoyance, and I was stoutly declaring my utter disbelief in either, my scepticism being greatly intensified by the circumstance that Tony Arnold—the man I have just described, and who was one of the low comedians of our company—took the opposite side. There had always been an antagonism between us, and, although I had no actual cause for such a feeling, a positive dislike upon my part, which I believe was pretty strongly reciprocated upon his.

Although I was scarcely 29 at the time, I was what people would have called rather a strong minded girl, with opinions of my own that I never shrank from asserting, with an obstinacy that no argument could overcome; and on this night, excited by a spirit of defiance to my vis-a-vis, I expressed them with a bigotry and contempt that were anything but polite to those who differed with me.

"By your positiveness, Miss Gr——s," sneered Arnold, "I presume you have had a very large experience of the trickeries of mesmerists."

"Oh, indeed I have not," I replied sharply, "I was never at any exhibition of the kind in my life, and never intend to be. I should not have patience even to witness such a transparent imposture."

"Suppose," he said, and there was a gleam in his eyes which indicated rising temper, "suppose I could give you ocular demonstration that you are wrong, by placing some one in this room under mesmeric influence; I have done the thing often. If I did this before your own eyes, when you would be quite assured there could not be trick or collusion, would you believe it then?"

"I don't know that I should," I answered doggedly. "If you have such a power," I added with a contemptuous smile, why don't you try it upon me?"

Arnold was evidently taken aback. I do not think he dreamed of my taking up his challenge. He regarded me some seconds with a doubtful, wavering glance, which I met defiantly and mockingly.

"I would prefer any one else in the room, he answered hesitatingly.

"Of course you would," I replied with a malicious laugh. "I am not a good subject; the mystic influence is powerless over disbelievers. Oh, I know all the jargon!"

And I cast a triumphant glance round the company, who were exceedingly amused at our discussion.

Arnold turned alternately white and red with rage and mortification.

"It is not that," he answered quickly, then paused, but, evidently stung by my contemptuous laugh, he added instantly:—"Very well, be it so, since you desire it."

The prospect of having the discussion so summarily tested and adjudged created an intense excitement, and I could feel my own cheeks burning and my pulse galloping at fever heat as Arnold proceeded to make preparations for the experiment.

I anticipated the usual passes and hand wavings of which I had read, but I soon perceived that his method was going to be entirely different. He began by placing two chairs exactly opposite to one another, in one of which he requested me to be seated; then he draped a large black cloak around me, so that only my face rose above it; then a lamp, borrowed from the landlady of the house, was set in such a position that the light should focus upon my face, after which he took the chair opposite to mine and desired me to fix my eyes firmly upon his, and not remove them for a second.

I followed his instructions, and the next moment I was staring intently into a pair of greenish-brown orbs that I could feel did not meet mine with equal steadiness. There was profound silence, broken only by a little suppressed giggle from the females, and an occasional low whisper from the men.

We had been thus only a few seconds when Arnold sprang up, exclaiming: "Its no use, I can not do it."

A shout of laughter hailed this confession of defeat, and, throwing off my drapery, I jumped up and joined heartily in the chorus.

Arnold was white as death, and extremely agitated. He made no reply to the volley of "chaff" that assailed him on all sides, but again turning to me, said in a tone of intense earnestness: "I can not mesmerize you, but you can me; those strong, steel gray eyes of yours, with their metallic lustre, are far more potent than mine. Come, will you try?"

I did not need the incitement of hand-clapping and the chorus of 'Oh, do!' that greeted the proposition, to promptly consent. I began to be deeply interested in the experiment, and now that I was myself accredited with possessing this occult power, my scepticism began to waver.

"But before we go any further," he said, "I must make one condition—and that is, that should I fall into a comatose state, you will not put to me any question of a private nature—as I shall be compelled to answer truthfully, literally, whatever it may be."

I promised faithfully not to do so,

The previous disposition was now reversed, the lamp was set so that the light should shine upon my face, and Arnold was enveloped in a cloak, as I had been.

And now, with all the nerve power I possessed, I fastened my eyes upon Arnold's. White and ghastly looked his face rising out of the blackness of the drapery, which gave it almost the appearance of being divided from the body and suspended in space. The lips were wide apart, and the greenish eyes were dilated to their utmost extent, with a strained fascinated look, such as they might have worn under the influence of a rattle-snake. I could scarcely suppress a shiver at this uncanny-looking picture; but a wild spirit took possession of me that night which soon swept away all such "compunctious visitings of nature." Everybody seemed to be thoroughly impressed by the weirdness of the situation; there was no giggling, no whispering, all was silent as death. After about a minute my eyes grew rigid in their intense stare, until it seemed to me that I no longer had the power to move or close them, or even wink a lid; gradually I could feel the pupils dilate, until they seemed to become two huge discs glowing with a lambent and metallic fire. I could see that every nerve of the white face was quivering, the breathing was short and labored, and a dull, stony glare came into the starting eyeballs, a far-away, trance-like look, that told me consciousness was gone, and that the very soul of the man had passed over to my keeping. And I felt a cold, cruel, hard triumph in this, a desire to strain mastery to the utmost. I rose from my seat, slowly moved backward, and imperiously beckoned him, never relaxing my fixed stare, which seemed to scintilate and flash. As I rose, he rose, clutching the edge of the table to guide his trembling steps. Slowly I moved, he following, seemingly impelled by an involuntary but resistless impulse. I stopped suddenly; he stopped.

"What is your name?" I asked imperatively.

In a forced, hollow voice he gave one that I afterward discovered was his family name, Arnold being only a theatrical sobriquet.

At this one of the gentlemen broke in, protesting:

'No, no; that is againgt the bargain—no questions."

"It is time to put an end to it; I don't like it," said another.

"Oh! yes," added a lady, 'too horrible."

The interruption seemed to exercise the fiend that possessed me, and call me back to myself; with an effort I wrenched my gaze from that ghastly face. As I did so, Arnold, as though he had been only upheld by my eyes, fell upon the floor in strong convulsions.

Our experiment in mesmerism spoiled the rest of the evening; for although after a copious outward application of cold water, and a judicious inward one of neat brandy he soon recovered and tried to laugh off his illness, it left a creepy, disagreeable depression upon all, which no amount of hot spirits and water and forced jollity could succeed in dispelling.

As it may be supposed, the effect was strongest upon me, and it chiefly took the form of intense annoyance at the part I had played; I would have given anything to have realized the past few minutes. After Arnold's recovery, by a tacit understanding, no one made any reference to his strange illness, indeed all seemed desirous for a time of putting it out of their thoughts—and none so much as the principal actor in it, who laughed and jested in a feverish manner and never allowed the conversation to flag for a single moment, as though he feared the subject might crop out again.

Everybody, however, was eagerly discussing the singular event the next morning at rehearsal. I avoided the gossiping groups, for the remembrance of the scene was a horror to me; so did Arnold, whom I studiously attempted to avoid, but he took an exact opposite course, followed me wherever I went, trying to engage me in conversation and to catch my eye, as though some of the fascination of the previous night still surrounded me.

After a rather late dinner, for the rehearsal was very long, I was dozing in my chair when there came a soft tap at the door, and to my sleepy 'come in' there appeared upon the threshold the tall, gaunt figure of the man whom of all others I last desired to see. It gave me quite a shock. It was the first time he had ever called at my lodgings.

In common courtesy I was obliged to ask him to take a seat and draw near the fire, as the weather was cold. In a vague, listless manner he placed a chair in such a position that it exactly faced mine, dropped into it without a word, and tried to fix my eyes. I immediately shifted them and gazed into the fire.

He made no attempt to account for this visit; he talked very little, and in an absent manner—that betrayed that his thoughts were not on his tongue—about the business of the theatre. I felt very embarrassed by his presence, and presently rose and rang for tea. What could I do but ask him to remain and take it with me? He said 'thank you,' and kept his seat. I felt quite terrified by the change that had come over him—from a noisy, jesting, rollicking kind of fellow, who had always a jibe for me, to this silent, subdued man, with those dreadful eyes ever yearningly seeking mine.

At length he went away, and never in my life did I feel so thankful for anybody's departure.

But he came the next day about the same time, and acted in just the same manner, until the lights were brought in; then all at once he rose from his chair, crossed over to where I was sitting, and, laying his hand upon my arm, said, in a hoarse whisper: 'Mesmerize me!'

I started back and answered, shudderingly: "Not for worlds!"

"You must," he answered passionately.

And somehow or other, I cannot tell how, a few minutes afterward we were sitting *vis-a-vis* staring into each other's eyes. In less than a minute there was in his face the dull stony vagueness of insensibility.

I covered my face with my hands, but withdrew them, as I heard something fall heavily upon the floor, to see him huddled at my feet in convulsions, and froth bubbling upon his lips.

When he recovered I nearly fainted myself; but rallying by an effort, I told him very positively that he must not come any more.

"I cannot stay away; I must come," was his answer. And again the dilated eyes began to wander cravingly in search of mine.

I cannot describe the horror I felt at these visits, and at length I begged a lady friend I had in the theatre to come and stay with me. The following afternoon he strolled in as usual, but finding I had a companion he looked very annoyed, and remained only a few minutes.

Several days passed, and I met him only in business. His manner was sullen, almost rude to me, at which I was much relieved, for I now began to entertain hopes that he would persecute me no more. The change that had come over him was a constant subject of green-room comment; he had always been extremely thin, now he seemed to waste day by day, like a man consumed by an inward fire; his cheeks were sunk in deeper hollows, and there were black rings around his eyes.

After a few days my friend returned to her own lodgings. The next afternoon, at the usual hour, Arnold came as before.

As soon as the lights were brought in he again besought me to mesmerize him. I firmly refused; but I could not rest my eyes upon him for a moment without his face beginning to quiver and his pupils to dilate, and the very feeling that I must now look at him made the desire almost unconquerable. Matters went on thus for upward of a week.

But surely, it will be said, you could have devised some means of keeping him away; you might have requested your landlady to refuse him admittance. Truly, I could have done so, but—well, I must confess it even in my own defense—Arnold had begun to throw a strange glamour over me. I dreaded his coming, yet I experienced a vague yearning when he was absent. I had fallen myself within the meshes of the spell I had unconsciously cast upon him.

One afternoon he arrived rather earlier than usual; there was certainly some occult sympathy between us, for the moment he entered the room I felt that a crisis was come.

He was in very weak health, and he sank down in a chair looking pale and exhausted, and wiped the damps from his forehead, while his breathing was very labored; and there was a feverish glitter in the restless eyes and a red spot in each hollow cheek.

"How very ill you look," I said pityingly; "let me give you a glass of wine."

"No, I want nothing," he said in a gasping tone, "there's quite a fire burning within me now; I am being slowly burned up."

"Have you seen a doctor?" I asked, growing very nervous.

"A doctor," he echoed with a mocking laugh. "Oh, yes, I have seen a doctor, but he can do me no good. It is you who are killing me."

"I!" I answered faintly.

"Yes," he answered; "since the night you tore the heart and soul out of my body I cannot live without you, and I won't."

I was very much terrified by his wild, excited looks, but replied with a great show of firmness: "You talk nonsense, Arnold; why, you are married already."

I did not know at the moment whether it was really so, but there was a vague impression among the company that such was the case, and it was upon that authority only that I spoke.

"How did you know that—you questioned me when I was under your influence?" he retorted sharply.

"I did not, but I find it is true. And under such circumstances, how dare you address me in such terms?" I exclaimed, growing very indignant, perhaps more in seeming than in reality.

"Yes," he replied, dejectedly, "I am married to a woman I hate; to a woman I left at the church door. I was forced into it by my friends—never mind why; that would not interest you."

He paused for a moment, then laying his trembling fingers upon my arm, he added: "Alice," he had come to call me by my Christian name, "if anything were to happen to he.—if she were to die—would you be my wife?"

I started away from him, exclaiming: "Don't talk like that, it is too horrible!"

But he followed, and again grasped my arm, and said: "Alice, I told you just now that I cannot live without you, and that I will not, and I swear before God that if you do not give me this promise, when I leave this house I will throw myself over the bridge, into the river—I swear it!"

Men—and women, too,—say these things in moments of strong passion without keeping their words; but I knew that he would keep his, the mysterious sympathy that had been created between us told me so, told me that if he left me with that thought in his heart, he would not be a living man within the next hour.

It was nearly dark, just between the lights, and his face gleamed out of the shadows white and terrible, and then I thought how it would look when it was drawn out of the water with the long dark hair clinging about it.

"It is not too much to ask of you," he went on, pleadingly. "Why, she may outlive us both; more than likely; there is nothing shocking in it—she is nothing to me, never has been, only the mockery of a ceremony links us."

"But what is the use of a pledge, what

satisfaction can it be to you?" I said, still with my face covered, for I dreaded to meet his eyes.

"I don't know," he answered; "It would give a sort of hope that I can't live without, that I won't live without."

"Well, I gave him the promise. I dare say you will consider it was very wicked of me to do so. I think so myself. But I thought it was almost impossible that I should be ever called upon to fulfil it, and how could I hesitate when a man's life seemed at stake?

The following morning, as I was seated at breakfast, I caught sight of Arnold's dark figure passing my parlor window, and the next moment I heard his now well-known knock at the street door. I put down the cup of coffee that I had raised half way to my lips, while an unaccountable dread stole over me.

One glance at his countenance as he entered the room told me that something had happened. He did not look at me, not even exchange a greeting, as he laid down his hat and took a chair.

"I have strange news to tell you, Alice," he said in a voice thick and indistinct with agitation.

"For God's sake don't tell me that—"

I could not complete the utterance of my fears, my voice died away in my throat, and with parted lips and rigid eyes I could only await the explanation.

Meantime he had taken from his breast-pocket a letter, which he rose and offered me. It had a deep black border.

I shrank back; I would not touch it; I knew its contents.

"You knew what was going to happen—you have cruelly entrapped me," I exclaimed bitterly.

He threw himself upon his knees at my feet. "I did not. It was very sudden, the letter will tell you so; heart disease—her friends had scarcely a moment's warning."

There was that in his tone I could not disbelieve, and when, after a while, I brought myself to read the fatal letter, I found his assertions were there fully confirmed.

"This makes it all the more horrible," I cried, "for I now feel as though I were in some way the cause of her death."

"I implored him to release me from my promise, as nothing could come of a marriage contracted under such auspices. But he only repeated the old words: I cannot live without you, and I won't!"

"My friend who could perceive how ill-assorted were, did all in her power to persuade me to break with him. 'Leave the company,' she said, 'give no notice of your intention, and go home, or take another engagement under another name.'

"But I felt that I could not break a vow so solemnly made, and which fate, whether for good or evil, had so suddenly called upon me to fulfil.

"No, I am wrong; I did not love him, it was only a glamor—whether the result of supernatural influence or mere superstition I cannot pretend to say—it was a mixture of dread, repulsion, and fascination.

"That day two months was our wedding-day. I had strive hard to postpone it to a much later date, but he would not give me a moment's peace until I consented. 'She was only my wife in name,' he kept urging, 'so what need is there of delay?'

"Although the strange manner of our wooing was unknown to everybody save the friend I have before mentioned, it was impossible for the company not to see how matters stood between us. But somehow we had drifted away from the rest, and now kept aloof from them, and only an occasional hint, or innuendo, or sly look told us of their observation. I know we were the constant theme of conversation and wonderment, but I do not think any one ever dreamed it would be a match.

"And we were both equally desirous of keeping our approaching marriage a profound secret. My friend, and one of the actors whom Arnold had a most sworn to secrecy, were to be the only witnesses, so that when on that bright March morning we entered the quiet suburban church, only a few strange loiterers were there. We were dressed in our ordinary costume, and no one who had met us would have suspected our purpose.

"When he passed the ring over my finger his hand was like ice, so were his lips that just touched mine at the end of the ceremony, and I saw no joy in the livid face, that was expressionless as though carved in stone.

"We walked back from the church to my lodgings, where we were to be domiciled for the present. He scarcely spoke the whole way. He left me at the door, saying that he was obliged to go somewhere, but that he would return in time for dinner, which was arranged for three o'clock.

"I ran upstairs to my bedroom, my heart ready to burst with mortification, and had a good cry. My friend did all she could to console me and to put a cheerful face upon matters, and after a while I rallied a little, and went downstairs and sat down to the piano, and played and sang to pass away the time.

"Three o'clock came and passed, and still he did not return. Then his friend, who had remained with us, said he would go in search of him.

"In about half an hour he came back, bringing Arnold with him. He afterward told me that he had found him playing cards, and recklessly treating everybody who entered the room at a tavern used by the actors. I always possessed a great deal of self-control, and I kept myself quite tranquil.

"It had been arranged that we should sup at my friend's lodgings, and thither, after the performance, for we played that night, we went. There were only four us—the four present at the ceremony. Arnold was dull and sullen, and at times seemed scarcely conscious of where he was, for, when addressed, he would start and look vacantly about him, like one suddenly aroused from a doze.

"It was two o'clock in the morning before we turned our faces homeward. Silently he pursued his way; and I was too proud to speak. But, oh, the agony, the shame, the humiliation I endured that night! When we arrived at our lodgings the fire was out. It was a very chilly night, and he complained of being cold, and said he should rekindle it. While he went away seeking some wood in the kitchen I ran away up stairs to my room and went to bed.

"At last my aching, swollen eyes closed, and I fell asleep.

"When I awoke the cold gray dawn of the spring morning was just stealing across the darkness of my room. I awoke with a start, and sat bolt upright, with a sense of ineffable horror. Had I been dreaming? I could not remember. Yet there was upon me all the terror which is left by some ghastly nightmare.

"I leaped out of bed, huddled on a dressing-gown, and with bare feet hurried down the stairs. It was impulse, nothing more, for I had no thought in what I was doing. I opened the parlor door and looked in. All was dark and silent.

"'He has gone to sleep upon the sofa,' was my reflection. My woman's pride prompted me to return to my chamber, but some other feeling held me rooted to the spot. The chinks of the shutters were pencilled with faint lines of light. I crossed the room, unbarred and threw them open, and looked up at the sky. The waning moon was high in the heavens, over which a faint roseate flush was just stealing, and a wild chorus of birds in the trees close by alone broke the deep stillness of the early morning.

"I stood gazing upon the picture for some seconds not because I felt its beauty, but because I dared not, turn my head.

"When, after a time, I summoned up resolution to do so, it was slowly and by degrees. First my fell upon the sofa; that was empty; then they traveled toward the hearth. The fire had burned into a great hollow, gray and brown within, black above. I could see only a portion of the grate, as an easy-chair was drawn in front of it. There was something in the chair, something lolling sideways; and there was a coat-sleeve with a hand dangling across one arm. I could feel my hair bristle and my heart stand still as I crept up to it, and saw a huddled heap of clothing, in which was half buried a livid, hair-strewn face.

"It was my husband—dead."

NOTE.—This story is not only founded upon facts, but the events happened almost exactly as they are related here.—*Temple Bar.*

As John Miller, toll gate keeper in Adams county, Pa., went out to collect toll of an old man who was passing through the gate, a bystander remarked that the two men looked enough alike to be twins. Investigation proved that they were twin brothers born in 1816 who had not seen each other for sixty years. When they were four years of age their mother, a poor woman, sent them into separate counties to live among friends. This was the last they saw of each other until this adventure. Daniel Miller had lived within twenty miles of his brother, but had no knowledge of the latters' existence.

How Long will the Sun Last?

PROFESSOR C. A. YOUNG GIVES HIS VIEWS ON THE FUTURE OF THE UNIVERSE.

(From the Popular Science Monthly).

How is the heat of the sun maintained? How long as it lasted already? How long will it continue? After affirming that, in the present state of science, only somewhat vague and unsatisfactory replies are possible, Prof. Young holds that, so far as observation goes, we can only say that the outpouring of the solar heat, amazing as it is, appears to have gone on unchanged through all the centuries of human history. The author thinks that there is some truth in each of the two theories which have been proposed to account for the sun's fire.

As to the first, the impact of meteoric matter, it is quite certain that solar heat is thus produced; but the question is whether the supply of meteoric matter is sufficient to account for any great proportion of the whole. After giving Sir William Thompson's calculation of the amount of heat which would be produced by each of the planets falling into the sun from its present orbit, by which it appears that Jupiter would maintain the sun's present expenditure of energy for 32 - 254 years, and Mercury for six years and 219 days, and that the collapse of all the planets upon the sun would generate sufficient heat to maintain its supply for nearly 46,000 years; and after estimating that matter equal to only about one-hundreth part of the mass of the earth, falling annually upon the solar surface, would maintain its radiation indefinitely, Prof. Young thinks it improbable, from astronomical reasons, that any such quantity of matter can be supposed to reach the sun. So large a quantity of matter would necessitate a vastly greater quantity circulating around the sun, between it and the planet Mercury. But if there were near the sun meteoric matter equalling, for example, the mass of the earth, it ought to produce an observable effect on the motions of Mercury, and no such effect has yet been detected.

Astronomers, therefore, failing to find a full explanation of the cause of solar energy in this hypothesis, have adopted a second one, which is, that the sun's diameter is slowly contracting, and that the gaseous mass is gradually condensing and becoming solid. The conclusion is drawn that, if this theory be correct, there must come a time when there will be no solar heat, as there has also been a time when it began. How far forward is the end, how far backward the beginning? Newcomb is authority for the statement that, with its present radiation, the sun will shrink to half its present diameter in about five million years. Reduced to this size, and eight times as dense as now, it would cease to be mainly gaseous, and its temperature would begin to fall. Hence Newcomb assigns as the term during which the sun can supply heat enough to support life on the earth, as we know life, a period of ten million years.

The writer somewhat more confidently casts his eye backward, and concludes that the sun cannot have been emitting heat at the present rate for more than eighteen million years if its heat has been generated in the manner described. If the sun has contracted from a diameter even many times larger that that of Neptune's orbit, to its present dimensions, as if probably true in the main, "we are inexorably shut up to the conclusion that the total life of the solar system, from its birth to its death, is included in some such space of time as thirty millions of years; no reasonable allowance for the fall of meteoric matter," &c., "could raise it to sixty millions." The possibility of collision with wandering stars, and the suggestion of ways as yet unconceived of for restoring wasted energy, are followed by the statement that "the present order of things appears to be limited in either direction by terminal catastrophes which are veiled in clouds as yet impenetrable."

A STRANGE kitten was given a home, on the steamship Illinois, which was then in her dock in Philadelphia. When the steamer left Liverpool recently for home, it was found that the kitten had been left behind. The captain and sailors were much grieved, because they never expected to see her again. When the British Crown, the next steamer of the American line to sail from Liverpool, arrived in Philadelphia, the first passenger to creep ashore was pussy. With tail and mane erected she flew on board the Illinois, and began to race about the decks, showing in every way her dumb nature would allow the joy that was in her heart at getting back to her old home.

PERSONAL.

MR. HUGHES says that Dean Stanley was the original of Tom Brown.

SIR EDWARD THORNTON and his family return to Washington this month.

MR. MILLAIS returns his income to the Commissioner at seven thousand pounds.

THE Dean of Windsor is the confidential adviser of the Queen in all matters belonging to Church patronage.

GEROME, the artist, is now not far from sixty years old, and is said to be one of the handsomest men in France.

LORD HOUGHTON'S tenants lately presented to his new daughter-in-law, Mrs. Milnes, a fine bracelet of pearls, diamonds, and rubies as a wedding gift.

THE Empress Eugenie telegraphed to a gentleman on the staff of *Figaro* who recently lost his daughter, a message begging leave to associate herself with his grief.

JOHN BRIGHT, despite all of his Quaker antecedents, was beheld a fortnight ago moved to tears by Modjeska's impersonation of Mary Stuart at the Court theatre, London.

THE marriage of Prince William of Prussia will take place in Berlin on the 26th of February. The prince and princess of Wales will represent Queen Victoria on the occasion.

MRS. CHARLES CROCKETT, the wife of the president of the Southern Pacific Railway, has expended three thousand dollars in bringing the young actress Miss Calhoun before the public.

MR. TENNYSON has spent the autumn at his place on the Hampshire Downs, but he passes the coming winter in London, and does not leave for the Isle of Wight until summer.

BISHOP COLENSO is a man nearly seven feet tall, and of a massive frame. He is sixty-six years old, and is regarded by the natives with awe and reverence, and they salute him as a great chief.

MR. GLADSTONE having been asked, some little time ago, if he did not consider Tennyson the greatest genius of the age, replied in the negative, and added that without a doubt Disraeli merited that title.

IN spite of the fact that Prince Edward of Saxe Weimar is a German, and so not properly in command at all in the British army, he is idolized throughout his military district, and the object of universal respect in the army.

THE widower of the Princess Alice, the Grand Duke of Hesse-Darmstadt, is described as looking every inch a prince; he is tall and ruddy, has a pleasant and intelligent expression, with keen eyes, and a frank and courtly manner.

PRINCE JEROME BONAPARTE is a remarkably fine talker, but when he wearies of his interlocutor he stands erect directly before him, and yawns in the middle of one of his sentences—which answers for Bonapartes, if not for princes.

WHEN the Crown Prince visited Nuremberg, the burghers presented him with a costly album, and at the same time declared their loyalty to be as firm as the walls of their city—the walls, however, are presently to be entirely demolished.

THE Sultan seems to have more diamonds than ducats. A cigarette that he offered some one at a supper which he gave being declined, he produced a snuff box set with superb brilliants, and bade the person use that instead, and keep it.

CARVED on an old stone in a little Maryland grave-yard, after the name of the dead and the customary formula, may be read the words, "He held the pall at the funeral of Shakspeare." The late Fred Loring wrote some fine verses on the discovery.

OLIVE LOGAN has a friend who lived in Cuba, and used to observe some grand ladies driving out every afternoon with flowers in their hair, diamonds on their necks, and the volante full of the flounces of their gay silks. One day the carriage upset and spilled out the high-mightinesses, and it was seen that they had on neither shoes nor stockings.

ONE of the London papers recently remarked that Lord Dufferin's life at St. Petersburg was made insupportable by his ignorance of French. The fact is, however, that Lord Dufferin is one of the most accomplished French linguists living, and presiding once at a banquet to the Comedie Francaise, was eulogized by M. Got on the fluency and felicity of his French.

Chaudiere Mills.

Those establishments are chiefly engaged in the export trade. They are in full work usually about six months of the year, viz: from the 15th of May to the 15th of November. In this number of the LUMBERMAN we have only room to give a short description of the following :—

PERLEY AND PATTEE'S MILLS.

The firm of Perley and Pattee was established in the year 1857, and has very extensive mills at the head of the Chaudiere Falls, with large piling grounds, through a portion of which are laid lines of rails for distributing the piling and shipping the timber.

They get out annually, from 150,000 to 250,000 Standards logs, producing from 30 to 50 million feet of pine lumber, of which a considerable amount is kept always on hand. They employ a large number of men through the year; on an average about 1000, and 250 teams of horses.

Their mills are furnished with two slabbing gangs of twenty saws each; two stock gangs of forty saws each; two Yankee gates of thirty-two saws each; one single gate and one re-sawing gang, with the usual compliment of circular saws for butting and edging. The wheels employed, are Rose's improved, and the Lamb wheel; one pair to each gate.

J. R. BOOTH.

This gentleman first established business at the Chaudiere in the year 1858, by the manufacture of laths, and now carries on extensive operations in sawing pine lumber. His mills are situated on the south shore of the Ottawa, just below the falls, and manufacture annually from 26 to 30 million feet of pine lumber, of which 12 to 15 million feet are always on hand on his piling grounds, which cover a space of about 10 acres of land.

These mills are fitted with gang and circular saws as follows ;—

Three gangs containing 40 saws; 3 slabber gangs, containing from 18 to 20 saws; 1 Yankee gate containing 36 saws; 1 large circular saw for dimension timber; and a large number of circular saws for butting and edging.

The power employed is derived from the waters of the Chaudiere, assisted by 14 Rose's improved waterwheels, 2 for each gate, and upright and central discharge wheels.

This establishment gives employment, in the winter time, in the woods, to about 850 men and 300 teams, and in the summer time, at the mills, to 400 men, and 40 teams.

Mr. Booth gets out 3 or 4 rafts of square timber in the season.

LEVI YOUNG.

First established his business at the Chaudiere in 1854, and owns one saw mill, getting out and sawing about 100 000 in the year, producing about 20,000,000 feet of pine timber. He employs one slabbing gate of 40 saws; one stock gate of 40 saws; one Yankee gate of 32 saws, and the necessary edging and butting saws. The wheels employed are Rose's improved, 1 pair to each gate. In addition to this, Captain Young gets out annually about 3 rafts of square timber, employing through the year from four to five hundred men.

BRONSONS & WESTON.

This firm was established in 1853, and was the first to take up land at the Chaudiere for the purpose of establishing a saw-mill on a large scale.

They are now proprietors of two large saw-mills, and a grist-mill, lath and splitting mills, and own a large tract of land used as a piling ground—the whole premises extending from near the wooden bridge to the point of the island. They get out annually about 100,000 logs, producing between 30 and 40 feet of lumber, of which from 5 to 10 million feet are always kept on hand,

The large mill contains 2 stock gangs, of 30 to 40 saws; 2 slabber gangs, 14 to 16 saws; 2 Yankee gates, 32 saws; 1 single saw; with the necessary butting and edging saws, The smaller mill contains 1 slabber eght, 1 stock gate, and butting and edging saws.

The wheels employed are Rose's improved and the Lamb wheel.

The lath mill contains two gangs for sawing laths, 5 or 6 saws each; a butting apparatus and picket saw; and a splitting mill for slabs; and produces 10 millions of laths.

They employ for six months of the year, in shipping the productions of these mills, 26 barges with 5 men each, 4 steamboats, 9 men each, in all 222 men.

It requires $3,000 to pay the weekly wages of the employees of this establishment.

THE BUCKINGHAM MILLS.

These mills are situated on the River Du Lievre, about four miles back from the Ottawa, and in conjunction with the mills belonging to Messrs. Jas Maclaren & Co., on the opposite side of the river, have control of one of the finest water powers in Canada; the falls are 70 feet in height, and the river Lievre being very deep and supplied by many large lakes in the north, there never is any scarcity of water, even in the driest summers.

The mills having recently been rebuilt, are of large size, and fitted with every modern improvement, to save labour and to do good sawing. The business done is about 800,000 logs a year, which are sawn almost entirely into 3-inch deals for the Quebec market. A slide over two miles in length conveys the timber from the mills to the Basin, where the thin lumber is taken out and piled, and the deals are run into the water and rafted up into cribs.

All the logs sawed at these mills are made on the tributaries of the River du Lievre which drains an immense extent of country. The two firms that work on this river have, at their own expense, built very extensive slides to pass their logs over different falls, and also constructed many booms, piers, &c., at different points, the Government never having expended anything on the River du Lievre for improvements of any kind, though the public have for very many years derived a large revenue from it.

New Brunswick.

NEW SAW-MILL.

Our Chatham (N. B.) correspondent writes :—The Hon. Mr. Muirhead has commenced to build a two gang mill, on the site of the three gang one burned last spring The new mill, it is said, if not superior, will be equal to the best in the Province. The people generally hail with delight this enterprise of the Senator, and hope it will prove a financial success to him, and trust that it will be equally as beneficial to Chatham as the burned one was under his management and that of his predecessors.

ST. JOHN LUMBER EXPORTS.

The lumber exports across the Atlantic from St. John, N. B., from January 1st to October 31st are shown by the following table, with the names of shippers, and the amount shipped by each :

	Deals and ends Feet.	Timber. Pine. Tons.	Birch. Tons.
Alex. Gibson	70 433,000	20	5,252
R A & J Stewart	39 351 000	855	2,060
Guy, Bevan & Co	29 198,000	....	.....
Carville, McK. & Co.	29,990,000	291	893
W M McKay	12,322,000	1,174	3 831
S Schofield	6 191,000	31	242
McLachlan & Wilson	547,000	3	2 899
Total	186 032,000	2,374	15,177

MIRAMICHI LUMBER SHIPMENTS.

The Miramichi *Advance* publishes a table which shows the quantity of lumber shipped from Miramichi during the season just closed, by each of the shippers. The number and tonnage of the ships are as follows :

SHIPPERS.	VESSELS.	TONS.
R. A. & J. Stewart	74	38 884
J. B. Snowball	74	38 104
Guy Bevan & Co	66	33 747
W. Muirhead	32	16 816
D. & J. Ritchie & Co	32	14 527
A. Morrison	27	12 619
Geo. McLeod	21	10 635
Gilmour, Rankin & Co	11	7 298
Geo. Burchill	12	6 522
C. F. Todd	1	617
	350	179 799

The total shipment of deals is 154,694,312 superficial feet for the season, and it exceeds the shipment of 1877—the big lumber year on the Miramichi. The figures for that year were 149 938.593 s. f. deals; 5,409 166 pieces paling, and 1827 tons timber. The quantities shipped each year since 1877 stand as follows :

	S F DEALS.	PS PAL.	TONS TIM.
1877	149 338 563	5 409 166	1827
1878	104 729 702	3 055 071	66
1879	114 618 000	2 784 500	500
1880	154 694 312	4 651 703	3225

Mr. Snowball shipped ten tons juniper this year in addition to the woods stated above.

The quantity of logs and deals left on the Miramichi this season is much smaller than for many years. But for the fact that the 30,000,000 drive of logs which has hung up so long, has nearly all reached the boom, the manufactured stock left over this season would have only been a few thousands. Seven mills were sawing yesterday but they will have to cease in a day or two. Late as the delayed logs were in coming down, several millions of feet have been converted into deals from them and shipped, and the present sawing will enable some of our shippers to have a few cargoes on hand for early delivery. The trade here appears to think that the market in Great Britain is not in the most promising condition, and operations for the next year's business, therefore, should be cautiously undertaken

APPROXIMATE ESTIMATES FOR 1880 81.

A correspondent of the *Monetary Times* writing from St. John, N. B., says :—The estimate made here by some well-informed persons is that probably 400,000 000 superficial feet may be got out in New Brunswick this season. This is only an approximation; but as the exports of this province for the this season now closed say 387,000 000 lineal feet, it is not likely to be far astray. These 400,000 feet will likely be apportioned somewhat as follows ;—

The Miramichi	120,000 000	feet.
Other North Shore ports	15 000,000	"
The St. John	220,000 000	"
Other places	45,000 000	"
Total	400,000,000	feet.

To these "guesses" I may add some facts, viz: that the shipments this year from Newcastle, made in 129 vessels of 68,626 tons, were 54,808 000 feet of deals and ends as against only 15,809 000 last year. The shipments of scantlings, battens, boards and palings, were more than doubled. Of square timber, 616 tons birch and 143 tons pine were shipped, as compared with 158 tons birch and 31 tons pine in 1879, made in 36 ships of 19,406 tons.

The Result in Bayham.

In days gone by the township of Bayham was known as "saw-log Bayham," for the reason that from 1840 to 1855 lumbering was the industry of the municipality. During the early part of that period oak trees were put under contribution and the business was staving. The shipments to the Quebec market were about 100,000 pipe and 400,000 to 600,000 West India staves per year; the exact number in 1845 was 109 658 pipe and 624,707 West India. The pine, however, greatly outnumbered the oak, and although an extensive raid was organized against them they furnished much employment until about the year 1872. In 1849 there were twenty-nine saw mills in the township, and in 1851 the first steam whistle sounded in Port Burwell. Many of the mills would cut 40.000 feet per day. There is not now a single saw mill at the Port, nor six in the township doing any considerable business, but their teeth of steel did in their time cut untold millions of feet of excellent lumber, that found its way over the waters of Lake Erie to the busy marts of the world. From two to four hundred vessel loads were sent per year. Much also was sent uncut in rafts sometimes two miles long.

Trenton.

Messrs. Gilmour & Co's cut of lumber here is 32,000,000 ft., for this season. The firm are employing a number of men enlarging both mills and intend putting in more machinery to make the capacity 45,000,000 ft., for next season, which will give employment to 400 men, making this one of the largest mills in Ontario.

St. John River.

A late New Brunswick paper says :—During the past two months a large number of men and teams have gone to lumber at Burnt Hill, Clear Water and other tributaries of the Southwest Miramichi, on the lands owned by the New Brunswick Railway Company. The operations will be continued until the 15th of April next—this being the specified time when the rafting of the logs will be commenced. It is expected that about 10,000,000 feet will be got out during the winter and then rafted and despatched to Indiantown during the summer by the towboats. The lumber it is said is being cut to the order of Guy, Bevan & Co. Mr. G. Tapley and one of his brothers are to proceed to Burnt Hill, when they are to commence scaling what has been chopped. Messrs. Isaac Stevens and Guy Keswick are to accompany the Messrs. Tapley on the journey. The latter have secured a similar job on the Clear Water district.

At Madawaska the axe of the lumberman will resound through the forests more vigorously than it did for many seasons previous. It is estimated that between 8,000,000 and 9 000 000 feet will be cut during the season's operations. The lumber is intended for consumption among the various sawmills at Indiantown, Straight Shore, Portland, and Carleton. Messrs. G. & Otty Bagnall have been awarded the contract for the scaling of the lumber. Reports from other points show that business in the woods this winter will be carried on with as large extent as possible.

Muskoka.

The Medora correspondent of the Muskoka *Herald* says :—Lumbering is very brisk, both on islands and on mainland How is it that people who buy islands can take off the pine free of stumpage dues. One island in this township was bought for about $270, and the pine alone on it sold for $3,500, or something like that ;—not a bad speculation. The beauty of the lake will soon be a thing of the past, if this stripping of islands goes on much longer.

Last week's *Star* contains the following :—"The Parry Sound Lumber Company's Mill was shut down for the season last Saturday, owing to the weather. It was the intention of the Company to have kept the mill running for some time yet. The season's cut has been very large, reaching close to sixteen million feet. Taken altogether this has been the best season for the lumber trade for many years. How the next season will turn out it is hard to say. Wages and supplies are higher and, from present indications, the weather threatens to be very severe and the snow unusually deep. This will, of course, increase the cost of production of timber, and the prices will have to remain at a good figure in order to make it pay."

The Upper Ottawa.

A reliable correspondent sends us the following estimate of the quantity of square pine being got out on the upper Ottawa and tributaries this winter :

	Cubic Feet
Alexander Fraser	800 000
British Canada Lumber Co	600 000
David Moore	550 000
P. McLaren	450 000
B. Caldwell	450 000
McLachlin Bros	400 000
A & P. White	300 000
J. R. Booth	300 000
L Banque Nationale	250 000
Tuistle, Francis & Co	250 000
Allan Grant	250 000
Wm. Mackey	250 000
A. Barnet	250 000
Jas. MacLaren & Co	200 000
O Latour	200 000
J. & G Bryson	200 000
Gillies Bros	150 000
Hilliard & Dickson	150 000
L. White	150 000
R & J. Klock	100 000
Bell & Hickey	100 000
Jas. Bonfield	100 000
R. Campbell	100 000
Jas. Findlay	100 900
J. T. Brown	100 000
Other firms, say	600 000
Total	7 350 000

MINING NOTES.

Extensive operations will be carried on in the Mississippi mine this winter. Four steam drills were taken out to the works on Saturday, which will be placed in position at once.—Smith's Falls *News*.

Mr. Hall, from the Fifteen Mile Stream gold district, is in town, having brought with him three bricks of gold. Each brick weighs over one hundred ounces, and the whole is the result of the labour of seven men for three months.—*Halifax Exchange, Dec.* 2.

Important discoveries of gold and silver quartz ledges have been made in Nasse river in the vicinity of Alaska. Specimens which have been shown in town are very rich. The miners think that the ledges are located in British territory, but they are very near the boundary line.

Three men were seriously injured last week at the Hull iron mines, in the employ of Col. Robbins. When about leaving for the day a large piece of ore fell from the shaft, some eighty feet, Angus McMillan and Michael were so seriously injured that their recovery is doubtful.

A private letter received at Ottawa from New York city announces the arrival of another party of French capitalists, who visit this continent to seek a field for investment in mines. Efforts are being made by gentlemen here to induce them to visit the valuable mining properties in different parts of the Dominion before returning to France.

Railway land has lately taken a jump, and is held at stiff prices. Belt "E" land now brings $2 above the Government price, or $2.90 per acre. Good sales are frequently made; Mr. J. I. Johnston, last week, sold 480 acres in the Pembina Mountain district to an Ontario gentleman for $1,600.—*Emerson International.*

Mr. Antoine Gaudaur has returned to Coboconk, from the north where he has been for the past six weeks making an estimate of the timber lately come into the hands of the Toronto bank. We understand the report is favourable for the bank and that there is no doubt but we shall have another mill running here next summer.

Sitka (Ala.) advices state that the town was visited by a severe cyclone and a heavy shock of earthquake on Oct. 25th. The wharf was wrecked, and many roofs and fences demolished. A party of miners returned from the interior of Alaska and the head waters of the Yukon River report finding numerous gold deposits and indications of rich placers. Another expedition will go out next season.

The Smith's Falls *News*, correspondent says:—Mr. M. Norris, foreman for a smelting works company at Port Leyden, Jefferson county, N. Y., has been here looking for men to fire. He offers sixty-five cents for chopping hemlock into cordwood to be converted into charcoal for smelting purposes—this is without board. This is a good chance for the number of unemployed young men to be seen almost everywhere.

The Perth *Expositor* understands that Mr. Boyd Caldwell has received an offer of forty thousand dollars for his iron mine in Lavant. It is undoubtedly a fine deposit, and when the Kingston & Pembroke Railway is extended to Renfrew, it will be within a convenient distance for shipping. The Kingston & Pembroke Railway will develop an excellent mining and lumbering district, and we hope soon to see it extended to Renfrew.

Mr. A. A. McLachlin, Coboconk, has sent some samples of stone to Toronto to be tested there as to its suitability for foundations for the new permanent buildings. I am told that they are the strongest of twenty-two varieties received. The same gentleman is also forming a syndicate for the working of an iron mine near Gull Lake. I am told lithographic stone is to be quarried in the spring and that phosphate mining will be one of our next year's industries. If all those expectations are realized Coboconk will leap from its present lethargic state to a position of provincial prominence.

A Kingston paper says:—Aarrangements are nearly completed for the establishment of a new industry—the manufacture of charcoal and iron. It is not definitely known where it will be located, but it is likely that a position convenient to the Mississippi mines will be chosen. The company has been organized, and is composed of some of the wealthiest citizens. It is intended to commence operations with a capital of $40,000, merely manufacturing charcoal blooms at first, but if the undertaking proves a success, the capital will be largely increased, and operations extended to the manufacture of bar iron, Canada plate, and boiler plate.

The *Sentinel-Star* says that on Monday afternoon Mr. Robert Elliot, who has been working in Madoc all summer, left at this office specimens of the fossilized wood now being mined at that place. The specimen he procured for Dr. Hanel, science master is at Victoria college, but the curious can see them at this office for a day or two. Mr. Elliot states that the material in the mine has the appearance as if a forest once stood there and that the trees had been prostrated by a hurricane, which is probably the way the deposit occurred. This wood, which has been "turned to stone," is mined in large quantities, and is sent to the other side where it is ground and made into a fire-proof paint, a peculiarity of it being that fire has no effect upon it.

Mr. Church, who recently returned from the new gold fields north of Lake Superior, reports to the *North Shore Miner* that he traced the course of the vein for six miles, and it had an average breadth of from 35 to 40 feet. A recent assay showed a yield of $24 16 of gold and silver to the ton of quartz. Mr. Church, the discoverer, has spent over ten years in California, and feels warranted in saying that this newly discovered mineral country bids fair to rival any gold region he has ever seen. The topography of the district is briefly described as rocky and undulating, well timbered with white and pitch pine, birch, balsam, and tamarac. Soil mostly of sandy loam. The scenery is also very fine. Several rapid streams traverse the location, and near the vein is a water-fall of great force, that will at no distant day be made to combine the useful with the beautiful.

A writer in the Picton (N. S.) *Standard* calls attention to the advantages offered by that locality for the iron industry. The qualities of the different ores, the nearness of coal and lime, and the facilities of transit, make the future of mining and manufacturing operations very promising in Hopewell and neighbourhood, a few miles from Pictou, where the writer thinks there is the making of a Carron, or a Merthyr Tydoil. In view of the fact that steel rails are being largely imported into the United States, just because the demand exceeds the supply, and the enormous requirements of the Pacific Railway, it is claimed that the ability of the Pictou's iron region should not be overlooked. An outlay of two millions in the home manufacture of the rails required for the Canadian Pacific would eventually be the saving of five. It is urged that a representation should be made to the Canadian Syndicate of Nova Scotia's prospects, and an inspection invited, with a view to their appropriation.

Closed for the Season.

The *Lumberman Gazette*, Bay City, remarking on the sudden change to winter weather, says:—"Nothitstanding the premature closing of the sawing season, by which the the cut has been curtailed some 20,000,000 feet, the umber product of the Saginaw valley for the season of 1880 will be found exceeding ly large. The estimates made by some of the mills which have shut down show that there has been a large increase over 1879 The product of 1880, in this district, will not be far from 775 000,000 feet, an increase over last year of 50 000.000 feet. It seems probable that notwithstanding the large shipments of the season there will be left over unsold a larger amount of lumber than at the close of the season of 1879. It will be of the coarser grades which have been slow of sale. Should it be as much of a drug next year as this the accumulation may have a depressing effect on the market. The proper way to prevent such an outcome is to exercise more care in the select on of timber this winter, to the end that a better quality of stock may be secured for next season's cutting. Taken all in all, however, the season of 1880 will be regarded by the manufacturers of lumber as one of unvarying success. The average price realized has been nearly two dollars per thousand feet greater than that of last year, while the addition l cost of manufacture has not been to exceed fifty cents. Of course the increasing value of stumpage must be considered when profits are being counted. The sea on closes prematurely, but not much fault will be found therewith, as the result will be to merely transfer operations in the woods.

LUMBER NOTES.

The shipments of lumber from Minneapolis from Jan. 1st, and including Nov. 6th, 1880 was 144 290.000 feet; same time last year 129,050, feet; same time in 1878, 108,730 000.

The Alpena pioneer says: The late storm made the lumbermen look blue. Many of them had their yards full of lumber to ship, and their booms full of logs to cut, and it looked as if thousands of dollars needed in their winters work would lie in the booms and on the piles.

A black ash tree with beautifully figured grain, cut in Western Ontario, when cut up sold in New York for $3 000. The stump sold for another $100. The product was used for veneering.

The N. Ludington company's mill at Marinette, Wis., has run 195 days this season, cutting 25 000.000 feet of lumber, 6 250,000 shingles, 4.500,000 lath and 1,000,000 pickets. The company has seven camps, employing 175 men, in the woods.

During the past season the Tittabassee boom company has rafted 3,994 997 pieces against 3 217 640 pieces for 1879. It is estimate that the number of feet will reach 575,000,000. The tootings are not completed. For the season of '79, 445,000,000 feet were rafted.

Business in the district (says the Albany *Argus*) has closed for the season of 1880. Many of the trade have already left the District and taken up their winter quarters in their city offices. It is estimated that of pine lumber there is at least 15,000,000 feet sold which will be wintered over here, of which about 5,000,000 is afloat. Of hard wood from 300 000 to 350,000 feet have been sold, but not delivered; some of it will go forward during the winter. It is estimated that between Albany and Whitehall there are thirty-five boat loads of coarse lumber frozen in on the Champlain Canal bound to Albany. Shipments are being made by rail to New York and South.

The *Northwestern Lumberman* says:—"We are not alone in our suprise at the outcome of the log crop of Michigan for the winter of 1879-80, which was legitimately supposed to have been much curtailed in consequence of the unfavourable character of the winter for logging purposes. A less favourable winter for getting in logs than was the last could scarcely have been imagined by the lumberman who were engaged in the business. Logs cut as long ago as ten years have been received in quantites, while those cut six or eight years ago, and with marks long since out of record, have come equally free in quantity. The amount of rain which has fallen during the summer has kept the rivers of Michigan during nearly the entire season at a driving stage of water, and the opportunity has been improved to sack the shores of the rivers of the logs which year after year have accumulated.

The Kennebec, (Me.) lumbermen are very active now in preparing for their winter operations. Some have already sent in small crews, S. A. Nye having a crew on No. 3 one week. Messrs. N. Torman & Sons, E. Totman & Co., and A. H. & C. E. Duren, will start a portion of their crews this week, the remainder to follow later in the season. The total amount of cuts will be about 14,000,000 feet, divided among the different firms about as follows: E. Totman & Co 4,000,000; N. Totman & Sons, 4,500 000; S. A. Nye from 25,00,000 to 3.000 000; H. & C. E. Duren, 2,000 000. A large number of men and teams will be employed. A large number of firms had a large portion of their last year's cut left in the river, the water being so low that they were unable to drive them. These, together with their present operations, will make business lively next season.

The English papers tell of a priest near Tralee, Ireland, who made his congregation, at two masses, promise on their knees not to imbrue their hands in the blood of one of his parishioners—a large land agent.

Ohio, now the second coal State in the country, will mine over 7,000 000 tons this year, against 6,427,379 in the year ending the 31st of last May. Four new fields have been opened this year—Calton in Jackson county, Corning, in which Governor Foster is interested, in the Sunday creek valley, Del Roy in Carroll county, and Wheeling Bank, along the extension of the Cleveland, Tuscaroras Valley, and Wheeling road.

MILLING NOTES.

Last week a shipment of 1200 barrels of flour was sent from Guelph to Mr. Gibson the extensive lumber merchant on the St. John River, New Brunswick.

There were received at Collingwood during the season of navigation 3,868,455 bushels of corn and 633 410 bushels of wheat, making a total of 5,501,884 bushels.

A new mill has been opened at Woodbridge, Ont., by Mr. William Mackie, which is known as a "woollen extract mill." He purposes utilizing old carpets, old coats or dresses, or any articles containing wool, by a process which separates the woolen from the other fibre in mixed goods. The wool so obtained is to be used in making a variety of fabrics.

The receipts of grain and flour, reduced to bushels, at Buffalo, from the opening of navigation to November 1st, according to the Buffalo *Commercial Advertiser*, amounted to 100,000,000 bushels, or 50 per cent. more than for the corresponding period last year, and 37 per cent. more than the largest amount received in any preceding year. The larger part of the grain was forwarded east by canal, the amounts so shipped being 63,289.404 bushels, against 46 845 194 bushels in 1879 and 53,238,725 bushels in 1878. More grain was received during October than in any other month, the quantity being 16,186,000 barrels of flour. 25,100,000 bushels of wheat, and 35,250,000 bushels of corn, against 3,863 barrels of flour. 25,100 000 bushels of wheat, and 10 000 000 bushels of corn last year. The *Advertiser* adds that, "to have transported the 73,350,000 bushels of grain and 18,000 barrels of flour by rail, would have taken 35 trains of 20 cars each per day for six months, including Sundays."—*Bradstreet.*

HALIFAX AND THE GRAIN TRADE.

Sir Charles Tupper, in reply to a letter of Mr. Doull, President of the Halifax Chamber of Commerce, states that if an experiment now being made should succeed, the Government will submit to Parliament a proposal to erect an elevator in that city. Two cargoes are to be sent over the Intercolonial Railway to test the practicability of sending produce by this route. In proposing to erect an elevator, the government goes very far; and the only justification for the step, is that the shipping of grain by this route is yet in the experimental stage. In most cities, elevators are provided by private enterprise; but capitalists are here not willing to risk anything on the success of a business which has yet to be established. It is only in the exent of the experiment now being tried proving successful that the government is to build an elevator. Will two cargoes furnish sufficient experience to draw a conclusion from? If Halifax capitalists had no doubt on this point, it would be strange if they threw away the chance of the profits which an elevator might be expected to make. There is probably a more brilliant future in store for Halifax than its citizens believe. It becomes them, we think, to be more self-reliant and enterprising. The Winter terminus of the Pacific Railway on the Atlantic must become a city of great importance.

THE UNITED STATES' WHEAT CROP.

Bradstreet's final summary of the wheat yield for 1880 for the entire wheat growing regions of the United States is as follows:—Western States, 323 675 000 bushels; Pacific coast, including Washington Territory, 39 300 000 bushels; Southern States, 41.929,000; Middle States 36 595,000; Colorado and Territories, 12 850,000; New England, 1,100 000; grand total, 455 649 000. The needs of the country for food, seed, etc., is placed at 265,000 000 bushels. On this basis there will be left a margin of 190,724,000 bushels for export to supply the deficiencies—Switzerland, Spain and Portugal, 6 000,000 bushels; Italy, 5,000,000; Great Britain, 120,000,000; France, 42,000 000; Holland and Belgium, 14,500 000; Germany, 20,000,000; West and East Indies and Central and South America, 2,000,000.; total, 327,500 000 bushels. Apparent surplus production, 27 250,000 bushels. The wheat crop of 1880, as estimated by the Department of Agriculture, amounts to 480,849,723 bushels, against 448,755,118 bushels last year.

They have a new way of curing women's hysterics in India. They tie the patients hands and feet together and then thrust cotton wicks steeped in oil up their nostrils and into her ears. A woman who has had hysterical dumbness will recover her speech in a very short time under this treatment.

AN ENGLISH WAR CORRESPONDENT.

"Archibald Forbes once a private soldier? Then his origin must have been very humble and his education self-acquired." Not so fast, good readers. There are those who have poverty thrust upon them, and others who thrust poverty upon themselves. I am afraid Archibald Forbes belonged to the latter class. His father, Louis Forbes, was a Presbyterian Doctor of Divinity, while his mother belonged to the old family of Leslie. Living in the north of Scotland, Forbes studied first at school, then with a tutor, and finally at the Aberdeen university. Though excelling in classics, he had such an aversion to mathematics that when the senatus academicus recently proposed to confer upon him the degree of LL. D., an irate professor exclaimed:

"I can never consent to such a mockery. As a student Mr. Forbes was 'ploughed' in mathematics. I shall never consent that a man should receive an honorary degree from this university who has failed to pass his examinations."

Fortunately for Forbes, success on the battle-field does not depend upon the appendix of LL. D.

During Forbes' second collegiate year, his father dropped dead in his pulpit. There being nine children, and little fortune, Archibald left Aberdeen for Edinburgh, with designs first upon the law, and secondly upon the church. While endeavouring to decide upon a career, he spent all his money, and fell in love with a young lady, with whom he arranged to elope in a gig on a certain Sunday when the obdurate father was to be at church. Alas, "the best-laid schemes o' mice and men gang aft a-gley?" The obdurate father waylaid our hero, remonstrated with practical determination, and turned the love-lorn youth into a ditch, whence he arose sadder and wetter.

Attaining his majority in 1850, Forbes became possessed of $2,500, and determined to join a cousin in Canada who owned a large tract of land near Lake Huron. On reaching Quebec, he lingered in the old town, held by the beaming eyes of his landlord's daughter. At the end of three months, the wild Scotchman had exhausted his resources, confessed his poverty to the landlord's daughter, and abandoned the idea of joining his cousin. With eight shillings in his pocket, he shipped for home as a sailor, and steered twelve hours a day for weeks, when his vessel became water-logged. No timber-ship can sink, otherwise Forbes would have gone to the bottom. There was no cooking for a week, life being maintained on biscuits and salt meat. After several sailors had been washed overboard, the crew took to the boat, which was picked up by the cotton ship Moses Taylor, from New Orleans. Finding that the crew were sadly diseased, Forbes, who had studied medicine *en amateur*, got out the medicine-chest, killed one patient and cured the rest. Of course his susceptible heart fell a prey to the captain's daughter, upon whom, when bidding her farewell in Liverpool, after three month's taste of salt water, he squandered his last eight shillings in grapes.

What was to be done? Never without resource, Forbes sold a fine field-glass, and, with the money, went to London, where he was recruited in the Royal Dragoons. Despite his tendency to "larks," he made rapid headway. In addition to his appointment as school-teacher to his company, Forbes was made acting-quartermaster-sergeant, without the rank of sergeant, is he happened to be the only man of his company who could solve the following stupendous problem in mental arithmetic,—"If one man is allowed the thirty-seventh part of an ounce of pepper per day, what is the amount to be drawn for two hundred men per week." Having compassed this, Forbes was let off from punishment drills, and became an object of admiration to his companions. Already articles by him had been accepted for "Household Words" and the "Cornhill Magazine." Shortly after, he competed for a prize essay of fifteen guineas, to be written by a working-man, "On the advantages the mother-country derives from her colonies." He was then stationed at Weedon, where libraries are conspicuously absent, and as he knew nothing about the colonies, how could he obtain dates? Discovering an old encyclopædia, he collected his material from it, wrote his essay, and secured the prize!

Owing to literary earnings, Forbes had more money than his fellows, and consequently got into frequent trouble. His colonel—now General Wardlaw—was a strict disciplinarian, and meted out punishment unflinchingly. Toward the end of his military career, which lasted five years, Forbes bore a very good character—a happy change, which would probably have led to promotion had not his health given way and caused him to be invalided. After enduring ignorant army-hospital treatment for eighteen months, he went to London, got well in six weeks, and was then sent to Aldershot to show the military surgeons how easy had been his cure.

In losing an obstreperous soldier, England gained a new species of correspondence. Forbes's first contribution to journalism was published in 1865, in the "Evening Star." He became a casual writer on the "Morning Advertiser," and once received eighteen pence for a paragraph accepted by the "Daily News." On this promising income he married; after publishing an article in the "Cornhill" on "Army Reform," and another in "St. Paul," entitled "Soldiers' Wives," both of which were well received, Forbes started a paper called the "London Scotsman," intended like every other newspaper, to fill an aching void. It provided Scotchmen with condensed news from their own country, but as they either failed to see its necessity, or expected to get it for nothing, the editor did not amass a fortune. He eked out a precarious existence by occasional dramatic and musical criticism contributed to the "Morning Advertiser."

Unfortunately for art, Forbes is not the only example of the wrong man in the wrong place. When sent to pronounce upon the merits of a performer on the pedal pianoforte, the ex-soldier regarded the artist from a gymnastic point of view and praised him as an acrobat!

On the breaking-out of the Franco-German war, Forbes was engaged in writing a novel for his paper, while cherishing the idea that nature had designed him for war correspondence, an idea he communicated to James Grant, editor of the "Morning Advertiser," who soon after said to him:

"I've concluded to offer you a position as war correspondent. Choose whichever side you prefer,"

Having studied German tactics, acquired a slight knowledge of the German language, and feeling sure that the German eagle would win, the ex soldier-editor went direct to Saarbruck, and witnessed the "baptism by fire," on August 2, 1870. It is strange that he should have beheld the defeat at Sedan, seen Louis Napoleon dead at Chiselhurst, and his son dead in Africa.

At Saarbruck, Forbes helped to save the life of Major Battye, who belonged to the celebrated Indian Guides, and has since been killed in Afghanistan. Following the Germans as a spectator, Major Battye lost his temper on seeing a soldier killed beside him. Seizing the dead man's needle-gun, he opened upon the French, and promptly received a chassepot bullet in the ribs. Forbes picked up the impetuous major, carried him to a place of safety, and temporarily repaired him by encasing him in brown paper plastered over with paste.

Present at the battles of Courcelles, Vionville, and Gravelotte, Forbes advanced with the Germans to Paris. He and his companions were so far forward as to be ignorant of the flank movement to the right which ended in the battle of Sedan, and held on their way alone through Chalons until actually warned by the French in the street to be careful or they would fall into the hands of the Germans, who had been seen in the neighbourhood. Recover touch of the Germans, Forbes was under fire the entire day, and the next morning witnessed Napoleon's surrender to Bismarck. He and his young Dutch companion, De Liefde, were the only civilians who witnessed the historic event.

On the night of the day Napoleon left for Wilhelmshoho, Forbes and De Liefde, being unable to find quarters elsewhere, asked for lodging in the Chateau Bellevue, which had been the ex emperor's temporary residence. Their request was granted but without food. While Forbes was writing his despatch on the table on which the capitulation had been signed, De Liefde sat gnawing a ham-bone taken from their own stores. Failing by this means to appease a ravenous appetite, he threw the bone in disgust upon the table, and upset Forbes's ink. On returning to the Chateau, three months later, Forbes was gravely shown the stain of his own ink as a souvenir of the capitulation! The French commander had upset the bottle in his rage at Moltke's exorbitant demands! It was then that De Liefde and Forbes tossed for the right to sleep in the ex-Emperor's bed. The ever lucky Forbes won. On a little table by the bed, with leaf turned down, was the book which Napoleon had read before going to sleep,—Bulwer's "Last of the Barons!"

Forbes was the first non-combatant to ride round Paris before the city was entirely invested, and while waiting at Meaux for the progress of the environment, he received orders to return home. The "Morning Advertiser" no longer required his services, for the quaint reason that this journal already had a correspondent inside of a city which was about to be beseiged! Forbes reached London in three days, sole possessor of information concerning French plans. As his essay in war correspondence had abruptly ended in recall, he concluded to return to his miserable "London Scotsman." However, he determined, if possible, to sell his knowledge. As "The Times" turned a deaf ear to his application, Forbes stood in Fleet street, and tossed "odd man out," to which of three papers—"Daily News," "Standard," and "Telegraph"—he should go with his copy. The "Daily News" won the toss. He found favour at last, and was told to write three columns. On returning to the office to state that the subject was not yet exhausted, the editor replied:

"Write on, then, until it is. We'll take as much as you like of *this* kind of copy."

Forbes wrote six columns and arranged for another article to appear the day after, but when he presented his second manuscript the manager said:

"I don't think we want it."

The tone greatly irritated the already jaundiced Forbes, who politely requested Mr. Robinson "to go to the devil," and then proceeded to go elsewhere himself. Chasing the correspondent up the street, the manager finally overtook and calmed him by the magic announcement:

"I want you to go to Metz to-night for us."

It was four o'clock in the afternoon: Forbes left three hours later. This was his first engagement upon a journal with which he has been connected ever since."

At Metz Forbes began to revolutionize war correspondence by living on foreposts, witnessing every fight, and substituting for curt telegrams of bare facts, long descriptive letters telegraphed in full. According to Forbes, successful war correspondence depends upon three attributes:—faculty of organization, capacity of physical endurance, and the gift of lucid writing, resulting from studiously acquired military knowledge. From a journalistic as well as from a military point of view, the base of a campaign must be secure; open communication and presence in the right place are indispensable. Forbes seems to sniff a battle afar off, and is ready to live in squalor, as he did for six weeks within easy range of French cannon before Metz capitulated. It was the wettest autumn on record, and typhoid fever and dysentery were his constant companions. During a sortie, Forbes received a flesh wound in the leg which continued open for months, but which did not force him to leave the front. For these six weeks he did not sleep in a bed except on occasional visits to the telegraphic base at Saarbruck. Before the capitulation was effected, he was the first to enter Metz, and informally joining the sanitary volunteers, he devoted himself to the removal of sick and wounded, 2000 of whom were in a state of semi-putrefaction. As the most infectious disorders reigned, including the rare type of fluury typhus, Forbes's leg was attacked with gangrene, which had to be burned out with nitric acid. By constant smoking, never removing his boots, and carrying in his mouth a sponge saturated with vinegar, he managed to keep on his legs, but was finally ordered to England, lest, by a longer stay in so foul an atmosphere, amputation should become necessary.

On reaching London, Forbes showed his disabled leg to Mr. Robinson, who remarked with a shudder:

"As a fellow-man, I say you ought to lay up for six months; as a newspaper manager, I wish you would start for the seige of Paris to-night."

Forbes started immediately, and his leg got well, probably owing partly to his rule of being a teetotaler seven days out of twenty-one. Attached to the head-quarters of the army commanded by the Crown Prince of Saxony, Forbes witnessed the hardest fighting of the siege. After the final bombardment of St. Denis, he contrived to get inside the walls, which had been reduced to a most dilapidated condition, and was offered food by a Protestant pastor. The meat consisted of part of a young gray horse that had been killed by a shell.

During the siege, Forbes wrote letters in full, which were sent to an agent on the frontier, who telegraphed them to London. This feat excited great surprise among the Germans, who knew that Forbes had permission from the Crown Prince to telegraph only short messages from the offices within his army. One day a Forbes telegram appeared dated at a place where there was no telegraph office. It was reported to Prince George of Saxony's staff by a jealous correspondent.

That same night, Forbes dined with this staff, and was asked to explain the incomprehensible.

"Why," he replied, jestingly, "I have my own private wire, and shall telegraph from here directly."

Knowing that orders had been given at Prince George's office to receive no telegram that night from him, Forbes quietly wrote a letter directed to his frontier agent, and put it in the post. The next day, it was telegraphed to London, and copies of the "Daily News" were sent to Prince George with Mr. Forbes' compliments.

Pending the capitulation of Paris in February, 1871, some fifty journalists waited hungrily to enter on the side of Versailles. Forbes arranged to enter by the north, through St. Denis, and accomplished his purpose on horseback, dressed as a Prussian, and was, in consequence, very nearly killed by a drunken National Guard. Having little knowledge of French and no knowledge whatever of Paris, he had great difficulty in finding Mr. Washburne's bureau, where sat Colonel Hoffman, who gazed with surprise upon the first man he had seen from the exterior world. He sent the stranger to Unthank's English Hotel, in the Faubourg St. Honore, the only hotel open during the siege. Forbes brought forth from his wallet five pounds of sliced ham, which Unthank's people put on a large covered plate and exhibited in the Faubourg at ten centimes a peep, as the first outside marketing to enter Paris.

After walking about dark streets all night, Forbes, who had stabled his horse without leave, rode to Vincennes, where he passed the Prussian lines. He then galloped fifteen miles to Lagny, the terminus of the German railroad system, which he reached in time to catch the train for Germany, but killed his poor horse in the effort. On went the war correspondent for twenty-two hours, without stopping. Reaching Carlsruhe at two o'clock in the morning, he made his way to the telegraph-office, where the two girls in charge refused to take a long telegram until day set in. Coaxing and bribery, however, accomplished their purpose. At eight o'clock the despatch was finished which gave the first details of the interior of Paris that had reached England for a week. Taking the next train to Paris, Forbes entered the Hotel Chatham on the morning of the third day after his departure, and was roundly chaffed for his delay by two journalists who had just got in. Fancy their feelings on reading the "Daily News"! Couriers were so untrustworthy that it was not unusual for Forbes to carry news to England twice a week. He was often the only passenger, and nearly died from fatigue.

After witnessing the great parade at Longchamps, Forbes on the same day accompanied the German troops into Paris. Leaving the German cordon and entering that part of the town still in French hands, he was assailed by the mob as a German spy. A fight ensued, in which Forbes's clothes were torn off. "Let us drown him!" shouted the mob, who threw him on the ground and proceeded to drag him over the stone streets. Rescued by a National Guard picket, the supposed spy was taken to a police-station, and brought before a magistrate whose sister spoke English, and who testified her belief in Forbes's representations. On being released, Forbes borrowed apparel from the brother of his benefactor, who accompanied him to his hotel. "How can I repay you for all that you have done for me?" asked the correspondent. "More easily than you think," replied the Frenchwoman. "My brother and I are literally starving. He has received no salary for six months, and, as gentlefolk, we cannot stand in the queue with the populace to receive alms. Doubtless you know persons connected with the distribution of England's gift. Any food will be a godsend." As one of the

English Almoners happened to be staying at Forbes' hotel, a hamper was dispatched to the Frenchwoman, who went away sobbing like a child. That same night, Forbes started for England, and wrote his account of the entrance into Paris before he had washed the blood-stains from his head and hands. This account appeared in a special edition of the "Daily News," and the next morning Mr. Robinson found his correspondent asleep on the floor with the London Directory for a pillow.

On returning to Paris, just as the Commune was collapsing, Forbes entered by La Chappelle gate, and the same afternoon reached Dombrowski in Chateau La Muette. While dining, the report came that the Versaillists had forced the Porte de la Muette. Desperate fighting ensued, during which Dombrowski, who had mounted a wall, was wounded, and fell into Forbes's arms. All then ran away. The next morning, Forbes was "requisitioned" by the Communists to aid in erecting a barricade across the Rue Rivoli, and again, later in the day, to defend an indefensible position, the defenders of which promptly disappeared. Some hours after, Forbes stood behind shelter in Rue LaFayette and watched the Versaillists take the Grand Opera House. There followed a pandemonium of indiscriminate slaughter. Unable to communicate with England, Forbes got out of Paris with great difficulty, and brought to London the news that Paris was in flames. He returned to the distracted city in time to witness the final down'all of the Communards in the slums of Bellevue and in Pere la Chaise.

On the abdication of King Amadeus, Forbes visited Spain to watch the new republic, the difficulty of directing which was materially enhanced by the purity of its leaders. They would neither bribe nor be bribed, and without bribery no government can live in Spain. Castelar is a dreamer whose aspirations are too good for this work-a-day world. Figueras resigned because, by his own confession, he had not iron enough in his system to be a leader of men. Finding the republic a myth, Forbes, in 1872, went in search of the civil war in Catalonia, and found Contreras in command of the Republican troops at Barcelona. This fat scoundrel, who in a carriage looked as broad as he was long, afterward conducted the communistic insurrection in Carthagena, when a penny post-man and a shoe-maker were joint presidents. Forbes tried to induce Contreras to march against the Carlists, and finally the fat commander succeeded in getting his army one day's march out of Barcelona, on the conclusion of which feat the army triumphantly mutinied, and were gloriously marched back. Disgusted with Contreras, Forbes underwent four months of bushwhacking with the Carlists, whom he found personally pleasanter than the royalists. They had little fighting capacity, but died like gentlemen.

Returning to England, Forbes suggested the Ashantee war in a letter to the "Daily News," his propositions being carried out immediately, and their utility being unofficially acknowledged by military magnates. Bad health prevented the inventor of this war from reporting it.

In the beginning of 1874, a famine desolated Tirboot, a densely populated district of Bengal, where the people swarm like flies. Forbes passed the summer among these miserable people, numbers of whom died, though $15,000,000 were expended in mitigating the horrors of the situation. One great difficulty in preventing starvation arose from the existence of caste. No food cooked by one caste could be eaten by another. Forbes saw a woman come to a trough for food who, on observing that the people handling this food were of inferior caste to herself, lay down and died with her infant in her arms!

After receiving a sunstroke from which he lay insensible for two days, Forbes returned home after eight months' absence. He became cognizant of the intrigue for the restoration of Prince Alfonso of Spain, who was then a boyish fellow, and a fine rider, with a certain dignity, and a certain amount of ready brains. Accompanying Alfonso to Madrid, Forbes assisted at the coronation and followed the king to Navarre in pursuit of Carlists, who were finally paid to give up a lost cause.

Gladly leaving the land of hidalgos, in August, 1875, Forbes went with the Prince of Wales through India, where life was made up of pageants that unrolled themselves like gorgeous panoramas, and displayed the jealousies of native princes who quarrelled about precedence, scowled, sulked, and even went away altogether. But, though these princes hated each other, they learned to esteem the Prince of Wales, whose manners toward them were irreproachable. He combined tact with dignity, and always did the right thing at the right time. According to Forbes, England's hold on India would not be worth a month's purchase but for military rule. All save traders, detest the English, and they are only friendly through interest. British military rule is a semi-depotism, not always wisely directed

April, 1876, found Forbes again in England, but the breaking out of the Servian war caused him to join General Tchernayeff, a Russian Schlavophil who undertook to organize the Servian militia, and accomplished wonders. By presenting a bold front and throwing up earth-works, he so impressed the Turks with a belief in Servian strength that a war which should have ended in a fortnight was prolonged four months. More than one narrow escape from capture and death served to keep Forbes on the alert, while life in camp was curious enough. On the approach of winter, officers and men were quartered in holes excavated in the ground and covered over with sod. Piled up in the centre of each subterranean camp was a huge fire round which all slept. Mice that nibbled hair and whiskers were frequent companions,—not to mention less agreeable vermin. Forbes brought to Belgrade the tidings of the Servian collapse, having on this occasion seen a battle that lasted nine hours, travelled by post 150 miles, and telegraphed four columns to the "Daily News" in thirty-four hours.

In the spring of 1877, Forbes joined the Russian army in the campaign against the Turks, and, owing to Russian secretiveness, was sorely puzzled to learn where the Danube would be crossed. Thanks to Prince Mirski, who gave him a hint, he was the only English correspondent who solved the problem, and hurrying to Bucharest with the news, again did his journal great credit. Sole English correspondent present at the murderous and disastrous Russian assault on Plevna, in July, 1877, Forbes was decorated with the order of Stanislaus for personal intrepidity in rescuing the Russian wounded. By desperately riding his horse to death, Forbes reached Bucharest—a distance of 100 miles—the day after the battle, and telegraphed eight columns of description, which appeared in the "Daily News" of the following morning. For sixty hours he underwent continuous physical and mental exertion, almost without food and entirely without sleep. The narrative telegraphed to London bore so hard on the Russians, that all anticipated the writer's expulsion from the Muscovite army. Recognizing the truth, however, of the English account, the Russian military leaders instructed their press to accept it as accurate.

Again, having witnessed the fight at Shipka Pass, and being convinced that the Russians could hold their position, Forbes quitted the scene of combat at six o'clock in the evening, on the return journey to Bucharest, and riding all night reached the imperial head-quarters the next morning, having outstripped the Russian couriers. Taken before the Emperor, who was anxious and careworn, and very shabbily dressed, Forbes gave him all the information at his command, and was warmly thanked for his promptitude. Radetsky had exclaimed at Shipka Pass: "I've got this place, and, please God, I'll keep it as long as I'm alive." Forbes assured the Emperor that the Pass *would* be held; but as reports of a different nature reached head-quarters during the day, Forbes passed more than one *mauvais quart d'heure*, the German military *attache* of the imperial staff assuring the Emperor that Forbes had led them astray. At last news came that corroborated his statements, whereupon the Emperor turned upon Major Lignitz, exclaiming:

"You were wrong. I believe Ignatieff's Englishman is the only man among you who knows anything about war."

Forbes and MacGahan shared between them the descriptions of the September attacks on Plevna, which lasted five days. At their conclusion, Forbes, shattered by exposure, fatigue, and fever, abandoned the field and nearly died at Bucharest. He left the interest of the "Daily News" in charge of those two masters of war correspondence, H. A. MacGahan and F. D. Millet, both Americans and both peers of their English *confrere*. MacGahan died at his post, beloved by Bulgaria, whose wrongs he published to the world, and thereby righted; his death was deplored by friends and employers, as an irreparable loss to journalism. Millet accomplished wonderful feats, and lives to tell the tale in his American studio, where historic painting claims time once given to picturesque writing.

In the summer of 1878, Forbes went with Sir Garnet Wolsley to take possession of that pestiferous island, Cyprus, and, like everybody else, fell a victim to fever. Nevertheless, he contrived to be at Simla, in the Himalayas, shortly before the outbreak of the Afghan war, and at his own peril carried the first dispatches announcing success. The short telegram sent to the "Daily News" bore the date of ten o'clock, a.m. Ten minutes before ten, papers containing his dispatch were sold in Fleet street. The curious fact was due, of course, to the five hours' difference in the time between Asia and England.

Having eaten his Christmas dinner at Jelalabad, Forbes departed for Burmah, intending to interview young Thebaw, the noble Lord of the White Elephant, Monarch of the Golden Umbrella, etc., etc., who had then just attained the throne. He accomplished his mission one week before the young monarch massacred all his relatives. Accordingly, Forbes was accused by the Calcutta press of having gone to Mandalay for the purpose of bringing about this Christian catastrophe, and thus scoring a sensation! On his way down the Irrawaddy, Forbes read the telegram which recounted the disaster of Isandula, and in in an hour later received the curt order, "Go and do the Zulu war" He had a vague notion that the Zulus lived in South Africa, and a geographical friend in Rangoon told him that Durban was the seaport to make for. So for Durban he headed —away across India, from Calcutta to Lahore, from Lahore down the Indus to Kurrachee, from Kurrachee by steam to Aden, from Aden by steam to Zanzibar, and from Zanzibar again by steam down the south-eastern coast to Port Durban. Discovering at Ulandi that Lord Chelmsford was dispatching no immediate courier, the war correspondent started at sundown from the frontier, rode alone through a trackless country swarming with Zulus, and reached the telegraph-wire, a distance of 110 miles, in fifteen hours, whence he sent the earliest account of the victory to England, as well as to Sir Garnet Wolseley and Sir Bartle Frere. His report in the "Daily News" was read aloud in both Houses of Parliament, amid clamourous applause. Anxious to give details to Sir Garnet Wolsley, Forbes continued his ride to Petermaritzburg, 170 miles farther on, which he accomplished in thirty hours. The entire ride occupied ninety-six hours, three of which were given to sleep. All this was done by a man with a contusion on his leg, caused by a spent bullet received at Ulandi, which afterward suppurated, and compelled his return to England.

During his enforced vacations, Forbes has lectured on the Franco-German war and the Zulu campaign, and has by special invitation addressed the United Service Club, the highest military institution in England, on "Russian military operations in Bulgaria." On this occason the Duke of Cambridge paid him the compliment of offering to take the chair. While thanking the commander-in-chief, Forbes said that he would be more appropriate if his old colonel, now General Wardlaw, should preside. The General did so, and when the lecturer stated that he was proud to see in the chair a gallant officer who, in times long past, had more than once issued the stern edict, "Let that man have ten days' pack drill," the confession was greeted with shouts of laughter, in which General Wardlaw heartily joined, declaring, on rising to propose a vote of thanks, that he had no recollection of the little occurrences referred to, but if ever he *did* give Mr. Forbes punishment drill, it was doubtless most richly deserved.

Such is the the outline of Archibald Forbes's career—a true war correspondent, who thinks a fight the most exquisite delight in the world, and considers a complicated technical battle the most elevated enjoyment of which the human mind is capable

---

A LITTLE boy, named Johnny, from the interior of the State, who had been raised on a stock ranche, and had heard a good deal about the consequences of stockmen killing yearlings that did not belong to them, came to Galveston to live. The other day Johnny's Sunday school teacher asked him: "Why did not Abraham offer up Isaac?" "Perhaps Isaac didn't belong to the old man's mark and brand."

THE advance sheets of Lord Beaconsfields new novel *Endymion* were recently laid before the Queen by his private secretary, Lord Rowton, for her opinion in relation to its treatment of political matters.

ITEMS OF INTEREST.

CYRUS W. FIELD, with his wife, son, and daughter-in-law, are going around the world. They will not go in eighty days—but in a steamboat.

ASTRONOMICALLY speaking, the orbits of the lordly turkey and cranberry sauce soon cross each other, and these two will then be in conjunction.

THE daughters of the Duke of Richmond are persistent and successful fisherwomen, and as catchers of salmon are said to be rivaling their countrymen.

THE estate of an English miser named Rhodes was lately wound up. It realized $390,000. The sale of his effects in his residence resulted in $28.75.

VERA SASSULITCH, the accomplished assassin of the Nihilists, should come to this country and lecture on "Kings I Have Tried to Shoot." We believe such a lecture would go off well.

AN Englishwoman who wrote to the London *Queen* to know what would be a suitable outfit for Nile travelling, was bidden to get a small riding whip, as the natives are sometimes very importunate, and nothing else would keep them off.

MALTA must be a paradise for habitual topers. In Valetta, the capital of the island, there is now a grog shop for every seventy-five inhabitants, including women and children. In addition to these there are, of course, the soldiers and sailors, who are the principal frequenters of many of these establishments.

LORD HENRY GORDON, brother of the Marquis of Huntly, and formerly of the firm of Newton, Gordon & Co., tobacco and general brokers, is a bankrupt. Lord Henry's grandfather, Lord Huntly, had the same sad fate, and the sheriffs occupied his house. The present peer, an able man of high character, repaired the fortunes of his family by marrying a Manchester millionaire's daughter.

Two sisters at Lackawaxen, P., were engaged to marry two brothers, and the double wedding was to take place about the holidays. Just before the election, one of the girls asked her lover to take her to a Republican meeting, but he, being a Democrat, refused. She appealed to his brother, a Republican, and he accompanied her. The sister who remained at home and the Democrat brother, finding their political sympathies in accord, agreed to break up the previous arrangement and become man and wife. The idea met with favour all round, and the wedding will take place accordingly, each of the four taking a different mate.

SOLOMON JONES of Bloomburg, Md., was 70 when, after many years of poverty, he received $2,000 in pension money. He had no relatives to leave it to when he died, and therefore made up his mind to spend it all himself. In view of the probably short time remaining to him in this world, he felt that he must be fast and furious in his pleasures, if he would spend the whole $2,000. He married a young wife, and gratified her love and dress; he got in a large stock of beverages, and drank them recklessly; he bought a fast horse, and bet on him. At the end of three months the last dollar was gone, his wife deserted him, his horse died, and he is still without any immediate prospect of dying.

Mechanical Invention.

It has been predicted that if mechanical invention should proceed during the next fifty years as it has in the last half century, machinery will supersede all physical and much mental labour. The evil part which it plays in our day is equivalent to the part which the slave labour and the spoils of conquest played in Rome. It is multiplying the indolent employments. Its automacy trains the man into a corresponding automacy which cuts down to a minimum the need of effort for subsistence. Its effectiveness has reduced the hours of labour from eighteen to ten with a rise of wages, and the labour is intermittent because gluts, strikes, and lock-outs alternately intervene. The terms of the struggle for existence are changing. Hard work is less required; Biddy declines service where there are no modern improvements, and Pat will soon follow by refusing to carry a hod without a lift. The upshot is that hard work which underlies striction is coming into disrepute, and raises the question whether we are becoming the victims of our ingenuity.

TORONTO, ONT., DECEMBER 15, 1880.

FOREST TREE CULTURE.

The Dominion Government has made wise provision for the planting in the prairies of the North-West Territories. The Deputy Minister of Interior, Col. Dennis, formerly Surveyor General, has devoted considerable attention to the subject, and has incorporated a code of regulations in the Dominion Lands' Act of 1879 of which the following is a synopsis:—Any person, male or female, being a subject of Her Majesty by birth or naturalization, and having attained the age of eighteen years, shall be entitled to be entered for one legal sub division, not in any case, however, exceeding one hundred and sixty acres, of unappropriated Dominion lands as a claim for forest tree planting On application for such entry the applicant shall pay an office fee of ten dollars for a sub-division of 160 acres; five dollars, if the sub-division be 80 acres; or $2.50 if 40 acres, which entitles the party to enter into possession of the land. The patent may issue on the expiration of eight years; but the land cannot be assigned during that time unless by the permission of the Department of the Interior. At the expiration of eight years, or at any time within five years after the expiration of the said term, the person who obtained the entry, or legal representation, shall receive a patent for the land so entered on proof to the satisfaction of the Local Agent:—1st.—That five acres of the land so entered, in case the same consists of a legal subdivision of one hundred and sixty acres, shall be broken or ploughed the first year after entry, and an equal quantity during the second year after entry; 2. That the five acres of the land entered which have been broken or ploughed during the first year, shall be cultivated to crop during the second year, and the five acres broken or ploughed during the second year shall be cultivated to crop during the third year; 3.—That the five acres broken or ploughed during the first year, and cultivated to crop during the second year as above provided, shall be planted in trees, tree-seeds or cuttings during the third year, and the five acres broken or ploughed during the second year, and cultivated to crop during the third year as above provided, shall be planted in trees, tree-seeds or cuttings during the fourth year: Provided that in cases where the land entered consists of a legal sub-division less than one hundred and sixty acres, then the respective areas requiring to be broken or ploughed, cultivated to crop and planted, under this sub-section and the the two sub-sections next preceding, shall be proportionately less in extent: Provided also, that the Minister of the Interior, in his discretion, and on his being satisfied that any trees, tree-seeds, or cuttings, may have been destroyed from any cause not within the control of the person holding the tree-claim, may grant an extension of time for carrying out the provisions of the three sub sections next preceding: Provided also, that at the expiration of the said term of eight years, or at any time within five years thereafter, the person obtaining such tree-claim, on proving to the satisfaction of the Minister of the Interior that he or she has planted not less than two thousand seven hundred trees on each acre of the portion broken or ploughed and cultivated to crop as hereinbefore provided, and that at the time of applying for a patent for the tree-claim, there are then growing thereon at least six hundred and seventy-five living and thrifty trees to each acre, the claimant shall receive a patent for the legal sub-division entered. If at any time the claimant fails to do the breaking up or planting or either, as required by this Act, or any part thereof, or fails to cultivate, protect and keep in good condition, such timber, then and upon such event, the land entered shall be liable to forfeiture in the discretion of the Minister of the Interior, and may be dealt with in the same manner as homesteads which may have been cancelled for non-compliance with the law as set forth in sub-section sixteen of section thirty-three of this Act. Provided that no person who may have obtained pre-emption entry of a quarter-section of land in addition to his homestead entry under the provisions of sub-section one, of section thirty-four of this Act, shall have the right to enter a third quarter-section as a tree-planting claim; but such person, if resident upon his homestead, may have the option of changing the pre-emption entry of the quarter-section, or of a less quantity of such quarter-section, for one under the foregoing provisions, and on fulfilling the preliminary conditions as to affidavit and fee, may receive a certificate for such quarter-section, or for such quantity thereof as may have been embraced in the application; and thereupon the land included in such change of entry shall become subject in all respects to the provisions of this Act relating to tree planting. Any person who may have been entered for a tree planting claim under the foregoing provisions, and whose right may not have been forfeited for non-compliance with the conditions thereof, shall have the same rights of possession, and to eject trespassers from the land entered by him, as are given to persons on homesteads under sub-section seventeen of section thirty-four of this Act, and the title to land entered for a tree planting claim shall remain in the Government until the issue of a patent therefor, and such land shall not be liable to be taken in execution before the issue of the patent.

DOES ADVERTISING IN A CLASS PAPER PAY?

The question, "does advertising in a class paper pay?" is frequently asked by merchants, and sometimes it is difficult to convince them that, as a rule, it does. Our able contemporary, the North Western *Lumberman*, answers the question so clearly that we transcribe his remarks *in extenso* He says it is a mistaken notion on the part of some, otherwise well informed and enterprising merchants, that advertising does not pay in class journals. Grocers, dry goods merchants, hardware dealers, jewelers, dealers in hats and caps or boots and shoes, in wall paper or books and stationery, and in various other branches of commerce and manufacture are apt to say on being approached by a representative of a class journal. "Oh, that may do very well for men dealing in the goods, recognized as having a connection with that branch of business, but it would not pay me." The fallacy of this line of argument is daily exposed in the experience of the editor of the *Lumberman*, to whom it is a matter of almost daily experience to have the question asked of him, "Where can I buy a certain line of goods to the best advantage?" A jeweler might think a lumber journal a strange vehicle for communicating a knowledge of his business to a profitable line of customers, but would have changed his views on hearing the enquiry which was made of us a few days ago by a lumberman, "Where can I get a good gold watch? I've had a rather satisfactory season's business, and I and several of my friends equally prosperous, have to see who you would recommend us to purchase from." There is no class of men who, when prosperous, will more readily and freely patronize a jeweler, than the members of the fraternity of lumbermen.

Carpets are not lumber, and it might appear fruitless to expect benefits to a carpet business from advertising in a lumber journal, but one of the leading carpet houses in this city, trying the experiment two years ago, will yet be found among our regular advertisers, and the house of Judson & Co. is now well known to the lumbermen of the West as among the firms whom they delight to patronize.

Tobacco is a staple in lumber camps and stores supplying goods to loggers and mill hands, and the Durham, which has been constantly kept before the minds of the lumbermen through persistent advertising in these columns, is the favourite brand among the 50,000 shanty men of the Northwest.

We might mention a dozen similar experiences, all tending to prove that no class of merchants can afford to overlook the benefits to be derived from advertising in a lumber journal. There are 70 000 men engaged in various departments of the lumber business between Buffalo and the Mississippi river. This is a vast army, each individual man of which must needs wear clothes, boots or shoes and head covering; they must consume the food which every well conducted grocery is prepared to supply, and no inconsiderable number of the patrons of this journal would gladly open acquaintance with wholesale grocers now unknown to them, who will supply their own extensive retail establishments with the many thousand dollars' worth of stock which enters into the trade with their employes and the general public. No store-keeping lumberman confines his stock to any one branch of trade. His purchases include groceries, dry goods, clothing, crockery, hardware, agricultural implements, boots and shoes, hats and caps, paints and oils, confectionery and tobacco. Whatever his employes or their families require, his shelves are expected to supply. No better class of customers, no better paying patrons, no more reliable and trustworthy men can be found in trade than are the lumbermen, and none whom it will better pay to seek custom from. This journal is a weekly visitor to many thousands of this class, men whose custom might well be sought by dealers in all the commodities which enter into the daily consumption and comfort of man, whether in the line of eating, drinking, wearing or ornament. A recent editorial notice in this journal of an extensive iron manufacturing establishment in West Virginia elicited no less than 70 responses within three weeks, from lumbermen who were desirous of obtaining iron goods. In the woods, sleighs and wagons are used, and no better vehicle through which the builders of these can make known the peculiar advantages of their individual manufacture is open to their choice than is presented in this journal.

There is no class of men more liberal in personal adornment or in the furnishing of their dwellings than the manufacturers and dealers in lumber. When blessed with a prosperous season like the past, it is not in vain that their families suggest the pleasure it would give them to refurnish the old home, to create or replenish a library, to refurnish the parlours and sleeping apartments, to add a heating or improved kitchen range to the department of comfort or convenience, or to array themselves in the beautiful fabrics of the haberdasher or the milliner.

It would be impossible to enumerate the various class of dealers who desire and would be profited by such trade as this journal is well calculated to assist them in obtaining. We would then ask the serious attention of all who deal in goods of any kind, to the proposition that an advertisement in the *Lumberman* is worthy of their test. It is an acknowledged authority among all who have to do with logs, lumber and timber. It circulates in the city and in the country; among the loggers in the woods and the men in the saw-mills. It is found upon the desk of a majority of the lumber dealers of the North, the West and the South, while no considerable section of the country can be found where its presence is not welcomed each week. An advertisement in its columns will, one week with another, attract the attention of at least 30,000, vast numbers of whom, while they may not at the moment be in need of the goods advertised, will not fail to have an impression fastened upon the mind, which in due time will bear legitimate fruit to the advantage of the advertiser.

—The latest discovery of gold has been made right in Halifax city, in the vicinity of Cornwallis street.

To Correspondents.

STADACONA.—Our Quebec correspondent, says the lull in the trade continues. Prices are without change. No further sales will likely be made until after receipt of English statements and circulars at the end of the year. The new regulations of the local government respecting the cutting of timber are very obnoxious to the trade. The feeling represented by the Ottawa lumbermen in their calling a meeting on the 16th inst., is pretty strongly impressed also by the representations of the trade in Quebec city. Messrs. J. Bell Forsyth & Co's annual timber circular, which is regarded as an authority is eagerly looked for. It is expected to make its appearance a few days before Christmas.

CHATHAM, ONT.—The cost of production of steam is estimated at about five pounds of coal per hour, for each horse power. Some improved cut-off engines have been run on two and a half to three per hour. Mr. Doty, of Toronto, has manufactured an improved gas engine, which runs two horse power, without, boiler, engineer or fuel, with 400 feet of gas, or about 40 cents per day.

ELFRIDA.—Mr. R. Quance, has an engine built by Messrs. Killey & Co., Hamilton, which runs a 3 run grist mill, with saw dust as fuel. Mr. Quance expects to have saw dust enough left after cutting up the logs in the neighbourhood to run his grist mill for eight years longer.

ELECTRIC LIGHT.—The cost is about $1—equal 1,000 feet of gas. No patent in Canada. Best consult the Brush Electric Light Company, Cleveland, Ohio.

Foolhardiness.

One of the conductors says that this fall stands forth in unprecedented prominence in the history of the Canada Central for the number of men who have returned from the shanties in a wind broken, wrecked condition of health. Scarcely a train comes which does not bring one or more of these ruined fellows. The source of the destruction lies entirely within the men themselves. After the day's work they gather in the shanty and discuss the day's doings. Some gang boasts loudly of manufacturing eighty logs per day, some seventy, some sixty, but the most fifty—a fair day's work. The fifty lots determine to equal the sixties, and seventies the eighties; and so, day after day, "the fight goes bravely on," until the weaker go to the wall, and are forced to leave. When really ill, shantymen are kindly tended, but when self-spavined the foremen have no mercy or medicine for them, and they are obliged to reach Mattawa or Pembroke as best they can on foot. It is a known fact that some have arrived in Pembroke poverty-struck both as to pocket and as to health, and have been compelled to walk on the railway to Ottawa, begging as they marched.—*Central Canadian.*

Lumbermen's Supplies.

To supply the different mills at the Chaudiere on the Ottawa, which get out an average of 150,000 logs each season, the following supplies are estimated as required during the winter:—825 bbls. pork, 980 bbls. flour, 525 bush. beans, 37,000 bush. oats, 300 tons hay, 3,650 gals. syrup, 7,500 lbs. tea, 1,875 lbs. soap, 1,000 lbs. grindstones, 6,000 lbs. tobacco, 75 boxes axes, 1 doz. each, 60 cross-cut saws, 225 sleighs, 3,750 lbs. rope, 1,500 boom chains, 7 feet each, 45 boats, 900 pairs blankets, 15 cookeries. 375 cant dogs, costing, at a moderate estimate, about $54,367.00.

This service requires in the woods, 450 men getting out the logs, 300 men piling and forwarding, and 300 men teaming, using 300 teams. The average number of men employed by each establishment throughout the year is 637, receiving for pay $306,000. From this it will be seen that the lumber merchants of the Chaudiere alone employ about 4,000 men, paying annually $1,836,000, which is all spent in and around the neighbourhood to the benefit of the trade of the country generally.

Lumbermen's Shanty.

A writer referring to the lumber trade on the Ottawa describes the winter dwelling of hardy lumbermen as follows:—"Having selected a desirable, convenient spot, with a good supply of water, a shanty is constructed of the simplest description, being generally built of rough logs with a raised hearth in the centre for a a fireplace, and an opening in the roof for a chimney. A double row of berths all round serves for sleeping accommodation, while from a wooden crane over the perpetual fire swings the huge kettle which, with the accompanying pot, serves all the purposes of cookery. The domestic economy is conducted upon strict temperance principles; tea is the constant beverage of the lumbermen, and they consume it in quantities, and of a strength which would effectually destroy their nerves if they possessed those delicate organs. In point of fact the beverage of the woodman ought to be called *tea soup* it being an infusion entirely different from that of our city drawing rooms. They place a couple of handfuls of tea in a kettle of cold water and hang it over the fire till it boils and attains a strength and fulness of flavour only palatable to throats which admire body in the fluids they imbibe. Many of these hardy men drink a pound of tea per week, and some of them double that quantity of the Chinese shrub, and without feeling any ill effects either from that or the salt pork which is the other staple article of diet. Perhaps the strong tea counteracts the fat pork, and *vice versa*. The stores of the lumbermen are usually carried up to their forest shanty late in the autumn, and all preparations are made to commence the work of felling the giants of the forest."

Timber Regulations in Quebec.

The morning *Chronicle* says:—The *Official Gazette* publishes the new regulations and amended schedule of dues to be paid by lumbermen working on the Crown Lands of the Province of Quebec. One decided improvement in these amended regulations consists in the reduction of the fee charged by the Government on each transfer of timber limits from four dollars per mile to one dollar per mile. The increased stumpage charged on pine saw logs, from 15 cents the former rate to 26 cents under the new regulations, is complained of by the lumbermen as an excessive advance, amounting to an additional tax of about 75 per cent over and above the rate formerly charged. There certainly does seem to be some reason for dissatisfaction on this head.

Hamilton Exports.

For the month of November, the exports of lumber from Hamilton to the United States, as verified by the U. S. Consul, are valued at $4,516. For the same month, scrap iron export is given at $1 806. It is worthy of remark that scrap iron brings $8 per ton more in Hamilton than in Buffalo; yet the price of bar iron and nails is higher in Buffalo than in Hamilton. The trade in car axles and in wrought iron generally is increasing largely in Canada, and there is no reason why the increase should not continue. Export of barley for November, $10,955; malt, $7 319; eggs, $4,516; wool, $22,556.

Fort Eddy.

The Pembroke *Observer* says:—On Tuesday of last week E. B. Eddy's store at Fort Eddy, on the Upper Ottawa, above Mattawa, was burned to the ground. Hardly any of the contents of the store, we believe, were saved. They consisted of the usual stock of supplies and general merchandise. The origin of the fire is not known.

ROBERT STEWART,

TORONTO.

PIANO SCREWS A SPECIALTY.

Central Prison Industries.

The undersigned will receive tenders up to noon of

Friday. 17th December inst.,

For the delivery in the yard of the Central Prison at Toronto, the following quantities of lumber, viz.:

150,000 to 200,000 feet of basswood lumber in boards 12 feet long and 1¾ inches thick, to be free from knots, shakes, and imperfections.

150,000 to 200.000 feet of maple, beech, white birch, and white ash lumber, of the same dimensions and description.

15,000, feet 1-inch clear pine, 15,000 1-inch 2nds pine.

15,000 feet 1-inch white wood, 3,000 3x3 inch maple.

1,000 feet 2-inch white oak, 1,000 2-inch maple.

5 000 feet 1¾ inch maple 8 inches wide, 29,000 1-inch boards.

The 1¾-inch bass wood and hardwood lumber to be delivered at the rate of 50,000 feet per month, commencing 1st January next. The other lumber to be delivered on or before 1st February next. The whole is to be examined and culled at Central Prison at the time of delivery

Offers may be made for the whole or a portion of the lumber, and the lowest or any tender not necessarily accepted.

Sureties will be required for the due fulfilment of the contract.

J. W. LANGMUIR,
Inspector of Prisons, etc.

Parliament Buildings,
Toronto, 4th Dec. 1880.

The UNIVERSAL SUSPENDER.

SOME REASONS why they are the best:—

1st.—No Elastic requied.
2nd.—Is slack when stooping.
3rd.—It never slips off the shoulders.
4th.—Sold at prices of common suspenders.

Manufactured by C. E. RAMAGE & CO.

90 BAY STREET, TORONTO.

THE
Intercolonial Coal Mining Co.,

offer their fresh mineral bituminous Coal from their

DRUMMOND COLLIERY.

F.O.B cars, deliverable at stations of the Intercolonial and Grand Trunk Railway.

Apply to

Intercolonial Coal Mining Co.,
26 St. Francois Xavier Street,
MONTREAL

The coal is now being received at Toronto by several of the dealers—W. J. Keith, C. J. Smith and others.

JOHN McGREGOR & SONS,

MANUFACTURERS OF ALL KINDS OF

STATIONARY,
MARINE, and
LOCOMOTIVE BOILERS,
and SHEET IRON WORK

Portable Boilers for Threshing Machines, Shingle Mills, &c., furnished on short notice. All Boilers tested by cold water pressure to 150 lbs. to the square inch before leaving the shop.

SECOND-HAND MACHINERY
bought, sold, or taken in exchange for new work.

REPAIRS PROMPTLY ATTENDED TO

183 Atwater St., Detroit, Michigan.
BRANCH SHOP—
Cor. Glengarry Ave. & Stuart st.,
WINDSOR, ONTARIO.

M. BRENNEN,

MANUFACTURER AND WHOLESALE DEALER IN

Lumber, Lath and Shingles,

63, 65 and 67 King William-st.,

HAMILTON, ONT.

Mills and Timber Limits at Silver Creek, Tiago P. O., Ont.

Bill Stuff cut from 10 to 60 feet. Cedar Posts on hand.

Orders sent to M. Brennen, Tiago P. O., will receive prompt attention.

QUEEN CITY OIL WORKS!

ALL KINDS OF

MACHINE

AND

BURNING OIL!

Send for Samples.

Saml. Rogers & Co.,

33 ADELAIDE ST. EAST,

TORONTO.

THE GENUINE

Silver-Steel, Lance-Tooth Cross-Cut Saw!

It stands without a rival, and is the fastest cutting saw in the world. It has beaten the best Canadian and American-made saws 33⅓ per cent. in every contest. Its superiority consists of its excellent temper. It is tempered under the Secret Chemical Process, which toughens and relieves the steel. It gives a finer and keener cutting edge, and will hold it twice as long as any other process. We have the sole right for this process for the Dominion of Canada.

None genuine that are not hereto before cut with registered trade mark with the word "The Lance," and Maple Leaf with our name. Price $1 per foot.

CAUTION. — Beware of Counterfeits. There are inferior counterfeits on the market, which are intended to be sold at a high price upon the reputation of this saw. We will send to any address a saw exactly like any counterfeit, warranted equal in quality or no sale, at 60c. per foot. Therefore do not be humbugged into paying a high price for a second class saw. A fact to bear in mind is that if the material and temper are not of the very best quality the teeth of the teeth amounts to nothing. A saw, like a knife, will not cut fast without it will hold a keen, cutting edge. We have cut off a 14-inch sound basswood log in eight seconds with this saw.

Manufactured only by

SHURLY & DIETRICH,

Manufacturers of Saws, Pastering Trowels, Straw Knives, &c., &c.

GALT, ONTARIO.

December 10, 1880.

A Night in the Sun Office.

THE SYSTEM THAT STRUCK AN OUTSIDE NEWSPAPER MAN AS VERY INTERESTING.

(From the Louisville Post.)

The *Sun* newspaper is a small affair in square inches, but every inch is an institution. The sheet is not as large as the Louisville *Post*, but a comparison of the paper on any day with either of its great New York contemporaries will prove that it contains every item of valuable current news, local, national, or foreign, and hardly a line of trash. Notwithstanding the condensation necessary to secure such results, the paper is written with singular clearness, and is deservedly noted for literary grace. And further, along with all the news, it finds room for pointed editorials—pebbles of hard English well flung—and as much of miscellaneous and interesting matter as any reasonable reader would care to have. In short, the *Sun* is the most complete newspaper in America, supplying everything in such a shape that everything can be read.

With such characteristics it is no wonder that it is the most widely read paper in New York, where nearly everybody is busy; and so long as it is conducted with the present liberality, energy, and care, its continued growth is assured; 127,000 copies are now sold daily, which is one paper to every ten people in New York city, a proportion that is likely to hold in the future, if, indeed, it is not improved with the increase of the proportion of busy people.

A majority of the newspaper men who are familiar with the *Sun* as an exchange, and who know of its great prosperity, have long ago resolved that, if they ever start a paper of their own, the *Sun* shall be their model. Many such attempts have been made and have failed. The Cincinnati *Sun*, a mechanical imitation, a perfect counterfeit, when too far off to read, was the most notable instance. The trouble with all such attempts was that the projectors did not know the New York *Sun* and its system. They imagined that by imitating its size and outward appearance they would save white paper and type setting and still make a bright and successful journal, when in fact the size of the *Sun* is fixed, not to save white paper and type setting, though it does this incidentally, but because it is the smallest size into which all the news can be put and still preserve a clear and pleasant shape. The *Sun* is really run on very expensive principles. The cost of its news, coming through men who are able to condense, is as great as that of any of the monster papers which employ diffuse, ill-paid fellows, and meet their heaviest expense in telegraph bills, paper bills, and the wages of their able-bodied compositors. The *Sun* pays as much for editors to cut out words and leave tangible facts and ideas as the blunderbuss papers pay for writers to coin sentences.

It is only after some study that one can realize what an enormous amount of news a great metropolitan paper must handle before it can be said to "have it all," and it is a matter of real wonder that a little paper like the *Sun* contrives to hold so much. It is a case of the learned man's small head; it is the result of a complete system carried out daily under able management, by the hard work of many bright minds. Just think of the materials that come to the office every day. Though the hundreds of men who gather the news know that their positions depend on their being as brief as is consistent with completeness, they still furnish, at a small estimate, more than ten times as much copy as can possibly be printed. The issue daily of reading matter averages about twenty-two columns; it contains all of value in two hundred columns of copy sent in, from which it has to be extracted and set up within the short space of eleven hours, the greater portion within half that time. I spent yesterday and last night in the *Sun* office to observe the process.

Outside of the editoral work of condensation, the capacity of the paper is enhanced by several mechanical devices. For instance: The type, while clear, is compact and small, being mostly nonpareil and agate; then the headlines, while nicely guaged to suggest the importance of the matter to follow, will be found on measurement, in any case, to occupy very small room. There are other ways in which the types are compressed, but I will proceed now to give an outline sketch of what I saw of the work of the editors and reporters.

Mr. Dana maintains the closest personal supervision of the whose establishment. In the editorial department, which comes perfected from his hands, he is assisted by seven writers. When he goes home, Mr. John Swinton is left in charge.

The city editor has immediate command of forty-two reporters, and his territory embraces New York and the surrounding cities, and a half day's journey into the country in any direction. All the reporters and many of the other writers come to the editoral rooms (a small suite for Mr. Dana and a large hall for all the rest) at 11 o'clock in the morning. Mr. Dana learns the plans of the others for the day, and makes his suggestions or gives his orders, writes a leader and a paragraph or two and assigns specified subjects to be discussed by members of his staff. Before he leaves he reads a revised proof of all the chief editorials.

Distant correspondents are at liberty to send at first only a short message by telegraph, stating the character of the news they have and asking instructions, which are promptly returned to them by telegraph, unless the news comes late at night and is of great importance, when the matter if left to their discretion. The selection and control of correspondents is a vital matter in the *Sun* system.

The city editor and his four assistants keep a very complete assignment book, in which are entered memoranda of every point that ought to be worked on each day, entries being frequently made three months in advance. Besides this book, reporters are kept on duty constantly at the police headquarters in New York, Brooklyn, Jersey City, and neighbouring towns, and immediately on the receipt of a piece of news from any police station it is telephoned to the city editor. Using the book of assignments, the papers of the day, and any hints he may have had from other sources, the city editor directs each reporter as to what he must do, exercising his best care in selecting the men with reference to their peculiar talents for the particular style or kind of work he desires.

About 5 o'clock Mr. Dana steps from his rooms to go home, first stopping to consult with Mr. Swinton and to leave with him a schedule of the editorial matter he wishes to have appear. A calculation is now made to determine how much space Mr. Dana has left, and then the managing and city editors make up their schedules. On a comparison of these it is generally found that each has been too liberal with himself, and both schedules have to be cut to leave a sufficient margin for the certain and probable news, local and telegraphic, that is to come. When the schedule matter is finally made up, it is given to the compositors, who are now all at work. Once on the printers' hooks the schedules, in their outline of space, not in their contents, are absolute. They represent what the paper will hold, and on the receipt of any unexpected matter, either the articles embraced in the schedules or the later news, or both, must suffer condensation or slaughter. It happens occasionally that, piece by piece, the whole of the schedule lists is set aside to make room for more important news, and sometimes a hundred columns of copy very late is reduced to two columns before it reaches the printers. A few weeks ago fifty columns of Washington matter was boiled down to one, and not an important fact was lost.

Before the conference as to the schedules, the city editor has received returns from most of the morning assignments, and has started many of the reporters on new errands. At 6 o'clock the night city editor arrives, who, assisted by the three other city editors, from this time forward directs the reporters and edits their copy, the managing editor keeping him informed as to the necessary condensation.

It matters not how great the rush of matter and the consequent condensation may have been, nor how much of type may have been set aside. The *Sun* forms are locked up at the stroke of a certain hour every morning, and at 3 o'clock the paper may be brought anywhere in New York city. This is one hour ahead of any other New York morning daily, and a second editon is rarely needed to maintain the *Sun's* reputation for printing all the news.

It will be seen, I think, that while the *Sun* is extremely economical of space, and therefore of the time of its busy readers, and though it pays as seldom as possible for redundant words, it is exceedingly liberal in getting the absolute news. Ambitious newspaper men with small capital should not undertake to run a paper on the *Sun's* system, but such a paper is needed in all of our large, busy cities, and the day is not far distant, probably, when the *Sun* will no longer stand unique and alone.

A PLACE for everything—Baby's mouth.

Celebrated Book Stealers.

THE PRIEST WHO COMMITTED MANY MURDERS BECAUSE OF HIS PASSION FOR BOOKS.

(From the London Spectator.)

Many eminent characters have been biblioklepts. When Innocent X. was still Monsignor Pamphilio he stole a book—so says Tallemand des Roux—from Du Monstier, the painter. The amusing thing is that Du Monstier himself was a book thief. He used to tell how he prigged a book, of which he had long been in search, from a stall on the Pont Neuf; "but," says Tallemand (whom Janin does not seem to have consulted), "there are many people who don't think it stealing to steal a book, unless you sell it afterward."

But Du Monstier inclined to a less liberal view where his own books were concerned. The Cardinal Barberini came to Paris as Legate, and brought in his suite Monsignor Pamphilio, who afterward became Innocent X. The Cardinal paid a visit to Du Monstier in his studio, where Monsignor Pamphilio spied, on a table, "L'Historie au Concile de Trento"—the good edition, the London one. "What a pity," thought the young ecclesiastic, "that such a man should be, by some accident, the possessor of so valuable a book." With these sentiments Monsignor Pamphilio slipped the work under his soutine. But little Du Monstier observed him, and said furiously to the Cardinal that a holy man should not bring thieves and robbers in his company. With these words, and with others of a violent and libellous character, he recovered the History of the Council of Trent, and kicked out the future Pope. Amelot de la Houssaie traces to this incident the hatred borne by Innocent X. to France.

Another Pope while only a Cardinal, stole a book from Monage—so M. Janin reports—but we have not been able to discover Monage's own account of the larceny. The anecdotist is not so truthful that Cardinal need flush a deeper scarlet, like the roses in Bions "Lament for Adonis," on account of a scandal resting on the authority of Menage. Among royal persons, Catherine de Medici, according to Brantome, was a biblioklept. "The Marshal Strozzi had a very fine library, and after his death the Queen-Mother seized it, promising some day to pay the value to his son, who never got a farthing of the money." The Ptolemies, too, were thieves on a large scale. A department of the Alexandrian Library was called "The Books from the Ships," and was filled with rare volumes stolen from passengers in vessels that touched that port. True, the owners were given copies of their ancient MSS., but the exchange, as Aristotle says, was an "involuntary" one, and not distinct from robbery.

The great pattern of biblioklepts, a man who carried his passion to the most regrettable excesses, was a Spanish priest, Don Vincente of the Convent of Pobla in Arragon. When the Spanish revolution despoiled the convent libraries, Don Vincente established himself at Barcelona, under the pillars of Los Encantes, where are the stalls of the merchants of bric-a-brac and the seats of them that sell books. In a gloomy den the Don stored up treasures that he hated to sell. Once he was present at an auction where he was outbid in the competition for a rare, perhaps a unique, volume. Three nights after that the people of Barcelona were awakened by cries of "Fire!" The house and shop of the man who had bought "Ordinacions per los Gloriosos Reys de Arago," were blazing. When the fire was extinguished the body of the owner of the house was found with a pipe in his blackened hand and some money beside him. Every one said: "He must have set the house on fire with a spark from his pipe." Time went on, and week by week the police found the bodies of slain men, now in the street, now in a ditch, now in the river. There were young men and old, all had been harmless and inoffensive citizens in their lives, and—all had been bibliophiles. A dagger in an invisible hand had reached their hearts; but the assassin had spared their purses, money, and rings. An organized search was made in the city, and the shop of Don Vincente was examined. There, in a recess, the police discovered the copy of "Ordinacions por los Gloriosos Reys de Arago," which ought by rights to have been burned with the house of its purchaser. Don Vincente was asked how he got the book. He replied in a quiet voice, demanded that his collection should be made over to the Barcelona Library, and then confessed people who had bought from him books which he really could not bear to part with. At his trial his counsel tried to prove that his confession was false, and that he might have got his books by honest means. It was objected that there was in the world only one book printed by Lambert Palmart in 1482, and that the prisoner must have stolen this, the only copy from the library where it was treasured. The defendant's counsel proved that there was another copy, in the Louvre; that, therefore, there might be more, and that the defendant's might have been honestly procured. Here Don Vincente, previously callous, uttered an hysterical cry. Said the Alcalde: "At last, Vincente, you begin to understand the enormity of your offence?" "Ah, Signor Alcalde, my error was clumsy, indeed. If you only knew how miserable I am!" "If human justice prove inflexible, there is another justice whose pity is inexhaustible. Repentance is never too late." "Ah, Signor Alcalde, my copy was not unique!" With the story of this impenitent thief, we may close the roll of biblioklepts.

Marrying a Tenor.

The following is an extract from a letter from the wife of a tenor to her friend!

Yes, Jenny, we have 30,000 dollars a year; the praises of my husband are sounded every day in the newspapers; he is applauded every night; he sings and is a very king in his art. But you don't know what it is to be the wife of a tenor. Those who flatter my husband, and they are numerous, are incessantly telling himself: "M. Michael, you have a mine of diamonds in your throat." That may be true; I don't say it is not, but if you could understand what consequences it entails—a mine of diamonds in a man's throat! Michael is always as cross as a bear because of the state of the temperature. A barometer is less variable. He is continually opening and shutting the windows; when they are open he wants them shut; when they are shut he says he stifles. You have no idea of the trouble we have at hotels to prevent his taking cold. Even the style of carpet becomes a study. And the cartloads of furs we carry about with us! And the difficulty we have with the fires! There is also a long chapter as to what he may and may not eat; this is too strong and that is too weak. And the night he sings there is a syrup which he must drink five times during an act and a wash of brandy and camphor with which to rub his throat. From morning till night a tenor thinks of nothing but himself; he listens to himself sing; he studies poses before a looking-glass; he calls after the servants, "Jean, muffle the doorbell, its noise affects my nerves. Brigette, don't pass before me again; you make a draught." He interrogates his throat every ten minutes, "la, la, lo." Never a sensible word, always "la, la, la; at table he does not talk for fear of deranging his "la, la, la." If I ask him to take me out on a fine day, he runs to the piano-forte and exercises his "la, la, la!"

It was only natural that the States should subside into quietness when their great struggle was over. They *have* accordingly subsided for the time being into speculations, betting over boat races and making themselves comfortable for the winter. The people over there are at present being busy and very prosperous, and when that is the case, they have neither time nor inclination for much else, but to look after the coppers and enjoy themselves.

THE Queen of Wurtemberg's life is regulated with conventual exactness. She is the Colonel of a Russian regiment, and frequently appears at review in her uniform. Her Majesty inherits her father the late Czar's mania for drill and pipeclay. The fat, beer-drinking, pipe-smoking King Cole to whom she is mated used to dispute with her about it, but at length gave in and allowed her to have her head. All he now asks is to be left undisturbed in dens in his palaces, in which he can enjoy a little untidiness.

THE Intercolonial Literary and Anthropological societies, which number among their members such men as Henri Martin, Capellini, Delgado, and Mr. John Evans, of the British Museum, opened their congresses at Lisbon last month; the King, Dom Luis, and the ex-King, Dom Fernando, with the Ministry and all the notables of Portugal, were present. The savants were the guests of the city and of the ex-King, and the King and Queen gave a ball in their honour.

The Montenegrin High Court.

PRINCE NIKITA HEARING THE COMPLAINTS OF HIS SUBJECTS IN PATRIARCHAL FASHION.

There are a few customs and spectacles still lingering in this age to remind us that the world was not always prosaic, utilitarian, and unbelieving—a few survivals of the time when the superstition of the loyalty of all classes found uncriticised expression in magnificent ceremonies. They are dying fast. The simplest, but also the most interesting, of such quaint shows is a seance of the Supe for Court of Appeal in Montenegro. To the left of the palace gate stands a lime tree of very moderate size, surrounded by a bank of turf neatly edged with boulders Hither, towards 8 in the morning, strolls the Prince, followed by his officers and guard. At a certain distance from it they halt and uncover, which his Highness steps briskly forward and seats himself at a square nook left hollow in the wall to accommodate his legs. If personages of distinction are present they receive an invitation to take place on either hand, and the court is open without more ceremony. Sometimes the whole space in front is crowded with peasantry in silent ranks, eager to behold their chief and hear his wisdom; but in this time of war, which makes such heavy demands on the labour of the few who stay at home, the audience is small. I have seldom beheld a finer subject for the painter. At a distance of twenty yards or so, on the right front of his highness, stand the veterans of his bodyguards ranged in line, tall fellows mostly, grim of aspect, wearing crosses and decorations, heavily armed. The long fringe of their plaids sweep the ground, or one end of it is thrown across the shoulders in Spanish fashion. On the other side, at a like distance, stand a group of peasantry, cap in hand, waiting to explain such complicated grievances as neither the village elders' court, nor the district tribunal can arrange to their satisfaction. To the left rear of the prince aides de-camp and attendants of the Waywodes present take up station; they wear their caps, being "out of court," by legal fiction, though nearer to the sovereign than the rest. Everyone being placed, in two minutes proceedings begin. The first complaint, which his highness explained to me on one occasion, was that of a weazened veteran, very ragged and dirty, but wearing two silver mounted pistols and a yatighan. In a sing-song voice, without hesitating for an instant, his petition was made. He had answered the lawful summons of his chief, and repaired in arms to the camp at Sutormans, whence Gen. Bozo Petrovich had dismissed him as too old and war-worn for service. "I am not old, Gospodar," he lamented, "for I am strong. And if I have bullets in my body is that a reason that I should be insulted? I pray you Gospodar, to write to Bozo Petrovich and order him to let me fight." The anxiety of the poor man was painful to watch as he turned his cap ceaselessly, awaiting reply, which was not given in my presence.

Of another suitor his highness told me that in some fight he lost his comrades, and was attacked, all alone, by five Turks. Four he killed and wounded the fifth, but he fell himself in the struggle. Snow lay on the ground, and the evening chill restored him to consciousness. When his eyes opened he saw the Turk painfully crawling to gather wood, and he proceeded to assist the infidel. When certain comrades arrived at dawn they found these two sharing their last ration across the fire, and the Montenegrin would not be removed until he had seen his late foe placed in a litter. Together they were carried to the hospital at Cettinje. A brawny little man of the body-guard was pointed out to me as the hero who brought in a dozen and a half of heads after one battle. The czar presented him with all the decorations possible—I saw them—and the Russian ladies subscribed a pretty souvenir in the form of a head-chopping knife, encrusted with precious stones, at the expense of $1,200. This I did not see, for the owner leaves it with his parents, an example to the youth of that vicinity. In regard to this head-cutting, Gen. Bozo Petrovitch told me that he would not try to stop it, in the hostilities daily expected when I was in his camp. He declared it a modern practice, taught within this century by the invading armies of the porte. Nose-slicing is still more recent, for until late years prisoners was never made. In the last period of the war, however, when whole battalions surrendered, the practice was dropped of necessity, and we may even hope that it will never be revived. The prince himself told me that he made 11,600 prisoners, whom he could not keep for want of means. The Turkish government had none to exchange, and for several good reasons; it would not ransom them; and he was obliged to send them back unconditionally. One officer was captured three times.

Music in Old English Churches.

In country churches the loft was, and even is, usually known as "the singing-gallery," the musical instruments being the clarionet, violin, violoncello, flute, &c. Mr. Noake, in his Rambles in Worcestershire, says that in Tenbury Church, in the year 1771, they were not only horns and clarionets, but also a drum, whose sound was heard in divine service for some forty years after that date. In some country churches the number of the psalm that was to be sung was chalked on a slate, and suspended from the front of the singing-gallery. It is said of the parish clerk of Isle Brewers, Somersetshire, that in giving out the hymn, and suddenly finding that the slate was not hung up, his announcement took the following shape: "Let us sing to the praise and glory — I say, why doan't 'ee hang out the slate?" During the singing the congregation in the nave turned their backs upon the clergyman, and looked toward the singing gallery, where the parish clerk and his fellow-performers were ensconced. In a Yorkshire village church early in this century the instruments in the singing-gallery were the violin, violoncello, clarionet, serpent, and bassoon, and when the old clergyman wished for the "Old Hundred" to be sung, he called out to his clerk, "Straack up a bit. Jock! straack up a bit!" Of this same Yorkshire pair it is related that on the occasion of the first missionary meeting, when the congregation were waiting in the church-yard, the old Vicar said to his clerk, "Jock, ye maunt let 'em into th' church; the dippitation a'nt't coom!" but, on the arrival of the two clergymen who formed the deputation, the clerk called out to the people, "Ye maunt gang hoame, t' deppitation's coom?" The old Vicar introduced the two clergymen in addresses that were models of brevity: "T' furst deppitation will speak!' "T' second deppitation will speak!" after which the clerk lighted some candles in the singing gallery, and gave out for an appropriate hymn, "Vital spark of heavenly flame!' The parish clerks who give out the hymns and lead the congregational singing are probably at the present day only to be found in a few remote places, and in parishes where there is a second church, at some miles' distance from the mother church, with its one Sunday service. Here, very likely, the man is still to be found who unites in his own person both clerk and choir. A friend of mine had such a clerk, and the hymns were those of Tate and Brady. First of all the clerk sounded the note on a pitch-pipe, and after this musicial prelude he wound up his nose, as it were, and, with a strong nasal snarl, pitched the key-note and began the psalm. A great favourite with him was what he called "The Happy Man," the psalm beginning with the line, "Happy the man whose tender care"—which word he pronounced "car"—and the last line of the verse, "The Loard shall give him rest," was repeated twice and shouted with great fervor. The rustic audience were charmed with his execution of this psalm, and are greatly pleased when a Boanerges out of their own ranks can thus display the power of his lungs.

"By Jove!" exclaimed Harry; "look at that girl! What colour! She's the picture of health." Said Dick, who has learned to discriminate between nature and art: "A picture of health! A painting, you mean."

YOUNG lady—"Very changeable weather, Mrs. Wiggins, isn't it?" Mrs. Wiggins—"'Ees, miss, it be. Fust 'ot, yer see; then co'd, then 'ot ag'in; but it's a blessin', 'cos if the weather was n't a little wariable there would n't be no wariety in some folk's conversation."

A DANBURY man has a Boston lady visiting him. Sunday evening, on coming out of church with her, he extended his arm, and, with a delicate deference to her prejudices, said! "Will you accept my upper limb?" With a gratefui look from her glassy eyes she accepted.

A YOUNG lady artist married a young gentleman artist. The uncle of the bride made a call upon them and found them sitting in opposite corners of their joint studio, in the sulks, the husband saying that his wife's waist was out of proportion, and the

Curious Idol Worship in China.

THE PECULIAR CEREMONIAL BY WHICH EVIL SPIRITS ARE CAST OUT.

HANGCHOW, CHINA.—A curious display of idol worship is being nightly enacted not far from this city. It is not easy to determine to what sect it belongs, for, though held in a Taoist temple, no priest of either that or any other takes part in the ceremony. It is entirely carried out by the people themselves, and being in the seventh moon, when the names of the departed receive so much attention from their living relations, it may be correct to consider it a part of ancestral worship. At the beginning of the moon proclamations were posted all over the city announcing the commencement of this strange ceremony, and calling on the people to come up and pay their taxes or duties to Yuh-whang Shung-ti, "lord of the world and savior of men," as they do to their earthly Emperor. Each night, from the 1st to the 15th of the seventh moon, this panody on loyalty is carried out, and delegates from various districts bring strings of paper sycee, which is weighed with the greatest care as if it were real silver, entered into the account books of an official, and at the proper time in the ceremony is sent up to the spirits, through fire. An idea of the quantity of paper money consumed may be formed from the price received for the ashes, which realizes a total for this half month at 16 cash an oz. or not less than $30.

The real business of the evening commences after dusk: The procession, which goes out of the village in order to return escorting the spirit of the Emperor, begins to form. Each man carries a lantern, with the name of his district or society painted on it. The main temple and all the lesser ones are brilliantly lighted up with rows of lantern of red cloth, and some place large reflectors behind candles, the effect of which is very pleasing. Theatrical dresses of the most gorgeous colours, and heavy with gold lace, pass along in groups; boys dressed in red cloth and gold tinsel hats, men bearing swords, and battle axes, and bands of musicians go to make up this unique procession. The centre of all is the Emperor's chair, carried by twelve bearers, containing his tablet; a man on each side, carrying large white feather fans, shield it from the public gaze, but waving to and fro as if fanning a living person.

After a long interval, the big chair gave forth a booming sound, and the great idol Yuh-whang Shung-ti, wearing a most gorgeous dress, appeared and was placed on a raised platform under a rich canopy. All immediately fell prostrate on the ground, and, for a while, silence reigned supreme; presently the master of ceremonies took his place, and the bearers of cards of those gods who, by their rank, are allowed to pay their respects to his Majesty (as officials are with the real Emperor) began to arrive. A few feet from the throne they knelt and respectfully presented their card, which was received by an official, who announced, in a loud voice, the name and rank of the sender, the court musicians playing on their instruments on the arrival of each fresh card, of which, that night, there were forty-eight.

A few devout worshippers were allowed to prostrate themselves in the royal presence, and toward midnight his Majesty proceeded to judge the evil spirits.

The Chinese consider all mad persons possessed by a demon, and their friends, in the hope that this will be cast out by the ordeal through which they have to pass at this court, gladly send them there, each patient paying $55. These unfortunates are locked up in the hall before mentioned as the arrive—sufficient in itself to almost upset the balance of a sound mind. An official approaches and reverently asks for the keys. The request is granted, and runners ordered to bring one of the evil spirits to be judged. They rush off with a yell to obey this order, and presently they are to be seen at the far end hurrying along one of these unfortunate people. In the midst of frightful yells, the flames of the immense pile of paper money making the whole court as light as day, this poor wretch is brought into his Majesty's presence. He was a tall, powerful man, his face pale through passive; but if his acts gave any clue to the state of his mind he was the only sensible person there, for he refused to kneel! The excitement became intense. The runners threw themselves upon him with fierce energy to force him to kneel, but he was strong enough to resist them all, and after a fruitless struggle he was hustled out of this brilliant scene, and again thrust into the dark infernal regions. Another was brought forth with the same demoniacal yells. He quietly knelt, and was at length pronounced guilty, and sentenced to be beaten on the ankles with the light bamboo. A straw figure was brought forth to represent him, and he was obliged to look on while it received the punishment.

Spanish Murders and Brigandage.

(Saturday Review.)

In Spain there is not much actual murder, but there is a rampant brigandage, which only stops short of murder provided it can rob without it. Even in Madrid itself, in one of the finest and most frequented streets, a member of the Senate was, only two years ago, kept a prisoner in his own bedroom and threatened with death until he paid the ransom demanded of him. Bands of robbers, as is only too well known, haunt the mountain districts even in the neighbourhood of the capital. The brigands are said to have friends in very high places. They exercise a terror which prevents quiet people from daring to give evidence against them; they walk out of prison if they are put into it; and when they hold land they pay to the Government just the amount of taxes that they think convenient. Justice again is slow in most countries, but in Spain it scarcely moves at all. Every process is secret, and everything is carried on in writing. The pile of papers heaped up in reference to the murder of Gen. Prim ten years ago mounts up and up; but it is not even yet thought high enough, and a trial seems as far off as ever. The Goverment is as unable as any one else to insure a speedy conviction, and if it really wants to get rid of notorious criminals, it shoots them on the pretext that they are trying to escape. In minor matters there is the same inevitable delay, and in 1879 the official Gazette announced that a witness was wanted in reference to a railway accident that had occurred in 1864. Every Administration, too, invents new rules, and wants things to be done in its own style, and, whenever proceedings have been pushed forward a stage, compliance with some new regulation is exacted, and the matter is, and always remains, just where it was. As a last resource forgery is called in, on the chance that it may expedite the course of business when nothing else will. Next to robbery with violence, forgery appears to be the favorite failing of the nation. Even brigands forge, so that they may show themselves as good and civilized as their neighbors. Not long ago in one of the principal ports of the Mediterranean a cargo was got through the Custom-house duty free by means of a whole set of documents forged in the Custom-house itself. And so notorious and so general is the practice, that when it appeared that forgeries of coupons of the State debt had been made actually in the office where the debt is supposed to be controlled, the Minister of Finance mildly replied to questioners in the Chamber, that in a country where coin, bank-notes, and every kind of private document were habitually imitated, no one could wonder that the same ingenuity should be employed in forging state coupons.

NECESSITY is the mother of invention, and a newly-married Philadelphia man is experimenting with an electrical apparatus by which a party on an upper floor can light the fire in the kitchen without coming down stairs or getting out of bed.

A FRISKY old widow, by the name of Butler, who had been married several times, usually with disastrous results to her husbands, having obtained a divorce from her last husband, who was a Republican, immediately married a new husband, who was a rising young man and a Democrat. The friends of the widow congratulated her upon the acquisition of a new husband. The widow blushed violently, and, chewing the seam of her apron, replied: "Why, he is not a new husband at all. He is the same one I used to have before the war."

IT is absolutely necessary to look carefully after the education of your boys. They are apt to get wrong notions into their heads, and unless watched to make use of them to their detriment. A Sunday school teacher was examining her class on the parable of the wheat and tares. "And what is a tare?" she asked impressively. "I know," said a little fellow, who had watched his parent's course to some purpose, "it is a high old time; that's what it is." When asked by the astonished teacher to explain himself he said, "Last week father was gone three days, and I know just where he went and what he did, and the mother told me that the guv'nor was off on an old-fashioned tear."

MARKET REPORTS

CANADA LUMBERMAN OFFICE,
TORONTO, 13th Dec. 1880.

There is no change of consequence to note in regard to the local prices of lumber; the tendency however, is firmer. Navigation finally closed for the season on Monday, the 6th inst., by Messrs Christie, Kerr & Co., clearing the *Mary Grover*, with a mixed cargo of shingles, boards, and timber, for Charlottee, where the vessel arrived safely on Tuesday, and will remain moored during the winter. The high winds during the early part of last week broke the ice on Toronto Bay, but it closed towards the end of the week. The sudden closing of navigation leaves on the Toronto dock and along the line of the Northern Railway, nearly two million feet of lumber and a large quantity of shingles, which would have been shipped before this time; however, much of them will be moved by rail westwards and south before spring. Several car loads of hard wood arrived from the States by rail last week. Reports from lumbermen's camps are that work is going on briskly with plenty of snow. Local prices of lumber in the western cities and towns of Canada also show signs of greater firmness, and the demand keeps good. Manufacturers of all classes have orders on hand which will keep them busy to complete until the spring opens. There is a tendency amongst dealers to work less on the credit system than formerly, which is a move in the right direction.

SAVE YOUR COAL

J. W. ELLIOT'S PATENT SAVER.

The First Object—Is to produce the greatest amount of heat from a given amount of fuel, and is gained by an arrangement of the three way draft passage and some twelve feet of flue pipe, which is bent down and around the base, and the heat is absorbed by the atmosphere through direct radiation from every part of the stove. Another object of the invention is to secure for heating purposes the greatest possible benefit of the fire contained in the stove, and a accomplished by placing around the body of the stove if series of internally projecting pockets overlapping the fire pot, and so formed that the air of the room is admitted into the lower end of the pockets, and, after passing through them, re-enters the room, having become intensely heated through contact with the inner sides of the said pockets, which are immediately over the hottest part of the fire, thereby producing far greater results from a given amount of fuel than any other stove. *Second Object*—An evaporator which is a part of the stove. The cover becomes a water tank, and is an effective evaporater; the pivot on which it turns is an iron tube screwed into the base of the tank, while the lower end is closed and rests in a pocket inside the dome, thereby producing a greater or less amount of vapor in proportion to the intensity of the heat. *Third Object*—There is a double heater, by means of which heat can be conveyed to an apartment above, and supplied with sufficient vapor from the tank. *Fourth Object*—A combined hot air and steam bath can be obtained by closing the damper in the water tank, and causing all the vapor to mingle with the ascending heat. *Fifth Object*—

The Stove becomes Simplified and easy to Control

All hinged doors and objectionable fittings are abandoned, and are replaced by mica lights with metal tips attached, by means of which the mica may be sprung into place, or removed and cleaned with a dry cloth, or replaced when the stove is red hot, without burning one's fingers At the base of the mica lights eyelets are placed, through which a constant flow of air causes all the gas or smoke to be consumed or to pass off. *Sixth Object*—A base plate of cast iron in the place of zinc or other perishable material. The base plate is raised sufficient for the cold air on the floor to pass up through its raised and hollow cone-shape to the stove, and is rarified, and by this means a constant circulation is continued until an even summer heat is obtained. The circulation above described causes the floor to remain cool underneath the stove. The stoves are altogether cast iron; and the slow consumption of fuel, the direct radiation from all its heated surface, ensures them to last any number of years and to produce no clinkers or waste.

There are two grates, similar in form to the base of a circular basket; the centre grate is rotated to the right or left by the lever a short distance, and by moving the lever still further to the right or left both grates are worked.

To light a fire close all the drafts in the base of the stove open a direct draft in the smoke flue; fill up to the base a the feeder with fine coal, leaving sufficient space for draft, on the coal place the lightwood, leave the tank cover off slightly for draft, until the fire has taken, close the tank cover and open the draft in front.

A Turkish Wedding.

THE ELABORATE CELEBRATION CUSTOMARY WHEN YOUNG PEOPLE OF QUALITY ARE UNITED IN THE LAND OF THE CRESCENT.

A very pretty and more than pretty picture of a Turkish wedding comes to us from a gentleman living in the village of Selonik, the ancient Salonica, where Jews, Wallachs, Turks, Greeks, and Albanians now dwell together in amity. Aside from the Balram which follows the Ramadan, or month of fasting, and the Kurban-Balram, the Turk knows but one great festival—that of his marriage. For the rest, his life is occupied with his business and family affairs, and even on Friday he has but to go through his devotions in the mosque after which he returns again to worldly things. Even the two great festivals mentioned have, for the most part, lost their interest in the larger cities, and is is only in the provinces that the old manners and customs still prevail, and how pleasant and patriarchial in some of its phases the old marriage festival is told in the account of this correspondent.

He was invited to the wedding of Ali Nisa Bey, the son of his friend Mahmud Bey, a man of the highest consideration and respect, and known through all the neighbouring districts, and consequently the festival was to be more brilliant than usual, and was looked upon as a matter beside which all other events were but as the light dust of the balance. No less than three score guests had been invited to the house of Mahmud Bey at Kawadar, the seat of the aristocracy of Kikwesch. Having at length arrived at this place, all, in company with Mahmud Bey, betook themselves to the house of Feta Bey, the father of the chosen bride, where they met about fifty other guests, among whom was the Chief Imaun of the city. After salutations had been exchanged and they had partaken of coffee, there entered two persons, each accompanied by two witnesses; the first announced himself as the representative of the bridegroom, and the second as the representative of the bride, and, presenting their witnesses expressed the desire of their principals to be united in marriage.

Then the Imaun inquired of him who represented the bride, "Hast thou given Hairije Hanum, the daughter of Feta Bey, to wife unto Ali Nisa Bey, the son of Manmud Bey?" and thrice was made answer, "I have given her;" and so also was it with him who represented the bridegroom. Then Imaun arose and said: "By the virtue of my office in the presence of all these witnesses, I declare the marriage of Ali Nisa Bey, and Hairije Hanum." He then prayed and the marriage was finished. The guests then left the room, and as each passed the door he invoked good fortune upon the house. On the following day the feast began which was to last through two weeks. A donvet teskeressl (note of invitation) was sent abroad to many people saying that on certain days they were welcome to share the hospitality of the great family of Mahmud Bey. These invitations were each soon followed by a present to the invited guests of a sheep, an ox, or a cow. The last two days of the festival were reserved exclusively for the trusted friends and relatives of the family. There were wrestling matches between herculean athletes dressed as to their nether parts in tight fitting leather breeches, but with their upper parts bared and oiled. Each smote his hands, slapped his knees, and the two sprang round each other ever watchful for a favourable opportunity to grapple. Round and round they went till at last one suddenly sprang upon his opponent and a lively struggle ensued, neither succeeding in throwing the other. They separated and rappled again, trying every trick save tripping; they fell on their knees and on their breasts, but it was only when one had thrown the other and held his shoulders on the ground that it was considered a good fall, the victor receiving a universal "afferim" or bravo from the spectators. In the second round the antagonists clapped their hands and sprang round each other for a full hour before they came to close quarters, and one, catching the other by the right leg, lifted him off his feet, and this also was looked upon as a winning of the bout and was greeted with the afferim. The defeated athlete then made a low reverence to his conqueror, who extended to him his hand and then embraced him. The prize was an ox, and after it had been awarded, the two wrestlers passed through the crowd and received gratuities which were afterwards equally divided between them. In the evening the party returned to the house, where Mahmud Bey entertained them, and they made themselves comfortable on couches, smoking chibouks and drinking raki, a liquor made with anise which the Turks drink before partaking of the evening meal. The entertainment was varied with music, the orchestra consisting of two violins, a clarionet, a tambourine, a small drum, and, above all, a "canun"—an instrument resembling the zither, only larger. In honour of the Frankish guest, Italian and French music was at first played, but after a most unearthly fashion, out of all time and tune. At the request of the Frank, some Scharki and Makams (Persian and Arabian) pieces were performed which, in spite of their seeming monotony, were still intoned with a peculiarly charming melody, and were played much better than the French and Italian music. Then came the time to see an Arab dance. Two Gypsy girls dressed in sort, bright coloured garments entered the room and began to move, slowly at first and gently, and then in a *tempo staccato*, till this became quicker and quicker and ended in a bewildering whirl. The steps were a companied with all possible graceful movements of the body and the music was marked with the striking together of thimbles, one on the thumb and one on the middle finger and used as castanets. As tedia ce grew wilder and wilder and the girls grew into Mænads, many a "Mashallah!" and many an "Afferim" was breathed out by the enraptured company. As it drew near midnight two servants appeared with silvered yataghans and richly mounted pistols in their girdles, one bearing napkins shot through with gold and silver threads, and the other a ewer and basin, both of solid silver, and poured water on the hands of the guests. Then a low tripod was placed in the centre of the room and on it a large copper salver, on the rim of which were bits of bread and delicately carved wooden spoons, while in the centre a dish containing tschorda (soup), into which had been poured, after the Turkish fashion, eggs beaten with vinegar. Around this board the guests sat cross-legged, the host courteously bade them "bujurun"—to command him—and then they fell to, dipping the bread in the soup. After the soup came a baked lamb, stuffed, a pudding, a potpourri of meats, baked meat again, several ragouts with hashed meat, boiled pulse, the whole ending with a rice pudding. Then all arose, washed their hands—first time with soap—and partook of coffee, followed by some pleasant eat, and then to bed. In the morning they were awakened by music beneath their windows, and two hours afterward they went to see the outset of the bride. The linen clothes, and other household stuff of the bride had come, borne by twelve heavy-laden horses. Six men carried the copper and silver vessels of the bride on trays, some of silver and some of copper. The procession—and how this reminds one of Aladdin!—bearing the marriage portion, left the bride's house, passed up the two principal streets and then reached the house of the bridegroom. The portion itself might have been taken for an oriental bazaar *in petto*. May the marriage be blessed. Inschallah!

The Natural Hstiory of Dress

The pleasure derived from wearing attractive garments can not be identified by the title of a purely æsthetic enjoyment. It is the monopoly of the individual who thus adorns himself; and the pleasures of art, properly so called, are above all monopoly. The impulse must, one supposes, from the day when primitive man began to paint his body or adorn his head with feathers, have led to a constant variation in his style of apparel. It is of the nature of the passion to be insatiable in its craving for change and novelty. We look for an element of novelty even in a work of purely impersonal art, and in the personal art of self adornment this demand is omnipotent. Hence what answers to spontaneous variation in the region of dress, would commonly be the outcome of this restless desire to look finer than one's neighbor's. In this way the feeling for the ornamental side of dress has subserved the development of it as a utility. Changes introduced by individual fancy and the love of the novel and striking, would be permanently adopted when found to bring some advantage, as, for example, increase of warmth. It may, indeed, be said that the growth of dress in mere volume and number of distinct parts has been greatly promoted in the first instance by this impulse of self adornment. The rude love of beauty shows itself in an admiration of mere quantity; and the men and women who managed to amplify their garments would clearly by so doing attain a richer decorative effect.

WERE the Centaures any immediate kin to the half tribe of Manss-eh?

REID & CO., WHOLESALE LUMBER DEALERS. Lumber, lath, shingles, & car lots to suit customers. Best culls in the market from $6 to $7 per M.

NET ASSETS, JAN. 1, 1879 **$23,761,342.** **ÆTNA LIFE** INT'REST RECEIVED, 1879 **$1,856,710.**

RATE PER CENT., 7.81

That the above is a most satisfactory and profitable rate of interest will be conceded by all. But the careful attention paid to this, as to every other department, by the Directors of the **ÆTNA LIFE INSURANCE COMPANY**, will be more apparent when viewed in the light of the following figures, found in the latest published reports of 3 American, 3 British, and 3 Canadian Life Insurance Companies:—

NAME.	ASSETS.	INTEREST.	RATE.
Equitable, New York	$54,195,368	$1,950,680	5.70
Union Mutual	6,874,249	344,591	5.01
New York Life	35,630,567	2,021,887	5.67
London and Lancashire	851,720	37,325	4.38
Reliance, of London	2,379 410	109,720	4 61
Standard, of Edinburgh	25,939,635	1,120,255	4.31
Canada Life	3,070,988	199,504	6 49
Sun Mutual, Montreal	319,178	21,774	6.82
Mutual, Hamilton	88,068	4,684	5.26
Average	$12,149,797	$644,436	5.35
ÆTNA LIFE,	$23,761,342	$1,856,710	7.81
5 35 per cent. upon $23,761,342 is only		$1,271,131	

Upwards of **$585,000** was therefore realized in 1879 by the ÆTNA'S management from its **$23,761,342** over and above the average of the nine Companies. This is a point of great importance to persons desiring to insure their lives on the "WITH PROFITS" plan. ☞All the profits in the **ÆTNA'S** Mutual Department belong to the Policyholders.

Receiving, as above shewn, a more profitable rate of interest on its funds, and also transacting its large business at a great saving in general expenses, compared with others, this Company is able to offer the public more favorable rates, as may be seen from the following examples. The three endowment columns show the premiums at 40 years of age:

$1000.

NAMES OF COMPANIES.	*Endowments, with Profits, at Death, or the end of* 10 Y'RS.	15 Y'RS.	20 Y'RS.	*Death only, without Profits.* AGE 30.	AGE 40.	AGE 60
Canada Life	$110.40	$68.80	$50 30	$18.20	$25.90	$64.30
Citizens', Montreal	103.70	69.60	53.40	19.20	26.20	63.60
Confederation	104.65	68.70	50.05	19.08	26.04	62.76
Mutual, Hamilton	104.50	68.70	50.00	.....	.....	.....
Sun, of Montreal	106 90	69 40	51.70	16.90	24.60	63.90
Equitable of New York	106.90	69.49	51.78	.....	.....	.....
Union Mutual	106.90	69.49	51.78	.....	.....	.....
London & Lancashire	106.85	69.92	51.56	18.89	25.05	63.58
Star	.....	70.64	52.60	22.92	30.49	67.91
Standard	.....	.....	51.97	20.87	28.15	65.96
Average Premium	106.35	69.41	51.50	19.51	26.63	64.58
ÆTNA LIFE	97.43	61.46	48.77	17.20	24.37	61.98
ANNUAL DIFFERENCE	8.92	4.95	2.73	2.31	2.26	2.60

Besides this important difference in the rates (which is of itself a large dividend—"a bird in the hand") the **ÆTNA** makes a liberal cash dividend every year in reduction of the above profit rates, making in most cases a very much larger difference than here shewn.

WM. H. ORR, Manager.

NATIONAL MANUFACTURING CO.,

202 SPARKS STREET, OTTAWA.

Manufacturers of tents for Lumbermen, Sportsmen, Camp meetings, Photographers, Lawn and Military encampments, with or without extra extra roofs, all sizes and styles, white or fancy striped, mildew proof or plain. Warranted not to Gum.

STOCK'S EXTRA MACHINE OIL.

STOCK OLEVINE
Equals Castor Oil, and
Warranted not to Gum.

It will give the subscriber much pleasure to forward, post free, to any address, on application, pamphlet, containing instructions and information that have been found of the greatest practical use to dealers and consumers of machinery oil in Canada. It contains the fullest information as to the different kinds of oils, their qualities and uses, thus enabling the consumer to make choice of the very oil best adapted to his wants, and also enables the merchant to select the kinds most likely to be in demand in his neighborhood. This pamphlet shows conclusively that oils properly manufactured from petroleum, are vastly superior to any *animal* or *vegetable* oil. I am now making the same qualities of "Extra" and "XX" oils I manufactured from 1870 to 1873. They are *guaranteed not to thicken with extreme cold*, and warranted to give satisfaction in every particular. Beware of Agents soliciting your orders without my trade-marked order-book. Address

SAVE THE TREES.

Whatever opinion may be held by the owners of the timber lands regarding the nearness of the exhaustion of the supply of pine and other available building timber, it cannot be a question says the *Lumberman's Gazette* with any intellectual person that it would be well if the woodsman's vandal axe were stayed against every promising Norway, hemlock or whitewood tree which may now be regarded as of no merchantable value. It may be said, these trees are of no use for the manufacture of lumber, and this may be true when compared with our more desirable pine. But it is nevertheless true that they may be made available for many of the purposes for which white pine is now used. Norway is coming into use to a great extent for bridge timber and bill stuff, but not to the extent which it might be made available. While it is not so easily worked as white pine it is quite as enduring and in moist situations probably more so, being highly impregnated with pitch. For timbers, joist and scantling, there can be no objection to it, while its use for these purposes would conserve so much pine which is more available for other uses. Norway has been used for finishing lumber and presents a pleasing effect when finished in oil, the grain making it quite ornamental. Hemlock may be used for the same purposes as Norway pine, except it cannot be so freely exposed to moisture. Indeed it requires to be kept dry in order to secure its greatest durability. While not useful as a finishing lumber or available in so many situations as pine, there are many uses to which hemlock can be put where it would answer the same purpose. For beams, joists and sills, roofing boards, sheathing boards, rough fencing, and the like, it would be found an admirable substitute, since its limited adaptability would necessarily make it cheaper than pine. It is a strong durable wood, and we have seen it made into very good lumber. There is a vast deal of it still in Michigan, but it is going the way of the pine, only in a more vandalish way. The timber is being sacrificed for the bark, which is stripped from the tree for tanning purposes and the trunk left to rot upon the ground. Whitewood is quite a desirable timber, but it is not very plentiful in the northwest. In the south it is abundant and known—in some parts, at least—as poplar, and is as highly esteemed. There is some of it in Michigan. If the lugubrious prognostications regarding the near approach of the total destruction of "our" forests be well founded, even the apparently worthless-for-any-purpose-except-to-swindle-wood-buyers basswood may some day have a value as a lumber yielding woold —providing any of it is left standing after the pine has disappeared. If the present generation cannot be brought down to the use of any of the woods we have referred to, but must have the very finest grades of timber now growing in the forests, regardless of posterity, it would be only just to the future generations that the conservative policy be adopted towards the coarser products of the forest, to the end that our children's children may have a chance to shin around among them and put them where they will do more good than being added to the soil by rotting, or the atmosphere by burning. At the present rate of demolition it is certain the woods will not always be with us, and it were better to treat them so that we shall not be quite consumed by remorse when they shall disappear. It will be a sufficient source of grief that we can coin their stalwart trunks into ducats no more.

To the above, the *Northwestern Lumberman* replies, and states that while the article contains many suggestions which in their elementary character are useful and truthful, is yet laden with so many errors and misstatements as to be deserving of severe criticism, coming as it does from a journal which is publicly supposed to speak intelligently upon subjects pertaining to the timber supply of the country. Its assertion that Norway, hemlock and whitewood have no merchantable value and are of no use for the the manufacture of lumber, will strike the average lumberman with surprise, especially those east and west of the Saginaw Valley. Of the 1,608,000 feet of lumber constituting the receipts of the past season at Chicago, we believe we underestimate when we assert that fully one-fifth, or 300,000,000 feet was Norway, which while not a prime favourite like white pine is still recognized as a prominent and indispensable article in the lumber trade, bearing a price but a trifle below that of white pine. Again the *Gazette* is in error in asserting that Norway is quite as enduring as white pine in *moist* situations. Exactly the reverse of this proposition is the truth. Norway is of little or no value except when perfectly dry, or else perfectly submerged. Moisture is a deadlier enemy to Norway than to white pine. For joist it is excellent and durable because in this position it is kept dry, but a Norway sill is avoided by every builder when any other material can be obtained, except when it is to be placed in a position where it has a perfect circulation of air around it. As bridge timber it is avoided, and is seldom used where a thickness of over six inches is desired, from its liability to dry rot when used as timber. Hemlock will stand more moisture than Norway pine which is the most liable to decay of any of the *coniferous* varieties of timber. The assertion that hemlock has no merchantable value will probably be read with surprise by the lumber dealers and manufacturers of Maine, Massachusetts and Pennsylvania, the former of whom manufacture in the ratio of 17 per cent. of hemlock to 80 per cent. of spruce and three per cent of pine. Hemlock is among the standard quotations of the Boston market at from $11 to $13 50, with spruce at $13 to $17, and coarse grades of pine at $12 to $18. Hemlock has to but a small extent as yet been utilized in the West. but this is simply because of a prejudice, induced by the greater plentifulness of white pine and its low value, combined with its quality of being graded and thus yielding a larger measure of profit, while hemlock costing equally as much to manufacture, presents no chance fat "pickings" or speculative grades, If in this sense the *Gazette* refers to it as having no merchantable value it is measurably correct. Whitewood, in some sections termed poplar, is one of the most plentiful in the supply of timber woods of the Southwestern and Middle States, and one of the most valuable woods of local commerce. It is true that but little is found in the North, but it is held at a value equal to the best pine. The *Gazette* has but to scan its own pages of pine quotations to learn that in Albany, Philadelphia and Boston, whitewood or poplar ranks in value with ash, oak, maple and hickory.

The most astounding statement which the *Gazette* makes however, is in its allusions to "even the apparently worthless-for-any-purpose - except - to-swindle - wood-buyers bass wood" which it asserts "may some day have a value as a lumber yielding wood." The demand throughout the United States today for this "worthless for any purpose" timber, so far exceeds the supply, that dealers are hunting for it in every direction. The wants columns of the LUMBERMAN have carried an advertisement of one Chicago firm for the past six weeks or more, soliciting parties who can supply it to make themselves known. In the city of Chicago alone probably 10,000,000 feet per year would be taken if it could be had. It is extensively used by the furniture manufacturers, it is an indispensable wood in carriage making and sleigh manufacture, and the sewing machine case manufacturers of this country would be glad to day to contract for 100,000,000 feet of this "worthless for any purpose" timber, and would not need much urging to double the order. The market value of this "worthless for any purpose" timber is today in Chicago from $20 to $30. Boston quotes it at 25 to 27, with § at $20 to $22. Albany $20 to $25. Milwaukee $20 to $30, in the light of which figures the assertion of "worthlessness" seems anomalous.

The *Gazette* is in error in characterizing either of the woods named as worthless or possessing no marketable value. Fortunes are quietly being worked out of all of them and the aggregate trade in each, even in the Northwest is something enormous. Even the despised black ash, formerly considered of value only when the straight grain of a central section of the trunk enabled it to be split into hoops, has of late years taken a high position as an ornamental wood, and we are aware of at least one veneer mill now being erected in the Northwest which will make a business of supplying black ash veneers. The libraries of the Cornell University are fitted up with black ash, a goodly portion of which was cut in the swamps of Bay county, Michigan, for the late John McCraw, whose liberality has done so much for the University.

HOW TO BE A SUCCESSFUL SAWYER.

The aim of every workman should be toward superiority in his particular employment. To reach this point experience is of course of the greatest value and absolutely the best teacher. Nevertheless certain rules may be stated, the following of which will greatly assist the aspirant after success in his calling. Other things being equal, a sawyer may reasonably hope to attain to superiority by observing the following directions: 1. Acquire sufficient knowledge of machinery to keep a mill in good repair. Remember that if a knowledge of machinery is a good acquirement one cannot have too much of it. 2. See that both the machinery and saws are in good order. A man cannot do the best work when he is in ill-health, neither can machinery do the best work when it is in ill-repair. 3. Bear in mind it does not follow because one saw will work well that another will do the same on the same mandrel, or that even two saws will hang alike on the same mandrel. On the principle that no two clocks can be made that will tick alike, no two saws can be made that will run alike. 4. It is not well to file all the teeth of circular saws from the same side of the saw, especially if each alternate tooth is bent for the set, but file one-half the teeth from one side of the saw, and of the teeth that are bent from you, so as to leave them on a slight bevel and the outer corner a little the longest. 5, Never file a saw to too sharp or acute angles under the teeth, but on circular lines, as all saws are liable to crack from sharp corners. 6. See that each tooth will do a proportional part of the work, or if a reciprocating saw, keep the cutting points pointed on a straight edge. 7. Keep the teeth of your saws so that they will be widest at the very points of the teeth, otherwise the saws will not work satisfactorily, the tendency of all saws being to wear narrowest at the extreme points. 8. The teeth of all saws should be kept as near a uniform shape and distance apart as possible, in order to keep a circular saw in balance and in condition for cutting.

LA BANQUE NATIONALE.—In the LUMBERMAN of the 15th inst. the name of La Banque Nationale appears in the list of timber manufacturers. We are informed that the Bank is not manufacturing timber on its own account, although like similar institutions it has advanced funds to a few lumbermen.

OUR HERO IN BLACK.

We always spoke of ourselves as a "garrison town," we good folks of Donjonville. And why should we not? Had we not barracks and a company of Foot, and, more than all, a Government chapel and a Government chaplain? What more would you have to constitute a garrison town? We had no fortifications, it is true—nothing, in fact, that, strictly speaking, could be garrisoned—but then we had our noble and massive old castle, with its walls nine feet thick, which had stood a siege of six months by Robert Bruce, and a bombardment of six minutes (two shells did the business) by one of Cromwell's generals. We swore by that castle, we swelled with conscious pride as we spoke of it; and a cynical tourist, who was overheard to describe it as "a gray squat building," narrowly escaped being lynched upon the spot. This ancient fortress had, indeed, degenerated into a common gaol, a fact which somewhat detracted from the romance of its associations; but, despite the painful penitentiary cleaniness and order of its interior, there was still a fine old fendal look about portions of its exterior, and we Donjonvillites could, at any rate, boast that there was not in the three kingdoms any castle of its age in such perfect preservation.

We were a trifle dull, perhaps, at Donjonville—prejudiced persons from neighbouring towns, envious of our historical prestige, sometimes pronounced us stagnant; indeed, a distinguished novelist, who once honoured us with a flying visit, afterwards described Donjonville as "probably the dullest spot on the habitable globe." But, then, how could he possibly be able to judge from seeing Donjonville for a few hours on a miserably wet day; and what weight, after all, does any sensible person attach to the flippant utterances of a shallow scribbler? Not, mind you, that we were not sometimes conscious ourselves of being dull, and at such times we were wont to execrate the dulness of Donjonville with singular unanimity and forcibleness of expression. But then it was one thing to pass unfavourable criticisms upon Donjonville ourselves, and quite another to tolerate such strictures from strangers. On the whole, a pretty wide experience of English provincial towns inclines me to think that Donjonville was, after all, not so dull as many places which make far greater pretensions to liveliness.

We rejoiced of course in a plethora of gossip, for you will generally find that the smaller the town the bigger the gossip; and we had an admirable assortment of gossip-mongers of both sexes, the male element, however, being, I am bound to say, the preponderating one. We had an American "colonel," a retired sea-captain, and a militia major, whom I would have backed both as retailers and inventors of scandal against any three in the world. But rich as we were in accomplished gadabouts, we were even richer in original "characters," whose eccentricities kept us constantly provided with entertainment. Foremost among these, by right of his individuality not less than by right of his social position, stood our Government chaplain, who was also practically the vicar of Donjonville, their being no other "Established" place of worship within a mile of the town. The Rev. Joseph Stickler—"the last of the Sticklers," as he used, half-proudly, half-pathetically, to style himself, for he was a widower, and his only son had been killed at sea—was a remarkable man in many ways. In height he was not more than five feet three inches, but in girth his proportions were gigantic. I have never seen so short a man carry the middle button of his waistcoat in anything like such an advanced position as Joseph Stickler carried his. His knees had been hidden from his sight for years. He had a leg—or I should say two legs, for he possessed the normal complement—of perfect shape. If Mr. Stickler had any mundane vanity, and even the best of men are not without it, his legs were the object of that vanity. It was because he was just a little vain of them, I suspect, that he clung to the good old fashion of knee-breeches, black-silk stockings, and buckled shoes long after the rest of the civilized world had discarded those integuments, though probably, if all the leaders of fashion had possessed such elegant extremities as our Government chaplain, the modern trouser would have been unknown. In deportment the Rev. Joseph Stickler could have given Mr. Turveydrop a lesson. He carried himself with such dignity, that when he stood talking on the parade with "Cunnle" Hiram B. Fulton, a lanky "Down-Easter" of six feet three, the parson struck you as being by far the bigger man of the two. His florid clean-shaven face would have been handsome had it been a trifle less fleshy; and, at any rate, no one could deny that it was a good resolute English face, full of courage and sense.

So much for the Rev. Joseph Stickler's physique. But his manners were even more remarkable than his figure. He had a blunt forcible way of calling a spade a spade, both in the pulpit and in private life, which often shocked persons burdened with a particularly squeamish sense of propriety. I heard him once put an extinguisher upon an affected and foolish lady, who was expatiating on the virtues of the son whom she had just sent to school, by blurting out gruffly and brusquely.

"Humbug, madam, humbug! There never was a boy yet who wasn't a thief and a liar. A good boy is a monstrosity, madam a *lusus naturæ*, sure to come to the gallows or some equally bad end. There's some hope of a bad boy: flog the vice out of him at school, and it's ten to one he'll turn out a decent man when he grows up."

So far you will say that there was not much that was heroic about Joseph Stickler; and possibly, had you "sat under him" and listened to his pulpit utterances, the sound common sense of which was constantly marred by his grotesque habit of stopping in the full flood of his discourse to remonstrate, in the homeliest fashion imaginable, with the drowsy or heedless members of his congregation, you would have probably found it still harder to see anything heroic in our eccentric parson. But for all that he *was* a hero, and this fact I am sure you will admit readily enough before you reach the end of my story. For, whatever Ouida and "Guy Livingstone" may try to persuade you to the contrary, a hero need not by any means be a giant in height and a Hercules in strength, with Norman brow and Grecian nose; indeed, I take it that there have been far more heroes under five feet six inches than over that standard, and far more snub-noses among them than even Roman ones. However, to come back to our muttons, you shall hear why and how Joseph Stickler came to be considered a hero. It was with the younger male portion of the community that he first established his claim to that title, and the manner of it was remarkable.

I have already mentioned our parson's propensity to administer homely, but at the same time fearfully impressive, rebukes to those of his congregation whose conduct seemed to him indecorous during divine service. The most frequent recipients of this verbal chastisement were the unhappy Sunday-school children, whose horribly uncomfortable pens—I cannot call them seats—were immediately facing the pulpit. But the punishment of these unfortunates was not confined to words. The Rev. Joseph Stickler had a sturdy henchman who was as vigorous a disciplinarian as his master, and a scarcely less original and eccentric character. Billy Marks—for such was the somewhat undignified name of this representative of Donjonville Bumbledom—filled a rather nondescript ecclesiastical position: before service he acted as verger, during prayers he acted as clerk, when the sermon commenced he vacated his desk and went aloft to the gallery, where, armed with a long cane, he stationed himself immediately behind the school-children. Heaven help the hapless boy or girl who dared to doze or exhibit the slightest symptoms of inattention during the preacher's discourse! Softly would the artful and lynx-eyed William creep along the cocoa-nut matting until he was within striking distance of his prey, and then the cane was cautiously raised, to descend upon the head or shoulders of the luckless victim with a thwack that sounded all over the building. And if the watchful Billy, whose attention to his master's homily must have been of a rather divided sort, failed to detect a delinquent, the stern voice from the pulpit, which he knew too well, would at once call his attention to the omission. It was on one of these occasions, when Billy was guilty of a dereliction of duty, that the first memorable exploit of our hero in black was achieved. The circumstances were these:

The offices of the "garrison," four in number, occupied a pew in the gallery not far from the *enfants terribles* who were Billy Marks's special charge during sermon-time. It was a warm day in summer, and, what with the heat and the sonorous eloquence of the preacher, there was a general disposition to drowsiness among the congregation which nothing but a strong sense of duty and the exercise of considerable self-control could overcome. Even the vigilant custodian of juvenile morals nodded at his post, and forgot that there was an eagle eye upon him. Suddenly the preacher paused, and, in a voice that had more of sorrow than of anger in it, called "Billy Marks!"

Up to his feet in an instant sprang Billy, conscious of his own backsliding, touched with remorse by the reproachful accents of his master, burning to atone for his fault by some extraordinary display of zeal. The first object which met the zealous and repentant William's eyes, as, confused and only half awake, he glared around him for a victim, was the head of a very young ensign who was peacefully slumbering in the corner of the officers' pew. Without pausing to think of the consequences, Billy brought his cane down, thwack! right upon the scone of the sleeping warrior. That gallant youth sprang instantly upright at the touch of this rude Ithuriel's spear, and gazed round him with a wild bewildered stare. On all sides he saw grinning faces—an audible titter ran through the schoolchildren—sounds suggestive of suppressed cachinnation came from behind pocket-handkerchiefs applied ostensibly to the normal use; the cheeks of his fellow officers were undistinguishable in colour from their uniforms, and their heads were bent in an attitude which could scarcely be accepted as devotional. A ghastly and horrible suspicion stole into the mind of the young ensign that *he* was the object of all this unseemly mirth, and that he had somehow, though he had not the faintest idea how, made himself supremely ridiculous. With crimson and perspiring countenance he sat as rigid as the tinted Venus for the remainder of the sermon, suffering all the agonies of a martyr at Smithfield. Whether the Rev. Joseph Stickler had perceived Billy Mark's mistake or not, no one could tell; he went on imperturbably with his sermon as if nothing had happened; but if he *had* thoroughly realized all that had happened, and I am inclined to suspect that he had, the control which he exercised over his nerves was of itself heroic, and worthy of an ancient Stoic or an Indian brave. Be this as it may, however, the sequel was a scene which none who witnessed it would ever forget.

The barracks were but a short distance from the chapel, both being situated in the imposing and spacious square which Donjonvillites spoke of proudly as "the parade," and which was pronounced by a Donjonville cabinet-maker, who had once visited London, to be far superior to even the world-famed Trafalgar-square. The officers had marched the "garrison" back to barracks, and had retired to their own quarters, before one half of the congregation had emerged from St. Mary's. In the privacy of their own apartments they at once began to "roast" their juvenile and verdant comrade. The senior captain, Spofforth, a portly florid man, who belied his appearance by being really "the coolest hand going," having closed the door, addressed the young ensign with great seriousness.

"You know, Sparkes," he said, "this is not the first time the regiment has been grossly insulted by the chaplain. This abominable outrage is simply the culminating point of a long series of deliberate insults. But now the thing must be promptly stopped. I must insist upon your demanding a public apology at once from Mr. Stickler."

"Ye-es," stammered Sparks, who was exceedingly angry still, and very red in the face, but didn't quite see how his senior's injunctions were to be carried out.

"You will oblige me and your brother officers, Sparkes, by meeting Mr. Stickler as he crosses the parade from the chapel to his house, and immediately demanding an ample apology on behalf of the regiment, which has been outraged in your person."

The recollection of that sounding thwack from Billy Mark's cane rushed into Ensign Sparkes's mind; his blood tingled at the thought of that monstrous indignity, and he answered firmly.

"You may trust me, Captain Spofforth. The dignity of the regiment shall not suffer in my hands. I will go at once and confront Mr. Stickler, and extract an apology from him on the spot."

Big with self-importance as the accredited champion of the regiment, Ensign Sparkes clapped on his shako fiercely, and strode out into the square to exact prompt reparation from the insulter.

Meanwhile, unconscious of all these machinations, the Rev. Joseph Stickler quietly disrobed himself in the vestry, and then proceeded to cross the parade to his house. Just as he was opposite the barrack-gates and in front of the barrack-windows, he became aware of a tall figure, in scarlet, approaching him with rapid steps. In another instant the Rev. Joseph found himself confronted by the insulted subaltern, who, with glaring eyes and flaming cheeks, addressed him thus:

"Sir, I have been most grossly insulted and assaulted by your orders. The whole regiment, sir, has been affronted in my person. I demand an apology!"

"A *what*!" exclaimed the chaplain, falling back, and surveying his interrogator with a look of supreme amazement.

"An apology, sir; an ample apology!" repeated young Sparks hotly.

"Young man," said the Rev. Joseph Stickler severely, "I don't know what this buffoonery means. If it were not so early in the day I should say that you were drunk, sir."

"What, sir!" exclaimed the enraged ensign; "you refuse to apologise—you dare to add to the insult by insinuating that I am not sober! Let me tell you, sir," assuming an air of bellicosity that might have awed even a bubbly-jock, "that if it were not for your cloth, sir, I would give you the d—dest thrashing you ever had in your life!"

The face of the "last of the Sticklers" grew black as thunder; lightning blazed from his eye; his whole body heaved with the volcano of indignation that raged within him. For an instant he seemed petrified, but only for an instant; then, with an agility quite extraordinary in a man of his obesity, he divested himself of his coat, planted his feet firmly and defiantly, and said, with grim irony.

"O, don't let my cloth for a moment interfere with your desire to inflict corporal chastisement. Proceed, sir; you are quite at liberty to thrash me, sir—if you can."

A peal of laughter bursts like a volley of musketry from the vicinity of the barracks. Sparkes glanced hurriedly around; there was the whole "garrison" crowded at the barrack-gates, convulsed with merriment, and there, in the windows of the officers' quarters, was—no, he must be mistaken—yes, a fact!—there was Spofforth himself, holding his sides while the tears ran down his purple face. Too late it flashed upon the unhappy Sparkes that he was both making a fool of himself, and being made a fool of. Sharply turning on his heel with a smothered anathema, which, like the parish-clerk's sweeping curse, seemed to include "all persons that on earth do dwell," Ensign Sparkes hurried back, a piteous spectacle of mingled shame, rage, and discomfiture. Whilst the Rev. Joseph Stickler, as he struggled back into his coat, was distinctly heard to ejaculate.

"Preposterous young puppy! Talk of thrashing me, indeed!"

And so, amid the ill-suppressed applause of the lookers-on, the parson strode, fuming and furious, to his house.

From that moment the Rev. Joseph Stickler was a hero in the eyes of the "garrison" and the youth of Donjonville. Staid and respectable middle-aged society shook its head, and declared that the chaplain had behaved in a most undignified manner, and had quite forgotten what was due to his cloth. I suppose these douce people were right, and that it would have exhausted even the resources of Turveydropian deportment to have carried off such a scene with dignity. But that was the only time that Joseph Stickler was ever known to allow his eccentricity to imperil his dignity; as a rule, the latter was invariably the accompaniment and correction of the former.

Middle-aged propriety, then, might be excused for failing to see anything heroic in conduct which had only won the irreverent admiration of persons addicted to taking a sporting view of even the gravest matters, but not the less among that class had the Rev. Joseph Stickler established himself as a hero. It was not long, however, before even the "unco guid" of Donjonville were compelled to admit that their respected and esteemed, though eccentric, parson was veritably and unmistakably a hero—of the sort which a delighted and sympathetic Sovereign is proud to decorate with the Victoria Cross or the Albert Medal. And this was the startling incident which suddenly revealed to Donjonville the fact that the black coat and knee-breeches of Joseph Stickler incased as brave a man as ever faced a battery or charged a square in all the glory and glitter of scarlet and gold.

On Christmas afternoon as the chaplain was passing the barrack-gates, he noticed that there was something unusual taking place in the courtyard. The soldiers were gathered in excited groups, and there was that indescribable air of agitation about them which is always noticable in a crowd when something tragic is astir. The Rev. Joseph Stickler walked in and inquired the cause of the commotion. He was told that one of the men, a wild fellow named Hennessy, had gone mad with the libations which

he had imbibed at the feastive season, had locked himself in the guard-room, armed himself with a loaded musket, and was threatening to shoot any one who approached him.

"Have you informed the officer on duty?" asked the chaplain.

"The officers, sir, are all away at a dinner-party."

"And where's the sergeant of the guard?"

"Here, sir."

"Well, sergeant, why don't you arrest this man at once and put him in irons?"

The sergeant looked sheepish as he replied,

"Why, you see, sir, it's not as it he was only drunk, but he's reg'lar ravin' mad with *delirium tremens;* he's got every musket in the rack loaded, and he's that desperate he'd pick three or four of us off before we could lay hands upon him. I dursn't chance it, sir."

The chaplain's face grew dour and black; there was a ringing resolute tone of command in his voice as he said,

"Fetch me a blacksmith at once. Tom Baynes is the best man; and tell him to bring his forehammer with him."

A messenger was despatched for the blacksmith. In the interval the chaplain calmly reconnoitred the guard-room, and the soldiers stood looking at him, their voices hushed into whispers, wondering what would come next and what the parson was about to do. They were not long kept in suspense. The messenger returned, bringing with him Tom Baynes the blacksmith, a big, gaunt, powerful man, black with the grime of the forge, girt with his leathern apron, his forehammer on his shoulder. Touching his forelock to the parson, Tom looked at him in some bewilderment. Motioning to the guard-room door, the chaplain moved forwards, saying,

"This way, Baynes."

When the door was reached the voice of the madman was heard within blaspheming horribly, and yelling threats of vengeance against every mother's son of them. The blacksmith paused, and his face lengthened. Here was a queer job; he didn't half like it. He scratched his head and began to reflect, but his reflections were cut short by the chaplain,

"Tom, I want you to break-in that door; a couple of blows will do it."

Tom Baynes hesitated. Then you should have seen our parson. Tom used to say afterwards that he never saw a man "grow so big all on a sudden like." Pointing to the door with a gesture and a tone which there was no disobeying, the chaplain said sternly,

"Baynes, smash-in that guard-room door this instant; and you, sergeant, have you picket ready to rush in and secure the man at once."

"Sergeant, do your duty; arrest that man at once!"

The barrel of Hennessy's musket was directed steadily at the sergeant's head; the sergeant felt uncomfortable, his cheek blanched, and he made a further strategic movement to the rear. The madman gave a fierce derisive yell that might have made any man's blood run cold to hear it.

"Now, you black-coated old devil-dodger, out of the way there, and let me have a clear shot at that sergeant! Out o' the way, I tell ye, or else I'il blow your head to pieces!"

"Sergeant," cried the chaplain, in a voice of thunder, "arrest that man at once!"

"Ha, ha!" roared Hennessy, "he knows better. The first man that passes that door I'll send to hell in quick time."

And in extenuation of the sergeant's backwardness it must be admitted that the fellow looked as if he meant to keep his word. He was a desperate, determined, and ferocious man at any time; but now that he was literally and uncontrollably mad with drink, he was capable of any crime.

"Am I to arrest this man myself, sergeant?" asked the chaplain, in a quiet firm vaice, very different from the angry tone of command he had used a moment before.

"Arrest me, parson! I'd like to see ye try it! If ye put a foot or a hand beyond that doorway, I'll shoot ye down like a dog! If ye don't clear out from where ye are before I count *three*, so help me, I'll fire!"

The parson paid no heed to the raving maniac, but with ineffable disgust and scorn and said to the sergeant,

"What! are you afraid, man? Why, then I suppose a black coat must show you red coats the way, that's all!"

"Clear out o' that!" yelled Henness.y "I give ye fair warning. *One!*"

"Come away, sir; come back. He's a desperate chap, he'll fire; he's mad, sir; there's murder in his eye!" cried half-a-dozen soldiers at once.

"*Two!*" shouted Hennessy.

Without another word the chaplain marched straight up to the madman, who who covered him with his musket as he advanced, and swearing he would shoot the parson dead, pressed the trigger with his finger as he roared, "*Three!*" Every one of the petrified and horror-stricken spectators expected to hear the report, and see the parson's skull shattered. But the keen, resolute, unflinching gray eyes of the brave man, who slowly advanced upon him, fascinated the furious lunatic; there was an aspect of command as well as of dauntless courage in the face and bearing of our hero in black, which must have rresistibly roused the man's instinct of discipline, and paralysed his murderous aim, for he allowed the parson to walk right up till the muzzle of the musket was not a foot from his head. Quietly grasping the weapon in one hand, Joseph Stickler raised the barrel above his head, and that instant the deafening report rang out, and the ball went crashing through the ceiling. So have dropped the discharged musket and seized another from the row that lay all cocked and loaded before him need have been, for Hennessy, only the work of a second. But the chaplain never took his eye of the madman's face, and the fellow was fairly cowed by that calm steady look, which seemed to pierce him throrgh and through. Slowly the parson's hnnd slipped down the barrel till it rested with a firm grasp upon the man's wrist. Then, without turning, he said coolly, with a ring of withering contempt in his tone,

"Here, sergeant, perhaps *now* you'll not be afraid to put this man under arrest!"

The sergeat summoned a couple sf file to assist him; but the madman, whose eyes were still rivetted on the parson's, made no effort at resistance, allowing himself to be seized and led away with a dazed look on his face, as ihough he had been gazing on something that had dazzled and blinded him. Then, amid the ringing cheers of the soldiers, the Rev. Joseph Stickler walked quietly out of the barracks.

Before next morning every man, woman and child in Donjonville had heard of the parson's heroism. Before the next Sunday the fame of it had spread all ronnd the country-side, and curious folks came in from far and near on Sunday evening to stare at the real live hero, who stood there in unheroic gown and bands, and delivered his homely homily as though wholly unconscious of the admiring eyes that were fixed upon him. I suppose no quality of head or heart so entirely wins the admiration of Englishmen as that of cool presence of mind under danger. We like to think and pride ourselves on the fact that it is preeminently a characteristic of the English race. But from the way in which we worship and adore the men who display it, a foreigner might be justified in cherishing the suspicion that we are conscious of its extreme rarity among us, and value it accordingly. I don't think that we Donjonville folks were one whit less plucky than our neighbours; but we must have been secretly conscious that under such circumstances we should hardly have borne ourselves so well as our parson, otherwise we should not have elevated him as we did with one consent, into the position of a hero. We were too proud of possessing a hero to be critical. His enemies and his detractors, and even he was not without these inevitable accompaniments of fame, said he was a glutton. It was a harsh term to use of one whose exquisite taste in gastronomy was to some of us one of the pleasantest features of his characters. He was a genial soul, was Joseph Stickler, when he unbent over those "little suppers," which were veritable *Noctes Ambrosianæ* to those who were permitted to partake of them; for our hero was not only witty himself, but the cause of wit in others. Happy mortals those who were privileged to be guests at these symposia! They could forget that they were in dreary Donjonville, and imagine themselves transported to some gastronomic Paradise, some culinary Elysium. No man is a hero to his valet, if we are to believe Madame Cornuel; but, I take it, a man may be a hero to his cook when that functionary is but the executant of ideas which emanate from the master-mind. Joseph Stickler had an excellent cook, and I am sure that in her eyes he was not one whit less a hero than he was in ours. Nor did the aureola of his heroism lose any of its radiance when he sat at the head of his own supper-table, keenly enjoying our enjoyment of the dainty dishes which had cost him more time and thought, perhaps, than any but an epicure could excuse. Had he had the ordering of the calendar I am sure that both Brillat Savarin and Abbe Delisle would speedily have been canonised as saints; and I am inclined to think they deserve the honour as much as some who figure on the saintly bead-roll. However, it was impossible that the *profanum vulgus*, which feeds, but knows not what it is to eat intelligently, should sympathize with this trait in the character of our hero in black. Nor will I insist upon claiming for that trait the right to be considered as on attribute of heroism, or even in itself to be pronounced heroic. But in the case of Joseph Stickler it had a posthumous reflection of the heroic thrown upon it, which is my excuse for introducing it here.

Our hero was smitten down with sickness; the weeks rolled on, and still we missed his portly figure and familiar face, which for five-and-thirty years had been as constant to Donjonville as the dial of the old Elizabethan clock, which from the castle-turret looked down upon the parade. Then at length came the sad news that we should never again see the "last of the Sticklers" in the flesh. He was dying of atrophy, we were told; he could retain no nourishing food; the daintiest dishes in the world were but a mockery to him now. Humorist as he was, he saw keenly the grim irony of Fate; and the last words he was heard to utter were these, spoken impressively, as he laid his wasted hand upon the arm of his oldest and dearest friend,

"They'll say it was a judgment, and they're right. Tell your friends, when I am gone, that you knew a parson who died of starvation because he had 'made a god of his belly.'"

Such was the hard measure he meted out to himself. But we judged him more leniently. We all, high and low, remembered only his virtues; we felt that we had lost a rare man in our hero in black, the like of whom we should never see again.

A Great Many Snakes.

RETAINING THEIR REPUTATIONS FOR LIVELY DOINGS TO THE CLOSE OF THE SEASON.

While workmen were opening a spring at Ralph's Station, Pa., they found fifty-one snakes secreted therein, where they were hid for the winter. The largest was four feet long.

A colored man at Parson's, Kansas, saved his life by his quick motion of his gun. A snake, 8 feet in length and 12 inches in diameter, was about to attack him, when a charge of shot silenced him.

Jacob Francisco, with some friends, unearthed fourteen copperhead snakes near Carrollton, Ky., and was bitten by one of them. His body swelled to an enormous size, and, although kept dosed with medicines, he suffered much until his death.

Jacob Terwillinger, a farmer in the mountains near Kingston, tells a rattlesnake yarn that is exhilarating. While gathering apples he fell into a bed of rattlesnakes. More than one of the snakes attacked him before he regained his feet, and one was fastened in his clothing. His 12 year old son, who was near, was of little help, but Terwillinger got a rough stick and attacked the snakes. In less than an hour he killed eight rattlesnakes, the largest measuring five feet, and having seventeen rattles. He was bit twice, but says whiskey saved him, and that it isn't bad for any kind of illness.

When Hans Wiger, a German butcher of Harrison, Ark., awoke from his little nap by the roadside, he was terrified to find a rattlesnake of the diamond species coiled about each leg, and both looking him hungrily in the face. He dropped back and lay as one dead, and went into a swoon. How long he remained in that predicament is hard to tell, but sometime after dark both snake uncoiled themselves, and, after crawling under his neck and around his head several times, moved quietly away. Wiger made tracks for the nearest house and fell fainting. After some trouble he was revived, but it was found that during his lying still blood had oozed from his eyes and mouth, and his hair, which he said was before raven black, had almost an iron-gray cast.

THEY have a new way of curing womens' hysterics in India. They tie the patients hands and feet together and then thrust cotton wicks steeped in oil up their nostrils and into her ears. A woman who has had hysterical dumbness will recover her speech n a very short time under this treatment.

PERSONAL.

GENERAL GARFIELD' youngest son, Abe, is quite an artist. One of his favorite drawings is a train of cars, in which everything is so faithfully represented that even an expert would find no part omitted.

THE house of Rothschild has recently been reorganized with a capital of $10,000,000. The financial head of the house, and director in its large operations, is Baron Alphonse Rothschild, who is also head of the house in Paris. He is a man of indefatigable industry, simple in habits, and proverbial as a pedestrian, one of his chief pleasures being a walk through the streets of Paris both before and after dinner. Baron Alphonse and Gustave and E. Rothschild each furnish a third of the capital. The registration of the deed of partnership cost $12,400.

COLONEL FORNEY, in the last number of *Progress*, has this paragraph: "I have just heard a good piece of news about my dear friend Jay Cooke, the philosopher, who, while as a marvellous leader as a banker, had to yield temporarily to misfortune, and to postpone the payment of his obligations. He is now on his financial feet again, and will soon be able to pay all his bebts. Considering that he went down in the crash of 1873, this is quick and honorable redemption."

"WHY are we brokers?" may be answered by the fact that the business is so remunerative that last week Mr. Metcalf, a partner of Mr. Ives, the president of the Stock Exchange, bought the seat of Mr. George Chapin for $20,500, and paid $1,000 admission fee to the Exchange in addition. The value of seats has of late appreciated more rapidly even than the price of stocks, for it is only a year or so since Mr. James Gordon Bennett paid out $10,000 for a seat, which he presented to his friend Mr. Lawrence R. Jerome. At the rate paid by Mr. Metcalf, the 1100 seats of the Exchange are worth about $22,000,000. One of its advantages is that at the death of a member his family or estate is entitled to $10,000.

THE new hotel of Baron Rothschild in Paris was formerly the property of the Marquis of Pontalba, who had repaired the fortunes of his family by marriage with a very rich creole of New Orleans. A capricious passionate woman, she led him a life which he patiently endured until she one day, in a pet, sneered at his poverty, and reminded him that the splendid mansion they occupied was hers. The Marquis said little, but presently with his children withdrew to a modest lodging, where they lived in the simplest manner on his own small means, in spite of the lady's entreaties for his return. The hotel was brought, stone by stone, from the Faubourg St Honore to its present site. It is a beautiful edifice. All the Rothschilds are invited to the house warming.

THE Princess of Wales, having visited Kensington Palace to advise on the fitting up of the apartments allotted to Princess Frederica of Hanover, was fascinated by Greuze's charming portrait of the Pompadour, who is depicted in a flowered silk dress, with lace fichu gathered up at the top of the bodice by a bow of ribbon, striped carmelite and white; upon her head is carelessly thrown a fanchon of lace, loosely fastened under the chin with a bow of the same striped ribbon. The whole toilet is as simple as possible, and in the most elegant taste. The Princess was immediately struck with the ease and grace of the coiffure, which, instead of depriving the countenance of all shadow, as is the case with the mob cap which has been the fashion so long, throws a shade becoming to every complexion over the face. The fanchon is consequently to become the fashion.

A Stalwart View of Art.

Scene—A room in a Highland mansion. Associate of the Royal Academy, arrived to paint portrait of a lady, encounters butler.

A. R. A. to butler—"Perhaps you will kindly give her ladyship my card, and ask her what hour will suit for sitting?"

Butler—"Sittin'! Good gracious! Her leddyship'll not set and watch you pentin'!"

A. R. A.—"My good man, I am going to paint a portrait."

Butler, pointing to a portrait—"What! Like these things on the wa'?"

A. R. A.—"Yes, just so."

Butler—"Weel, weel, that bates a'! I'm thinkin' a big strong man like you would be far better pentin' hooses."

THE British Geographical society is preparing for an Arctic expedition by way of Franz Josef land.

QUEBEC TIMBER TRADE.

The annnal trade circular, by Messrs. J. Be Forsyth & Co., has just been issued at Quebec. It says: We have again the pleasu of laying before the Trade our annual returns of Supply, Export and Stock winte ing at this Port with the usual comparativ statements, prices current, arrivals, &c., &c., all of which have been most carefully compiled.

Owing to the quantity of ice in the Gulf of St. Lawrence this spring vessels were detained in a most unusual manner, and few made their appearance before the end of May, when they commenced to arrive very freely; and notwithstanding the large number in port at the same time, they were as a rule loaded with dispatch. The arrivals of steamships exceeds those of previous years, and are more than double of what they were five years ago, being 261 steamers 492,670 tons this year, against 215 steamers 827,647 tons in 1879; in 1875 we find them to be 117 steamers 171,649 tons, and 89 steamers 113 287 tons in 1870. While this large increase in the carrying trade is done by steam, there is no diminution in sailing ships, 895 vessels 706,346 tons being entered against 666 vessels 492,670 tons last year. It will also be observed that 634 sailing vessels 553,45[illegible] tons cleared at this Port (lumber laden) this season.

When we penned our remarks just a year ago, we were able to state that a decided improvement had taken place in the Timber trade, and "with increased consumption and prices tending upwards in the British markets, we may look forward hopefully to the future." Happily, for all interested the expectations of the most sanguine have been fully realized; the manufacturers after contending with three years of great depression during which time they were often compelled to sell at less than the cost of production, have this year felt the benefit of prices which must have left very handsome returns, and were in many cases unprecedentedly high.

The trade of this port is in a sounder and more satisfactory state than it has been for years; the short supply of all woods this season, as will be noticed by glancing at the supply returns, as well as the full average export leaving us with exceedingly light stocks, the greater portion of which are held by the Shippers and which must suffice not only for the spring shipments, but also for part of the summer requirements.

WHITE PINE—*Square.*—The market opened last spring with prices in advance of what they had closed at the autumn previous, considerable number of old rafts changing hands at satisfactory rates; but with the arrival of fresh timber came a more decided improvement, and high figures were demanded and obtained during the remainder of the season. The maximum having been reached when some of the last transactions in choice wood took place. In examining the supply returns a discrepancy occurs which should be accounted for, the figures showing 4,244 285 feet measured, against 2,510,762 in 1879 yet we know the manufacture last winter was little over 2½ million feet. The facts are these, many rafts were laid up on their way to market in 1879, consequently were measured this season, while some lots of square and waney wintered over in the Coves unmeasured. The export is greatly in excess of that of either 1878 or 1879, and equal to the average of the past ten years, while the stock wintering is one-half of what it has usually been for the last twenty-five years.

In looking at the old circulars we cannot find any returns showing such a small quantity of white pine until we come to the year 1854 when square and waney in port measured 7,537,104 feet.

This stock on hand also contains about the usual proportion of common and inferior wood, suitable only for local requirements, for which there has been a steady demand all season, owing to harbour, railway and other works at present in course of construction, which demand is likely to increase if other contemplated improvements are carried out.

Concerning the manufacture this winter, it is impossible to write with any great certainty about it. On the Ottawa the "cut" will, it is stated, not exceed nine million feet of square and waney, even if it is all driven out of the small streams; while on the St. Lawrence and in Michigan, so much depends on the quantity of snow and its duration, that unless the hauling is favorable, a large proportion is liable to remain in the woods. In any case, the supply is not likely to exceed the average, and it must be borne in mind that the whole of last year's production has come to market, and apart from the small quantity wintering, we have to rely solely upon the new supply (always liable to be curtailed by a dry spring) for the shipments, not only of next summer and autumn, but also for the spring of 1882. We must also remind those of our readers who are not manufacturers, that the cost of producing this winter will be greater than last, owing to the enchanced rate of wages, &c.

WANEY has been in good request all season, the old lots finding purchasers at high rates. The stock now wintering is exceedingly light, barely sufficient for spring wants, and is chiefly held by the Shipping Houses. Lots to arrive early next season if not contracted for, must meet with ready sale. The great demand and high prices now paid for saw logs in Michigan and the West, may interfere materially with the production of Waney, and apart from the moderately small quantity making on the Ottawa, it is estimated that about 1½ to 1¾ millions may come from elsewhere.

		Supply.
1880	Square	4,244,285
	Waney	2,235,500
1879	Square	2,510,762
	Waney	1,599,635

Export.		Stock.
11,552,560	1880	6,197,318 Square. 797,346 Waney.
5,300,440	1879	12 139,523 Square. 2,217,888 Waney.

RED PINE.—Choice and good wood has been scarce and in request all season, the supply of this quality being limited as Lumbermen find difficulty in procuring it. The returns from the cullers' office show a good deal more than the manufacture of last winter from the same causes as those referred to in our remarks about white pine. The shipment has been nearly double that of 1879, and the stock wintering which comprises a large quantity of old and inferior wood is below the average of the past five years. The manufacture this spring will be light, and cannot arrive in time for spring requirements

	Supply.	Export.	Stock.
1880....	1,056,167..	1,433,200..	1,372,572
1879....	741,499..	813,800..	1,669,395

OAK.—This wood has felt the advance in prices as much as any and has been in request in season, especially good parcels. The production was moderate last winter, and notwithstanding that considerable remained behind at the rafting grounds from the previous years the receipts amount only to 1,790,230 feet. The export has run up to 2,316,840, leaving a stock on hand of 656,026 with which to commence shipment next season, a little over one-half of the quantity wintering last year and about one-third of the average of the past ten. This is the smallest stock we find recorded since 1863 when it was as low as 651,145 feet, and both scarce and dear the following spring.

	Supply.	Export.	Stock.
1880....	1,790,236...	2,316,840...	656,026
1879....	835,993..	1,681,000...	1,149,208

ELM.—The supply exceeds last year by almost 600,000 feet, the export has been very large and the stock wintering unusually light. Most of this has been "rock" of choice quality and has met with a ready sale, it is a difficult wood to procure, and the cost of standing timber is very high. The production for next season will be about an average one.

	Supply.	Export.	Stock.
1880.....	937,283..	1,041,800...	237,610
1879.....	336,461..	544,040..	331,536

ASH.—The receipts show an improvement, and the demand for fresh wood being active, it has been in good request all season. Many old lots have been moved off, and the stock wintering is unusually light.

	Supply.	Export.	Stock.
1880.....	245,480...	293,500..	136,319
1879.....	17,161...	172,480...	265,840

BIRCH.—This is about the only wood which was too heavily produced last winter and which has been difficult of sale all season. Owing to the very light stock in 1879, and high prices then ruling, many were induced to go into manufacturing this wood, but in the face of a heavy stock wintering and slight demand, operations will be greatly curtailed this winter.

	Supply.	Export.	Stock.
1880.....	574,314..	558,840..	176,693
1879....	121,095..	196,480...	31,629

TAMARAC.—This wood enters so little into consumption, that we must recommend our friends to discontinue the manufacture of it at present. Altho' very valuable for ship-building purposes, it has never been largely exported, and with the decline in ship-building its requirements cease. Should the ship-building trade with France revive, and which is much to be desired, this wood will again come into request.

	Supply.	Export.	Stock.
1880....	30,889...	Nil. ..	112,991
1879.....	6,691..	" ..	85,727

STAVES.—Both Standard and Puncheon have been in good demand, and very scarce during the latter part of the season. Our stave trade has dwindled down from a once large and prosperous business, which it was some twenty years ago, and has passed to a great extent into the hands of the Americans. In 1863, 2,211 M. of Pipe, and 3,564 M. of Puncheon, were shipped from this Port. Prices are exceedingly high as will be seen by referring to our prices current, the stock wintering the lightest on record.

		Supply.	Export.	Stock
1880	PIPE	196..	392..	206
	W. I.....	488..	921..	271
1879	PIPE	180...	660..	405
	W. I.....	169..	843..	770

DEALS.—*Pine.*—The supply and export show a wonderful increase in this branch of the Lumber trade, and when we take into consideration the fact that Deals shipped from the District of Montreal are not included in these returns, we have to admit that this branch of the lumber business is considerably on the increase. It is estimated that only about 45,000 to 50,000 Deals, included in our supply came from Michigan, the remainder being of Canadian manufacture. Deals have been in good demand all season, the heavy shipments in June and July causing them to be at one time very scarce. Prices have been good, and the large sales made to London firms some weeks ago stiffened the market, notwithstanding the rather unfavourable accounts from Great Britain. We do not believe the supply next year can much exceed that of 1880, while the cost of procuring logs will be greater, especially in the Province of Quebec, owing to the higher Government dues to be exacted.

The stock wintering in this market is unusually light, and has not been as low since 1872.

	Supply.	Export.	Stock.
1880....	5,320,000...	5,823,263..	1,626,158
1879.....	3,007,573...	4,202,219..	2,223,406

SPRUCE.—Have also been in good demand and shipped in large quantities. The dry spring and summer keeping back the logs, and causing exceptionally high prices to be paid. The stock wintering is light.

	Supply.	Export.	Stock.
1880.....	3,500,000..	3,200,130..	515,110
1879.....	2,474,865..	2,852,500...	682 634

FREIGHTS opened at 26s. Timber and 67s. 6d. Deals to Liverpool, 67s. 6d. Deals, and 27s. Timber to London, 25s. Timber and 65s. Deals to Clyde, closing at 30s. Timber, 75s. Deals to Liverpool, 70s. Deals to London, and 28s. Timber and 72s. 6d. Deals to Clyde.

LIST OF "COVES" AND OWNERS.

The following is a list of the various "Coves" where the stock on hand mentioned above is wintered. The names of the owners are also given, viz:—

Jacques Cartier Mills—E. L. Sewell.
Alexandria—J. Bell Forsyth & Co.
Cap Rouge—P. &. W. Comy.
Dalhousie—Forsyth & Dalkin.
Victoria—M. Rockett.
Ring's End—E. H. Jackson.
New London—O'Connell & Co.
Union—M. Stevenson & Co.
Sillery—R. R. Dobell & Co.
Do Safety & Bridgewater.
Do Sharples, Bros. & Co.
Do James Bowen.
Pointe a Pizeau—R. R. Dobell & Co.
St. Michael's—Cook Bros. & Co.
Woodfield Harbour—S. Connolly.
Spencer—Knight Bros. & Co.
Wolfe's—John Roche.
Cape and L'Ance des Meres—George Robinson.
J. H. Clint's.
Stadacona—J. & W. D. Brown.
St. Charles—John Home.
New Waterford—A. F. A. Knight & Co.
Montmorency Mills—G. B. Hall & Co.
St. Nicholas Mills—W. G. Ross & Son.
Chaudiere Basin—J. Breakey.
North Liverpool—Ritchie Bros.
Do Benson Bros.
Do Hamilton Bros.
Etchemin—H. Atkinson & Co.
Hadlow West—G. B. Symes Young.
Mill Cove—S. J. Bennett.
Hadlow—Price Bros. &. Co.
St. Lawrence—W. Dock & W. Co.
Windsor—G. B. Symes Young.
South Quebec—Warehouse Co.
Indian Cove—A. Gilmour & Co.
Do James Patton & Co.
Do J. MacLaren & Co.

Crooked Lake.

The Port Hope *Guide's* correspondent, writing from Crooked Lake says:—"Since my last, everything has being going on as usual; trees falling before the woodman's axe and teams continuing to haul them to the brink of the lake.

LUMBERING.

With regard to lumbering, you will please allow me to say a few words to lumbermen in general. There are two points in which they make a great mistake; first in setting wages equal, notwithstanding the difference in men. Now, from former experience, I contend that they lose thereby. Place three choppers in a gang, two are excellent choppers, the third an indifferent or worthless one; those two soon become weary of aiding him to complete a day's work, and will naturally conclude that they will do no more than he, as they receive no more wages. Secondly, stinting men to ascertain the number of logs per day; by so doing they lose in this wise—men will call and leave timber behind in order to fill their counts. Men should have a foreman competent to judge of a day's work for a gang, let the timber be what it will. Such foreman ought to be one of experience, who has filled the place of chopper, sawyer, skidder, loader and teamster. From such experience, if a small count is given at night, he next day, by going over the ground, could judge whether work was done or not. Men should be paid according to their work. I have seen both methods tried, and must say my plan proved the best for the lumberer. If any one can prove to the contrary, I am ready to hear him.

The Chicago Lumber Trade.

Chicago lumber traffic shows less increase over 1879 than might have been expected, considering the general activity in business in the North-West and the large immigration. The receipts are nearly all by water, so that they are now nearly complete for the year. There have been 1,518,863 thousand feet, against 1,408,739 last year, an increase of 109,624 thousand, or 7¾ per cent. The receipts in 1879 showed a large increase over several previous years, however, and this year's receipts are the largest ever known. The shipments down to the end of November were reported at 752,054 thousand this year, against 691,767—an increase of 8.7 per cent. The shipments are nearly all by rail, and these will continue till the end of the year, though not at a very rapid rate, as the lumber cannot very well be used this season. At Albany, the great lumber market of the East, the receipts for the season are reported at 361,598 thousand, less than one-fourth of the Chicago receipts. The shipments from the Saginaw lumber district (which mostly go south and east) were 769,573 thousand, and 90,000 or 18 per cent more than last year. One reason why the Chicago shipments have not grown more probably is that an unusually large part of the immigration this year, and of the demand for lumber, has been in Western Minnesota and Dakota, which get comparatively little lumber from Chicago, but have nearer sources of supply at the mills above St. Paul and in Wisconsin east and north-east of St. Paul.

LARGE TIMBER OPERATIONS.—The Hamilton *Times* says that Mr. M. F. Vansickle, of the township of Ancaster, has now three gangs of men making timber, and intends taking out 60,000 cubic feet this winter for the Quebec market.

Miramichi Lumber Trade.

J. B. Snowball, Esq. of Chatham, Miramichi, has issued his annual wood trade circular, dated, Chatham, Dec. 1st. 1880, in which he says, the season just closed, has been an exceptional one, The winter was fine for lumbering operations, but having less snow than usual and light spring rains, nearly a quarter of the season's drive was stuck in the brooks. Great efforts were made through the season to get these logs out, but the greater portion of them were only got to market about 1st November, and the cost of driving at that time had reached fully two dollars per thousand superficial feet.

Our river was clear of ice on the 26th April, but as the Gulf was blocked with drift ice, we had but one arrival from sea before 21st May. On that day eight vessels arrived; on the following day 28 arrived, and by the 3rd of June 125 lumber-carrying vessels were in port. This number was rather beyond our wharfage capacity and caused considerable inconvenience and annoyance to shippers.

The stock of sawn woods on hand at this time last year was heavy, but the improvement in the European as well as our own markets during the year stimulated shipments and the yards here are now almost bare.

The season of 1881 must commence with an entirely new stock, the volume of which will depend largely on the character of the winter for lumbering operations.

A lower rate of freight prevailed during the year than ship-owners at first expected, the early chartering from 65/ to 67/6, the summer rates from 60/ to 62/6 and the fall again advancing to 65/. These rates average about 5/ higher than those of the year previous.

The total stock, round and sawn, wintered last year on the Miramichi was 70,000,000 superficial feet. The stocks held over this season are as follows:

9,000,000 superficial feet of Merchantable Spruce Deals.
2,000,000 " " " Pine Deals.
5,000,000 Scantling 4ths and Ends.

16,000,000

and 9,000,000 s. f. of saw logs, one half of which are yet in the brooks or sorting booms.

The shipments of the last four years were as follows:

1877—150 Million superficial feet.
1878—106 " " "
1879—114 " " "
1880—155 " " "

The shippers from the Port of Miramichi are—

	No. of vessels.	Tons.	Deals, etc., s. ft.
J. B. Snowball	74	38,104	32,607,972
R. A. & J. Stewart	74	38,765	33,172,260
Guy, Bevan & Co.	66	33,747	27,578,133
W. Muirhead	31	15,675	13,843,910
D & J. Ritchie & Co.	33	15,496	14,630,576
A Morrison	27	12,649	11,208,912
Geo. McLeod	21	10,635	9,596,894
Geo Burchill	12	6,522	5,791,000
R. Hutchison	10	6,670	6,049,192
C. F. Todd	1	617	525,710
Totals	349	178,871	155,004,559

To this should be added 4,651,703 palings; 211,500 laths; 20,500 tons birch and 12,56 tons pine.

A well informed correspondent calculates that 150 million superficial feet of saw logs this winter on the Miramichi and its numerous tributaries.

Mr. Snowball's circular gives shipments from St. John:—vessels 338; tonnage 259,944; deals, &c. s. f. 215,485,000; Birch, 16 035 tons, and pine 2441 tons.

The shipments from Dalhousie are given:—vessels, 43; tonnage, 21, 639; Deals, &c., 15,262,845; palings, 39,305; birch, 3,661 tons; pine, 910 tons; Spruce, 1,364 tons; birch plank, 191,892 s. f.

From Bathurst the shipments for 1880 were:—vessels, 33; tonnage, 15,230; deals, scantling, &c., 12,125,946; palings, 812,302 pieces; pine, 80 tons.

From Richibucto (including Buctouche and Cocagne):—vessels 56; tonnage, 23,217; deals, &c., 21,372,346; palings, 41,200 pieces; birch, 355 tons.

From Caraquet:—27 vessels; tonnage, 12,199; deals &c., 10,917,080.

From Sackville:—10 vessels; tonnage, 3,925; deals 4,037009, s. ft, and 53,500 pieces palings.

St. John (N. B.) Lumber Exports.

The St. John *Globe* says, on Dec. 1st. last year we pointed out that as the result of the stagnation in the lumber trade in Europe the exports had fallen off 44,000,000 feet as compared with the same period in 1878,—that is the first eleven months of the year. To day, we are able to show that in consequence of the improved condition of the wood trade, which showed itself early in the year, the shipments have largely increased over the exports of the last few years, and rumour credits the shippers, especially those who held over stocks, with having made a great deal of money. The total shipments so far this year amount to 205,831,000 feet, compared with 142,694,000 feet in the first eleven months 1879, and 186,073,794 in the eleven months of 1878.

Mr. Gibson, as usual, leads the list of the shippers, furnishing more than one-third of the exports. The statement for 1880 is as follows:—

Shippers.	No. of Vessels.	Tons.	Deals. s. ft.
A Gibson	94	86,303	75,355,000
Carvill, McKean & Co.	55	33,523	29,358,000
R A & J Stewart	74	52,683	49,778,000
Guy, Bevan & Co	49	33,976	30,418,000
W M Mack	20	21,955	14,648,000
S Schofield	13	7,308	6,163,000
McLachlin & Wilson.	3	2,248	1,068,000
Sundry Shippers	18	9,711	8,053 000
Total	326	249,702	205,831,000

For 1879 the figures are:

Shippers.	No. of Vessels.	Tons.	Deals. s. ft.
A Gibson	28	31,614	29,233,461
Carvill, McKean & Co.	44	27,887	39,919,056
R A & J Stewart	57	41,056	35,986,999
Guy, Bevan, & Co.	27	16,298	14,931,419
Wm M McKay	28	31,728	33,460,318
S Schofield	13	5,837	5,175,707

Total	215	166,655	142,694,179

The exports of timber largely increased this year. In 1878 the birch sent forward amounted to 8,354 tons, and the pine 2,021; 1879, 10,682 tons of birch and 2,616 tons of pine were sent forward; this year birch exports amounted to 16,035 tons and pine 2,441 tons.

At the present time, the wood market is in a favourable state. The shipments for the remainder of the year will be light. A season of great activity is expected next year, and very extensive preparations are being made for it. An immense quantity of lumber will be got out on the St. John and its tributaries, and in other parts of the Province as well, and we can only hope the operators and speculators will not overdo the business.

Montreal Lumber Shipping.

During the past season thirty-seven cargoes of lumber, amounting to 19,784,855 feet, has been cleared through the Montreal Custom House to ports in the United Kingdom. The Montreal Export Lumber Co. publish a statement of lumber shipped from the St. Lawrence to the River Plate this season, which shows a total of 10,286,184 feet, of which they were the principal shippers.

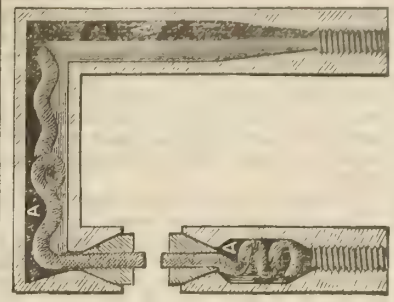
CORRECTION. — In the description of Messrs. Bronson and Weston's mills at the Chaudiere, the average amount cut annually should have read:—"About 200,000 logs, producing between 35 and 40 million feet of timber, of which from 10 to 15 million feet are always kept on hand." The eagle eye of the proof reader and the "bodkin" of the intelligent compositor permitted a number of glaring typographical errors to appear in last number of the LUMBERMAN.

New Saw Guide.

The following illustration of G. W. Rodebaugh's patent ready adjusting, self oiling saw guide, which has lately been introduced amongst saw mill men will explain its proper form.



It has given excellent satisfaction where used. The guide arms are hollow, and as shown in the cut, are provided with two oil chambers, into which the guide pins are inserted, made of leather firmly fastened together, 1¼ inches thick, (square), and are perforated to enable a wick which is inserted to feed the oil gradually. This is a positive self-oiler by capillary attraction; cannot waste a drop of oil, for there is nothing to draw the oil out of the chamber when the saw stops, or when the saw is oiled on the pin friction-surface. Those guides are strong and durably built from experience, and warranted in every particular.

They can be readily adjusted when desired by the sawyer when the saw is in the log, without endangering hand or limb, and will stay where you leave them.

These saw guides will be furnished to responsible mill owners on 10 or 15 days' trial free of charge, and if not satisfactory after trial, can be returned free of charge. Manufactured by Kerr Brothers, Walkervill, Ont. (see advt.)

The Michigan Lumber Trade.

THE ENORMOUS CUT IN MANISTEE. — NEW MILLS.

From the *Manistee Independent*, we learn that the increase in the lumbering and milling industry in that important section of the Michigan lumbering district during the current year has been somewhat enormous. The new shingle-mills of Davis & Blacker, R. G. Peters, John F. Brown & Co., and the addition to Mr. Canfield's shingle-mill will cut a total next year of 165,000,000 shingles, which, added to this year's cut of 435,000,000, will make a total of about 600,000,000, as the shingle cut for Manistee. The new saw-mills of John F. Brown & Co. and R. G. Peters will make a total season's cut of nearly 30,000,000 feet of lumber, which, added to this season's cut of 215,000,000 feet, will make about 245,000,000 feet as the total cut of lumber for next season.

Of the six or eight large new mills now in course of erection at Manistee, the *Independent* furnishes the following dimensions and interesting details of the two largest:—

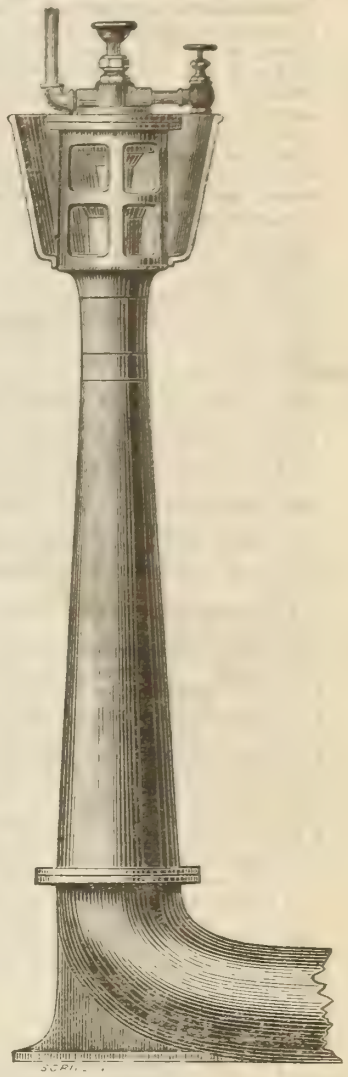
"The new mill of John F. Brown & Co., occupies one of the very finest sites imaginable. The main of the mill is 30x160 feet, with a west wing for a shingle-mill of 30x50 feet and an east wing for boiler and engine house, 40x52 feet. In the saw-mill there will be one circular saw, and edger and a bolting saw for blocks. The carriages and circular rigs will be of the latest improved Alliance patterns. The capacity will be about 65,000 feet of lumber per day. The shingle-mill will have one double-block Challoner and one hand-machine, which will give it a capacity of 150,000 shingles per day. The steam will be furnished by four large boilers, and the power by a 22x28 engine. Everything about the mill will be of the latest improved machinery, and it will be one of the most complete mills in the city. The mill is built from designs by Mr. John A. Jamieson, who gives his personal supervision to the work. Mr. Jamieson is one of the proprietors as well.

"R. G. Peters' new mill is rapidly approaching completion. The main is 40x123 feet, with a west wing of 30x75 feet for a shingle-mill, and an east wing of 42x50 feet for the engine and boiler house. There will be one circular-sew, edger and trimmer, and and a siding-machine in the saw-mill. The capacity will be about 80,000 feet of lumber per day. The shingle mill will have three double-block Challoner machines and a stealer, giving a capacity of 300,000 shingles per day. There will also be a lath mill. This mill is also built from designs furnished by Mr. Jamieson, and will be complete in every appointment."

Mr. Jamieson is an old Quebecer, being a native of the adjoining county of Quebec.

New Steam Blast.

The Steam Blast, illustrated by the sub' joined engraving, is known as "Killey's Patent Steam Apparatus, and is a very effective aid to steam power for burning, hard and soft coal screenings, hard coal, inferior coal of every description, inferior and wet wood, tan bark, pine and oak sawdust, in fact any kind of inferior fuel.



This apparatus is attached to the boiler, and feeds the draft through the grating underneath the furnace, The heat of the gases of combustion is fully utilized, while the smoke is completely consumed. No driving machinery is required, and no attention is needed except to regulate the quantity of steam, of which very little is used. A saving of 60 per cent of fuel is claimed, and the fire bars last much longer than with the ordinary draft. The apparatus is manufactured by J. H. Killey & Co., Hamilton, Ont., who will supply circulars &c., on application.

Three sizes are manufactured, and either can be attached to any boiler.

The Coming Stock of Logs.

The *Mississippi Lumberman* says of the coming stock of logs:—"It is a low estimate to say that the prospective cut is 25 per cent larger than that of 1879-80. The rivers cannot increase their output very much, because the driving capacity of most of the smaller streams have been taxed for some years past, as well as the handling capacity of the booms, but the chief increase will be from the railway mills, which are multiplying wonderfully in the States of Winconsin and Minnesota. We venture to predict that there will be over 200,000,000 feet more produced by the railway mills in these States in 1881 than during the past year. The bulk of this will come down from new mills."

"The Neighbour's Bairn."

(By Henry Irving, in "the Green Room.")

When, a year ago, we produced at the Lyceum, as a first piece, the old Scotch drama of "Cramond Brig," the various members of the company playing in the piece had full choice of wherewithal to wash down their "heed and harrigles"—(of which, by-the-way, over a hundred were consumed during the run)—and the miller's supper became a nightly jollity, except, perhaps, to the Scotch nobility and the king's huntsmen, who, with watery mouths and eager eyes, crowded the wings, forbidden by the irony of dramatic fate to enter upon the scene until the supper had been cleared away.

This piece had reminded me of an incident which came under my notice a good many years ago. In the off season of a large provincial theatre, in which I was a stock actor, I took an engagement at a small town, then known as one of the most thriving seaports of the North. The salary was little; the parts were long, and there was not much opportunity for gaining renown. However, it was better than remaining idle, as, at the worst, the amount of debt to be accumulated was minimised. The manager was not a bad fellow, and having been a good actor in his time, was only too glad to be surrounded by a class of actors whose services he could only obtain by the opportunity afforded by the bright summer—in those palmy days the darkest and wintriest season to the airy comedian or the thoroughly legitimate tragedian. Our opening bill consisted of "Cramond Brig," "Lord Darnley," "Wallace, the hero of Scotland," and "Gilderoy, the Bonnie Boy," in all of which I played, besides contributing my share in the National Anthem, which was right loyally and loudly sung by the entire strength of the company. After the rehearsal of "Cramond Brig," our jolly manager said, "Now, boys, I shall stand a real supper to-night; no pasteboard and parsley, but a real sheep's head, and a little drop of real Scotch." A tumult of applause.

The manager was as good as his word, for at night there was a real head well equipped with turnips and carrots, and the "drop of real Scotch." The "neighbour's bairn," an important character in the scene, came in and took her seat as usual beside the miller's chair. She was a pretty, sad-eyed, intelligent child of some nine years old. In the course of the meal, when Jack Howison was freely passing the whisky, she leaned over to him and said, "Please, will you give me a little?" He looked surprised. She was so earnest in her request that I whispered to her, "To-morrow, perhaps, if you want it very much, you shall have a thimbleful."

To-morrow night came, and, to my amusement, she produced from the pocket of her little plaid frock a bright piece of brass, and held it out to me.

I said, "What's this?"

"A thimble, sir."

"But what am I to do with it?"

"You said that you would give me a thimbleful of whisky if I wanted it, and I do want it."

This was said so naturally that the audience laughed and applauded. I looked over to the miller, and found him with the butt end of his knife and fork on the table, and his eyes wide open, gazing at us in astonishment. However, we were both experienced enough to pass off this unrehearsed effect as a part of the piece. I filled the thimble, and the child took it back carefully to her little "creepy" stool beside the miller. I watched her, and presently saw her turn her back to the audience and pour it into a little halfpenny tin snuff-box. She covered the box with a bit of paper, and screwed on the lid, thus mrking the box pretty water-tight, and put it into her pocket.

When the curtain fell, our manager came forward and patted the child's head. "Why, my little girl," said he, "you are quite a genius. Your gag is the best thing in the piece. We must have it in every night. But, my child, you mustn't drink the whisky! No, no! that would never do."

"Oh, sir, indeed I won't; I give you my word I won't!" she said, quite earnestly, and ran to her dressing-room.

"Cramond Brig" had an unprecedented run of six nights, and the little lady always got her thimbleful of whisky, and her round of applause. And each time I noticed that she corked up the lormer safely in the snuff-box. I was curious as to what she could possibly want with the spirit, and who she was, and where she came from. I asked her, but she seemed so unwilling to tell, and turned so red, that I did not press her; but I found out that it was the old story—no mother, and a drunken father.

Still, it was strange; what could she want with the whisky—a child like her? It could not be for the drunken father. I was completely at fault. I took a fancy to the little thing, and wished to fathom her secret, for a secret I felt sure there was. After the performance, I saw my little lady come out. Poor little child! there was no mother or brother to see her to her home. She hurried up the street, and turning into the poorest quarter of the town, entered the common stair of a tumble-down old house. I followed, feeling my way as best I could. She went up and up, till in the very top flat she entered a little room. A handful of fire glimmering in the grate revealed a sickly boy, some two years her junior, who crawled towards her from where he was lying before the fire.

"Cissy, I'm glad you're home," he said. "I thought you'd never come."

She put her arms round him, laid the poor little head on her thin shoulder, and took him over to the fire again, trying to comfort him as she went.

"Is the pain very bad to-night, Willie?"

"Yes." A sadder "yes" I never heard

"Willie, I wish I could bear the pain for you."

"It's cruel of father to send me out in the wet; he knows how bad I am."

"Hush! Willie, hush! he might hear you."

"I don't care! I don't care! I wish he would kill me at once."

The reckless abandon of the child's despair was dreadful.

"Hush! hush! he is our father, and we must'nt say such things!" This through her fast-falling tears. Then she said, "Let me try and make the pain better."

The boy took off his shirt.

The girl leaned over and put her arm round him, and kissed the shoulder; she then put her hand into her pocket and took out the snuff-box.

"Oh, Willie, I wish we had more, so that it might cure the pain."

Having lighted a dip candle, she rubbed the child's rheumatic shoulder with the few drops of spirit, and then covered up the little thin body, and, sitting before the fire, took the boy's head on her knee, and began to sing him to sleep.

I took another look into the room, through the half-open door; my foot creaked; the frightened eyes met mine. I put my finger on my lips and crept away.

But, as I began to descend the stair, I met a drunken man ascending—slipping and stumbling as he came. He slipped and stumbled by me, and entered the room. I followed to the landing unnoticed, and stood in the dark shadow of the half-open door

A hoarse, brutal voice growled, "What are you doing there?—get up!"

"I can't, father; Willie's head is on my knees."

"Get up!"

She gently laid the boy's head on the floor, pillowed it in her little shawl, and stood up.

"Father, Willie is very sick! you ought to try and get him cured."

"Shut up. If I hear another word, I'll make you and him too keep yourselves quiet." And the brute flung himself on his bed, muttering to himself in his drunken semi-oblivion, "Cure him, indeed! Not if I know it. That's not the way to get the money; his cough is worth a lot alone. Cure him, indeed! Not likely!"

The black-hearted scoundrel!

The girl bowed her head lower and lower.

I could not bear it. I entered the room. The brute was on the bed already in his besotted sleep. The child stole up to me, and in a half-frightened whisper said, "Oh, sir, oughtn't people to keep secrets if they know them? I think they ought, if they are other people's." This with the dignity of a queen.

I could not gainsay her; so I said, as gravely as I could, to the little woman, "The secret shall be kept, but you must ask me if you want anything." She bent over, suddenly kissed my hand, and I went down the stair.

The next night she was shy in coming for the whisky, and I took care that she had good measure.

The last night of our long run of six nights she looked more happy than I had ever seen her. When she came for the whisky she held out the thimble, and whispered to me, with her poor, pale lips trembling, "You need only pretend to-night."

"Why?" I whispered.

"Because he doesn't want it now. He's dead!"

SOME of the most timid girls are not frightened by a loud bang.

Died Like a Gentleman.

A KENTUCKY LAWYER'S IDEA OF SELF-MURDER WITH PROPRIETY, AND HOW HE REALIZED IT.

Hayden H. Shouse recently said, while talking with a friend about a man who had blown his brains out, "It was a dirty thing to do. Nobody has a right to make a mess of himself in that manner. There are 600 different ways of committing suicide in a gentlemanly way. Shooting and cutting are disgusting, and no man of sensibility and taste would disfigure himself. Opium offers the best means of suicide, and if ever I conclude to go, I'll take it. A man can go to sleep like a gentleman and wake up at his destination. There is no blood, no horror." Mr. Shouse was noted for being singularly handsome. His face, when he was younger, had been described as Raphael-like, and a maturity of heavy eating and drinking had not robbed him of his beauty. He was a lawyer residing at Henderson, but his reputation and practice extended all over Kentucky. He was a candidate for the Congressional nomination in the Second district last fall.

Recently Mr. Shouse turned from a table on which he was writing in a public room of the Louisville Hotel and read to a perfect stranger in the room a letter that he had written. It was a request that the person to whom it was addressed would receive his body and bury it, and it enjoined a quick transportation, so that the remains might not suffer injury on the way. The lawyer's manner was distraught, and the listener, seeming him a lunatic, walked away, without regarding the matter as of any importance.

The matter was soon afterward related to the hotel clerk, who knew that Mr. Shouse had been drinking heavily, and feared that the letter had been written in earnest. He and a physician went to the lawyer's room and found him dying neatly in bed from opium. Everything possible was done to save his life, though he protested against the rude treatment, and he died.

Just after his death came this despatch from his father-in-law:

ETANSVILLE, Ind., Dec. 1.

Phil. Judge, Louisville Hotel:

Hayden Shouse is a noble soul. If he is not dead, tell him to live for Vancie and Mollie. A thousand friends will sustain him. If he is dead, comply with his request, and send bill to me.

S. B. VANCE.

"Vancie" is Mr. Shouse's baby and "Mollie" his widow.

Mr. Shouse made his mortuary preparations with a degree of tranquil forethought which seems somewhat remarkable. Two weeks ago he left his home at Henderson, spent a night at Evansville, and came to Louisville. He had been drinking, and continued until he made himself sick, when he had a doctor and got better. He gambled recklessly for several days, and appears to have lost about $3,000. The day before his death he paid up insurance policies on his life to the amount of $8,000. Later he went to an express office, put about $60 in money, some private papers, and his watch in a small box, directed it to his wife, paid the charges and took a receipt. Then it seems he went to his hotel and wrote and read aloud the letter before alluded to. This crowding of a personal matter upon the attention of an utter stranger showed a lack of gentlemanlike reserve so foreign to Mr. Shouse's character as to seem to his friends evidence of insanity. When he had finished the letter, it appears that he went to his room, took a bath, put on fresh linen, and, having fixed himself as nicely as he could for the trip he had in prospect, he took the laudanum and got into bed.

It is said that he was delicate in appearance, but of an iron will; that he was addicted at times to the intemperate use of liquor; that he had a remarkable sense of humour, and could be sarcastic when he chose.

On the night he died one of his friends said: "If Shouse could see these people trying to resuscitate him, he would be the maddest man in the State."

When he was first found in bed an emetic was brought to him, and he was asked to take it, but he said, "No, I won't; I didn't take poison for that purpose."

No satisfactory reason is given for Mr. Shouse's action. "Self-Help," by Samuel Smiles, was not found among his effects. It is said that his gambling losses were no large enough to have caused fatal uneasiness. But his health was shattered and he feared consumption; and, although he had a wife and child, it seemed advisable to him not to live, and he got away as narrated.

How to Act in Case of Fire.

American Builder.)

Better than all the elaborate and costly apparatus for extinguishing fires are constant care and watchfulness, and quick and intelligent action on the part of those who first discover a fire in progress. The fire which at its beginning could be smothered with a pocket-handkerchief, or dashed out with a bucket of water, neglected a few hours, lays in waste millions of dollars worth of property. If there is any time in which a person should be cool and calm, in perfect command of himself, it is when he discovers a fire that threatens the destruction of life and property. The first thing to do is to learn precisely where it is; the second, to consider the chances of extinguishing it. Of course, in cities, an alarm should at once be sent out, but at the same time a vigorous effort should be made to put out the fire with the means at hand; for sometimes what the fire engine is unable to accomplish when it reaches the scene, can be done by one or two persons who act promptly before the flames have had time to gain headway.

First, then, do not be alarmed on account of smoke. Frequently there is a great deal of smoke before the fire has made much progress. Remember that one can pass through smoke by keeping his head near the floor, or by enveloping it in a wet woollen cloth. On entering a room to fight down a fire single handed, keep the door closed behind, if possible. A pail of water and a tin dipper, in the hand of a resolute person, can be made to work a miracle at the beginning. If the fire has progressed too far to admit of this course, and it is necessary to depend entirely on outside help, then see to it that every door and window is closed. By so doing, where there is a fire engine in the neighbourhood, it will often be possible to confine the fire to one room.

Every person who stops at a hotel should take special pains before retiring to note the location of the stairways, so that in case of an alarm he can find his way out, even though the halls are filled with smoke. Never leave a room when there is an alarm of fire without first securing a wet towel, or, if possible, a wet sponge or piece of woollen cloth, through which to breathe. If escape by the stairs is cut off, seek an outside window and stay there till help comes. Above all things be cool and have your wits about you. When a lady's dress takes fire, let her fall on the floor at once and call for help, in the meantime reaching for some rug or woollen cloth, with which to smother the flames. There is nothing new in this advice. It has been repeated in one form or another hundreds of times; but it will bear repeating thousands of times.

The Coming Year.

There are a number of curious things with regard to the figures and their relations in the year 1881. From right to left and from left to right it reads the same. This will not happen again for a long time to come—just how long we will leave for the reader to determine. The first two figures of 1881, divided by 2, give 9, and the last two figures, divided by 9, give 9 also. If the figures of the year be divided by 9, the quotient will contain a 9, and if multiplied by 9, the product will contain two 9's. If the first and figures be added together, the product is 9, and if the last two figures be added, the sum is 9 also. If the first two figures be placed under the last two, and added, the sum will be 99, and 18 is 2-9 of 81. By adding, dividing, and multiplying, nineteen 9's are produced, or one 9 for each year required to complete the 19th century. The year that is before us is certainly peculiar in a figurative sense. What else this coming year, that will soon be upon us, may bring can be better told upon the morning of Jan. 1, 1882, when it will give place to its successor.

Capt. O. A. Horne's construction party at Arlington, Ga., went into their tent at night and were greeted by the rattling of a dozen or more snakes. The cook found one in his bed waiting company. Capt. Horne had his men fall into line, each one armed with a stout fence rail, and marched to a more agreeable place for the balance of the term.

India Rubber and Where it Comes From.

The following description of the India rubber tree, and of the manufacture of India rubber was written by Col. A. R. Perria Labra, an enterprising merchant of the Rio Purua and also a member of the house of deputies of the province of Amazones, who has published it in pamphlet form and was condensed by a correspondent of the Boston *Journal*, from which paper we copy it :

The "Seringneria" is a tall, perpendicular tree with little foliage, growing and thriving on low land in a dense forest of perpetual verdure. It attains a height of from 20 to 40 metres and a diameter of about one metre, but generally less. The leaf at a distance looks like that of the "Moniva" on account of its length, division and colour. It falls during the month of September, the summer season, but after 15 days the tree is clothed with new foliage. The seed is very similar to that of the "Mamona," but is smaller and contains oil of the same nature. The sap of the tree is as white as, and of about the consistency of, very rich milk or very poor cream, and from this is prepared (by and of the smoke of burning "dococo' kdried palm nut an elastic substance well "nown throughout Europe and America as in India rubber," but called here "Borracha" (a leathern bottle) on account of the form it takes as prepared for market.) An infinity of uses and application for this material and the products of its manufacture gives a rich and valuable return to the producer, and a constantly increasing demand and to sustain these high prices ruling in the principal markets of Europe and America as well as at Para. Its extraction and preparation may be considered even to-day a new industry, as well as an inexhaustible source of wealth. The rivers Madeira, Juvua, Xingua and Purus, as well as other affluents of the Amazon, have been already explored and worked to advantage. The Purus, to the distance of 800 leagues, with its many lakes and tributaries, produces this tree abundantly, and its forests have already been explored for the distance of 900 miles. Each labourer, man or woman, no matter which, can collect daily from 11 to 13 pounds of fine rubber, worth 62 cents per pound, and there are some who extract from 17 to 22 pounds. The average production is about 100 pounds to each person, but there are men who have made double that amount during the season. The danger of destruction to this fountain of wealth exists in the ignorance and recklessness of the workmen, who often kill the tree by careless and neglectful tapping. Their employers take no pains to prevent this, as they pay nothing for the land or the trees.

At the beginning of the summer the labourers commence to locate themselves among the seringas. Here on the Purus this period is from the last of April until January, but the best time is from May until September, when the tree sheds its leaves. After the new foliage starts, the milk contains much water, and the rubber, in relation to the quantity of milk, is diminished two-thirds of its ordinary weight. In preparation for, and to facilitate, the collection of the milk the labourers make through the woods a path called "estrada," or a street, to the foot of each seringa tree, until they reach 80 to 120 trees, clearing away all bushes and other obstructions around each. This is done with a large American knife, but a bush scythe would be better. Having completed this work the laborer places at the foot of each tree the little cups for collecting the milk called "tigelinkas" distributing usually from three to eight to each tree, according to its size, until 500 to 700 "tigelinkas" have been disposed of. He then makes six or more slashes in the bark with a large knife so that the sap will flow. Some waste several days in this preparation, which being completed on the following morning very early they commence the extraction and collection of the milk. Between the hours of five and six the workman goes out on his path with a machiduha, (a very large knife) a mass of damp and plastic clay of the consistency of putty, and a vessel or bucket in which to collect and convey the milk to the smoker. Passing round the tree he makes with his knife oblique and downward slashes from the corners of the horizontal ones made before, like the letter V, to lead the sap into the cup, which he fixes at the point of junction with a little of his wet clay, continuing the same operations with each tree on his path until he reaches the last. He then immediately and very quickly returns to the first, where, with his bucket on his arm he proceeds to empty into it the "tigelinkas" which are filled with milk, leaving them at the foot of the tree or hanging to a neighbouring one, until he has collected the milk from all the trees, having done this he conveys it in haste to the smoker, who converts it into rubber and then empties his bucket into a large zinc or earthern basin.

In a large earthern pot without a bottom is kindled with the nut of the palm tree a fire, which makes a dense smoke that ascends through the neck of the pot. The smoker has a wooden mold with a long handle, shaped like a paddle, over which he pours with a gourd a quantity of milk and then passes it over the smoke, which it rapidly hardens, leaving on the mold a filament the thickness of a sheet of paper. He continues to repeat this process until he has used up all the milk in the basin, which takes about two hours, more or less, according to the quantity. The next day he makes a cut round the blade of the paddle by which he withdraws it, putting the rubber in the sun to dry. When it is well smoked it is of a dull yellow color, and when badly smoked a dirty white. Nevertheless, in the course of time both become black. Through remaining too long in the smoke, or through the negligence or want of activity in the smoker, the milk coagulates before it is thoroughly smoked, and this causes the difference in the quality in the rubber as clasisified, "fina, entre fin, and sernamby." The "fina" is made from the milk in perfect condition, the "entre fina" when it is saturated and begins to coagulate, and the "sernamby" when the milk coagulates naturally, or there has fallen into it some extraneous substances, such as water, bark and pieces of rubber, or on account of the uncleanness of the vessels in which it is collected. All the milk that remains in the cups after emptying, or that runs down the sides of the trees, coagulates and makes "sernamby" only two-thirds the value of "fina." This work is repeated day after day, the gashes that are made in the trees at the distance of one decimetre from the ground are repeated one over the other, as high as a man can reach, and the cups are raised successively round the trees and each change is called by the workmen, "reacao." This is usually the work of one week. The patus or estrados, will not last over three months of steady working ; therefore it is necessary for the rubber gatherer to prepare two for the season. Some make four. Here on the Purus, of which I have been specially speaking, they always use two or more.

A Horse's Revenge.

Horses are not usually vindictive or revengeful, but leave their wrongs to be redressed by the Society for the Protection of Animals. Occasionally, however, they take upon themselves to punish those who ill-treat them, as is shown by the following incident, which was witnessed lately in the streets of Paris : A carter driving a heavily-laden vehicle through a narrow street contrived, through his own awkwardness, to entangle the animal's legs in the shafts of the cart. Instead of endeavouring to liberate his horse he commenced striking it brutally on the nose and head, and continued doing so during during some minutes, notwithstanding the indignant remonstrances of the lookerson. At first the poor beast bore patiently these unmerited blows, but after a while, maddened by the pain it suffered it retaliated by seizing the man's right arm between its teeth, lacerating the flesh and breaking the bone in three different places. The spectators who interfered at this juncture and tried to force the animal to let go its hold were not touched by the horse, but it resolutely refused for some time to relax its grip upon the carter's arm, and when at length the man was removed to a little distance it endeavoured perseveringly to get at him again. The injuries received were so serious as to necessitate the immediate amputation of the lacerated limb, and the patient lies at the hospital in a critical condition. Wanton ill-usage of animals is, however, so cowardly an offense that one can hardly feel much sympathy for the sufferer.

GARIBALDI left his peaceful home, notwithstanding his severe prostration, and went to Milan, receiving an extraordinary ovation there, in order to gratify his wife, who was determined to have him appear with her in the town where she was formerly a humble peasant woman.

A WOMAN accidently went to church with two bonnets on her head—one stuck inside the other—and the other women in the congregation almost died of envy They thought it was a new kind of bonnet, and too sweet for anything.

Sawdust as Bedding.

A correspondent of the *American Agriculturist* writes : We have tried for two years dry sawdust in the cow's stable, and on the whole like it better than any bedding we have ever tried. It makes a more comfortable bed, completely absorbs the urine, and the cow is kept clean with less labour than when any other is used. The objection to salt-marsh sods, dried, or to headlands and dry muck is, that they soil the cow and make it necessary to wash the bag before milking. Straw, of all sorts, soon becomes foul, and without more care than the average hired man is likely to bestow, soils the cow's bag also. Dry sawdust is clean, and makes a soft, spongy bed, and is an excellent absorbent. The bag is kept clean with the aid of a coarse brush without washing. A charge of 15 bushels in a common box-stall, or cow stable will last a month, if the manure, dropped upon the surface is removed daily. The porous nature of the material admits of perfect drainage, and of rapid evaporation of the liquid part of the manure. The sawdust is not so perfect an absorbent of ammonia as muck, but it is a much better one than straw, that needs to be dried daily in the sun and wind to keep it in comfortable condition for the animals. In the vicinity of saw and shingle mills, and of the ship yards, the sawdust accumulates rapidly, and it is a troublesome waste that mill owners are glad to get rid of. It can be had for the carting. But even where it is sold at one or two cents a bushel, a common price, it makes a very cheap and substantial bedding. The saturated sawdust makes an excellent manure, and is so fine that it can be used to advantage in drills. It is valuable to loosen compact clay soils, and will help to maintain moisture on thin sandy and gravelly soils. There is a choice in the variety of sawdust for manure, but not much for bedding. The hardwoods make a much better fertilizer than the resinous timber. To keep a milch cow in clean, comfortable condition, we have not found its equal.

A Profitable Traffic.

(From the London Telegraph.)

An entirely new branch of industrial business in connection with the still thriving trade in relics of cannonized ecclesiastical notabilities has recently been developed by the monks of Mount Athos, who annually dispatch a large number of reverend travellers in this particular class of commodity to the Russian Government of Orenburg. A lively and chronic demand for relics appears to obtain among the inhabitants of this province, and the latest expedient for keeping up the necessary supply adopted by the priestly purveyors does infinite credit to their ingenuity. Having provided themselves before starting on their rounds with a few good solid bones of departed saints, duly authenticated by some exalted episcopal or monastic authority, they proceed to saw up this stock into extremely thin slices. Each slice is then framed and glazed, in the manner of a miniature portrait, and either exhibited to the credulous peasantry for a moderate fee, or parted with altogether at a heavy figure to some devout capitalist whose means permit him to become the absolute possesser of so precious an object. About six weeks ago a party of these sagacious Sawbones set up a booth in the portico of Orsk Cathedral, and have since done uncommonly well, according to the Cologne Gazette, in framed fragments of wonder-working tibia and femora, once doubtless, used for locomotive purposes by saints and martyrs of indisputable merit. But the astute relic-retailers, in view of the hardness of the times just now in Russia, have supplemented their special trade by large dealings in blessed balsams, sanctified salves, and miraculous mixtures, which are eagerly bought up at top prices by infirm and sickly believers. It is estimated that within the last six years the monks of Mount Athos have realized 2,000,000 roubles—about £300 000—clear profit, by their sales in Russia alone.

A LADY in the New Haven Hospital, who had been taking morphia in order to get sleep, for many nights was given a bottle labelled "sleeping drops," but filled only with water. She complained that the medicine was rather strong and braced her head, and after the dose was reduced slept comfortably every night for a month.

PRINCE RUDOLF of Austria, after an old family custom, has sent flowers to the Princess Stephanie every morning since their betrothal, no matter where she may have been staying or travelling.

FACTS AND INCIDENTS.

IT was calculated in England some time ago that not one book in 1,840 goes through a second edition, and not one in many thousands a third.

THE Government of Italy pays only $12,000,000 yearly for pensions, despite two or three wars and revolutions and the pensioning of civil officials.

MRS. YOAKAM, of Coos River, Oregon, carries on a farm with the help of one hired man, and she and her daughter last season aid down sixteen hundred pounds of butter.

THE three Roman Catholic churches of Toronto have gone into the risky business of conducting savings banks. These are small institutions, however, and are intended to encourage little hoards. The banks are open only on Saturday evenings, and the total amount on deposit is about $15,000.

A GERMAN named Rubner has been making some interesting experiments to determine what proportions of the several ingredients of various foods are absorbed in the body. It was found that with carrots and potatoes no less than 39 per cent. passed through the body, leaving 61 per cent. to be retained. It was proved that far more of flesh is retained than of any other food.

THE public receipts of the Japanese empire for the year ending June 30, 1880, were about $55,000,000. The expenditure was equal to the income. The public debt is $250,000,000, but very nearly four-fifths of it partakes of the character of terminable annuities. The interest and the debt average 6 per cent., whereas the ordinary rates of interest in Japan range from 4 per cent. to 9 per cent., and the Chinese government had to pay 8 per cent. on its last loan.

SIR E. J. REED, Naval Constructor, writes that the Livadia, 335 by 153, at her very first trials, and under some temporary disadvantages, attained a speed of nearly sixteen knots an hour. On her way to Spain the weather showed signs of becoming very rough soon after they left Brest, but the Grand Duke Constantine, Lord High Admiral of Russia, refused to put back considering the opportunity an excellent one for testing the vessel. "We consequently steamed away into the very teeth of the Bay of Biscay gale, which gradually grew angrier, and the following morning blew at its wildest. Her steadiness was most remarkable. The confidence of the Duke, in refusing to turn back, was justified, and both Admiral Sir Houston Stewart, the Comptroller of the Navy, who was on board and myself are indebted to his Royal Highness for a most instructive sea experience." The damage done to her was by wreckage.

Ireland is still Ireland, and the social storm still pipes higher and higher. In spite of all that is said, those who live will see that the union will not be repealed, and that landlords will not be abolished. Peace will be brought back, if force is necessary, with the strong hand, and there will be very thorough changes in the land laws, and something like equity and reasonableness brought to hold sway in the relations of landlord and tenant. And whether or not the House of Lords throw out such remedial measures they are bound to pass, and the more they are opposed the more thorough and far-reaching they will eventually be made. Aye, and the changes won't be confined to Ireland. The land question booms largely up in England and Scotland also, and before all the play is played out there will be changes effected which will fill some with horror, but a great many more with gladness and gratitude. A man that lets out the use of a certain raw material called land, has a right to his rent and to the land back again, but not to all the improvements the tenant has made on it by his skill and capital. These in justice belong to the man who put them there, and the way landlords have for generations coolly taken possession of them, as if it were all right, is just as disgusting as it is monstrous. In fact, the relations between landlord and tenant even in Canada, need a good deal of straightening up, for they are generally of a very jug-handled description—all being in favour of the stronger party. What sense is there in all that power of summarily seizing all that may be on the premises for rent? Why should the landlord have precedence over every other creditor? Indeed a good many other "why's" might be put in this connection not easily answered, except that the landlords have had the greatest say in making the law, and have generally taken good care of themselves and their class interests.

THE CANADA LUMBERMAN

HAND MILLERS', MANUFACTURERS', AND MINERS' GAZETTE.

ISSUED SEMI-MONTHLY AT TORONTO, ONT.

A. BEGG, Proprietor and Editor.

TERMS IN ADVANCE (Post-paid):

One Copy one year..... $2 00

Communications, orders and remittances should be addressed to A. BEGG, LUMBERMAN Office, 33 Adelaide Street West, Toronto

TORONTO, ONT., DECEMBER 31, 1880.

NEW YEAR—1881.—To the readers of the LUMBERMAN, one and all, we wish a Happy New Year, with many returns of the season.

THE CENSUS.—The Census for the Dominion is to be taken on the 4th of April.

PARLIAMENT.—The Dominion Parliament, which adjourned over the Christmas holidays, will meet on the 4th of January.

DEFERRED NOTES.—During the latter part of this month we have made several journeys amongst our patrons, and have taken copious notes, which will be extended for next issue.

THE SNOW.—At Bracebridge the depth of snow is about twenty inches. Towards Rosseau it increases to two feet. Nearer Parry Sound the depth decreases to about 18 inches. Around by McKellar, Spence, and Ryerson, the depth is two feet, but at Lake Nipissing there is only about one foot deep. Very litttle frost in the swamps.

MUSKOKA AND PARRY SOUND.—Logging operations and the getting out of square timber in the Muskoka and Parry Sound Districts are progressing vigorously. The men are in excellent spirits. Few accidents have occurred so far, this season. The epizootic, which broke out among the horses at the shanties, is decreasing, and teams are able to do their full work. Cutting is about over in some of the camps. The cut of the season will be given as fully as possible next issue.

IMPORTANT DECISION.—The case of McLaren *vs.* Caldwell came to a close at Perth on the 15th inst., after occupying 11 days. The question to be decided was whether the Mississippi river and two of its tributaries, viz., Buckshot Creek and Louise Creek, were floatable in a state of nature, and if not, whether the defendant had any right to float logs or timber down the stream without the consent of the plaintiff, who had gone to a very large expense in erecting dams and slides. Judgement for Mr. McLaren, on the ground that before the improvements were made the stream was not floatable.

OTTAWA SQUARE TIMBER,

The names of Messrs. G. & A. Grier, of Kippewa, should have been inserted in the list published on the 15th inst., of square pine to be got out this winter on the Upper Ottawa, for 120,000 feet; also Capt. Young, of Temiscamanque, for 150,000 feet. Mr. Letour is likely to get out 600,000 feet, which with other additions, on account of favourable weather, will bring up the whole quantity of square timber on the Ottawa and tributaries to at least 10,000,000 cubic feet this season.

OUR QUEBEC LETTER.

THE STOCKS WINTERING IN QUEBEC—MESSRS. FORSYTH'S ANNUAL TRADE CIRCULAR—SPRUCE LOGS—MINING NEWS.

QUEBEC, December 24th.

The various lumbermen doing business here have made up the annual returns of timber actually wintering in their coves. The details will be found in the annual trade circular of Messrs. J. Bell Forsyth & Co., which has already been sent to the LUMBERMAN. The circular has just made its appearance, and as usual has been in large demand. Its statistics of the year's business, and comparative statements must have been prepared at a large expense of time and labor, and are very valuable. The estimates which it forms of next year's business, and of the probable cut of the present winter, agree precisely with the calculations contained in some of my previous letters.

Great activity is reigning this season in the shanties of Beauce, where very large quantities of spruce logs are being taken out for next year's cutting.

THE GOLD MINES OF BEAUCE.

Public attention having been directed very much of late to the gold regions of the Chaudiere valley, a hasty resume of what has been done towards developing the resources of the district may not be uninteresting. For many years past it has been known that rich veins of gold existed on the rivers Gilbert, Des Plantes, Du Loup, La Famine and State Creek. Important works were undertaken on most of these locations in 1864, 1865, 1866 and 1867. Amongst others, Messrs. Bertrand, Poulin, Douglass, McRae, Nash and Lockwood on the Gilbert, and Mr. Oley on the Du Loup, retired with large profits. Mr. McRae, it is reported having realized $15,000 in six months. Since the difficulties between the miners and the De Lery Co. set in with reference to mining rights, but little has been done on the Chaudiere. In 1876, however, a company of miners, the Messrs. St. Ouge, made amicable arrangements with the De Lery people and with Mr. Lockwood, and commenced to work the diggings on the River Gilbert. The books of the company show that up to this year they have taken out gold to the value of $705,540, but that out of this large amount they have obtained a net revenue of $18,682 only. The profits realized would, of course, have been very much larger, but for the unscientific method in which its works have been conducted. The management of the industry has been excessively extravagant, and the manner of the washing for gold very defective. Since the St. Ouge Company reopened the works on the Gilbert, several other individuals and companies have followed in the steps, amongst whom is an English company of capitalists, known as the Canada Gold Mining Co., and having at its head a gentleman of experience in Mr. J. N. Gordon. It is impossible to ascertain exactly the results of this company's operations. The President is not very ready to give information on this head, but is very much interested in the effort now being made at Ottawa, to have the Mining Act adopted at the last session of the Quebec Legislature, declared *ultra vires*. Mr. Gordon's pretension is that the legislation in question throws open to the public the rights which legally belong to his company, and which were purchased by them from the De Lery Co, to whom they were granted by patent from the Crown. The company employs about 100 men, and there are not wanting those who allege that its average find of gold is 10 ounces daily. This may be an exaggerated estimate, but it emanates from a practical miner. The Dinsworth Co. of New York employs 60 men and takes out an average of seven ounces per day. Mr. Bread employs 30 men and takes out about four ounces a day. Some distance to the right of where these companies operate, there is another stream called La Branche, a tributary of the Gilbert, upon which new works have been opened up, the principal parties interested in them being Messrs. De Lery, Chapman, Augers, Mathieu, Berube and Rodrigue. Thes works promise well. So do others, opened on the Du Loup river by Mr. Humphreys, representing Hon. Mr. Moreton, of the staff of His Excellency the Governor General. On the river Harbottle, Messrs. Beemer and Richards have discovered a vein which justifies very high expectations. On the Des Plantes, Mr. Mackenzie has commenced the washing of the bed of the river by hydraulic power, and the results obtained have been very satisfactory. On the same river, very good results are being obtained by another company, at the head of which are Messrs. Matthieu, Gonreau and Berube.

It appears that all is not gold that glitters. I have already reported seemingly very large finds of the precious metal on Mr. Ainsworth's lot, No. 13, Gilbert River, Beauce. It appears, however, that the cost of working this land is unusually heavy, and to this may perhaps be due the institution of actions at law for labor on the works during the past summer.

STADACONA.

PRESERVATION OF OUR FORESTS.

TO THE EDITOR OF THE LUMBERMAN.

SIR—I have just, for the first time, had a look through a number of the LUMBERMAN, and I must congratulate you on its appearance, and in the manner, in general, in which it is got up. The object it has in view is a very good one, and there is not the least doubt but those in whose interest it is published will value it for the information it contains. The want of such a journal has long been felt by the lumber trade and those connected with it, now since you have made such a very creditable commencement, I trust the enterprise will be liberally encouraged and your expectations fully realized.

I notice an article on the necessity of preserving shade trees—another on tree planting and tree culture—reference to shantymen's wages, the markets, and a general view of the trade. One of the most important of the above is the giving of correct market prices in the places mentioned, so that the trade in Canada can with confidence point to the LUMBERMAN as the proper authority.

How to preserve our forests, and how to renew them is certainly a most important subject for us in Canada. The renewing of the forests is a question that should occupy the attention of our local legislature at an early day. I see that the Kansas State legislature has taken steps in that direction. An Act has been passed enacting that any person who is the head of a family or who shall have arrived at the age of 21 years, and is a citizen of the United States, or who shall have filled his declaration of intention to become such, who shall plant, protect and keep in a healthy, growing condition for eight years, forty acres of timber, the trees thereon not being more than twelve feet apart each way on any quarter section of public lands of the State, shall at the expiration of eight years, be entitled to said lands, free from all State charges. If a person makes a purchase of 40 acres and plants ten acres, he will be entitled to the number of acres so planted—free.

Now, Mr. Editor, you will see the advisability of some such step being taken to start a system of keeping up our forests, when we have so much waste land, that some day should prove a mine of wealth to the country. In looking over the report of the progress of the State of Minnesota, I notice that in 1878 the State Legislature allowed for trees planted on the highways, $30,000; and I also find that in France alone in 1877, no less than 37 million feet of lumber was converted into toys. Under such immense consumption of timber in one country of the old world, how much greater the necessity for us to protect and renew our valuable but rapidly decreasing forests. I have extended this article rather larger than I intended, but if you consider it of sufficient importance, in my next I will give you my views on how to preserve our forests from fire, in the Free Grant Lands of Ontario and Quebec. Wishing you much success, I remain &c.,

A WATCHMAN ON THE TOWER.

Dec. 19th, 1880.

The Lion's Tongue.

(Land and Water.)

The very peculiar formation of the lion's tongue did not escape the notice of our anatomist, but he does not say much about it. I have now in my hand the dried tongue of a lion; it is covered with sharp-pointed horny papillæ, set very thickly upon its surface. The papillæ on the front portion of the tongue are much larger than those in the rear part of the tongue, but the smaller ones are set much closer together than those in front. Each papillæ consists of a horny spine, the point of which is curved and set directly backward, reminding me much of the spines on the tail of the thornback ray. On applying this lion's tounge to the cheek, I find that the roughness is so great that with a little pressure a wound might easily be made in the skin. The use of this is to scrape off the meat from the bones of the animals, for the lion is not a great bone-eater—he leaves the bones for the hyenas to crack, these animals having teeth especially constructed for the cracking of bones. This peculiar roughness of the tongue is also present, but in a less degree, in the common cat, and it can be seen when the cat is lapping milk, but still better if the tongue of a defunct specimen be taken out, put for a while in spirits, and then pinned out tight on a board. This rough tongue is of great importance to the health of the lion.

Timber Limits for Sale.

SEVERAL MOST VALUABLE TIMBER limits on North Shore of Lake Huron. For particulars apply to

THOS. SHORTISS,
Imperial Bank Building, Toronto.

LAUDER & THORNTON MFG. CO.
MANUFACTURERS OF

The Largest Oak in Great Britain.

In spite of a rival claim put forward in behalf of an oak in Newland in Gloucestershire, I believe that the largest oak in Britain—and our island home can boast of not a few giant oaks, many of them famous, too, for their historical associations—stands in the parish of Cowthorpe, three miles from Wetherby, in the west riding of the county of York. The Cowthorpe oak, whose age has been computed to exceed 1,500 years, has, as may be supposed from its extraordinary size, been noted in numerous works devoted to natural history and forestry. The circumference of its trunk close to the ground was, at the close of the last century, according to Evelyn's "Sylvia," 78 feet. Shortly after the publication of this work, earth was placed around the base of the trunk with a view to the preservatien of the trees, which by covering over some very considerable projections, reduced the girth of the stem at the ground line to 60 feet. In 1829, the Rev. Dr. Jessop measured the tree and communicated its dimensions to Strutt's "Sylvia Britanica." We transcribe the reverend doctor's details, which, he assures us, may be relied upon :

Circumference at the ground, 60 feet ; circumference at the height of one yard, 45 feet ; height of the tree in 1829, 45 feet ; extent of the principal remaining limb, 40 feet ; greatest circumference of ditto, eight feet.

Dr. Jessop adds : "The tree is hollow throughout to the top, and the groundplot inside (the amount of which has been much exaggerated) may possibly afford standing room for forty men." In Loudon's "Arboretum" the diameter of the hollow within the tree, close to the ground, is given as nine feet, ten inches. "The circle occupied by the Cowthorpe oak," says Professor Burnnet, "where the bottom of its trunk meets the earth, exceeds the ground-plot of that majestic column of which an oak is confessed to have been the prototype, namely, Smeaton's Eddystone Lighthouse." In Burnett's "Outlines of Botany" we also read: "So capacious is the hollow of the Cowthorpe oak that upwards of seventy persons have been, as the villagers affirm, at one time assembled in it." In the 12th volume of Loudon's Gardener's Magazine, the Cowthorpe oak is said to be undoubtedly the largest tree at present in England. Shaw, in his "Nature Displayed," says : "Many suppose the Cowthorpe oak to be the father of the forest ;" and in Kent's "Sylvan Sketches" (1825) mention is made of this oak as surpassing all others.

Tradition asserts that at one time the branches of this tree overshadowed half an acre of ground. A large branch which fell about the commencement of last century is said to have extended to a wall 90 feet from the trunk of the oak. On this wall, which still remains, the villagers, so the story runs, used to mount to pick the acorns from the overhanging branches. The leading or top branch fell before the date of any record concerning the tree. The manner in which it is said to have fallen is, however, remarkable. The main trunk having become hollow, the perpendicular shaft dropped down into the trunk and could never be removed. There it remained wedged in, doubtless tending to strengthen the hollow cylinder and prevent compression from the pressure of its enormous branches. In 1772 one of the side branches was thrown down in a violent gale of wind, and on being accurately measured was found to contain upwards of five tons of wood. The largest of the living branches at present extends over 40 feet north northeast from the trunk. This giant limb is supported by a substantial prop of timber.

A century ago Yorkshire children used to amuse themselves with a game called the "Dusty Miller." The Cowthorpe oak was a meeting place for this diversion. Through the rents in the shell of the trunk, then only large enough to admit them, troops of merry village lads and lasses crept into the interior, and, provided with a spout, which was balanced in a hole in the wall of their living playhouse, they gathered the dry, crumbling dust and fragments of wood and shot them down the spout to their companions outside. It has been reported that for some time the cavity within the tree was used as stabling for cattle, but this, we think, is fiction. The openings in the trunk, though evidently enlarging constantly, are even now scarcely wide enough to give color to this assertion.

In connection with this tree, an anecdote is related of that notable Yorkshireman, John Metcalfe, the blind highway contractor and surveyor, better known as "Blind Jack" of Knaresborough. Blind Jack was a frequent visitor to the tree, and would measure its girth correctly at any height within his reach, going round it with his long arms extended. He used to point out, too, with accuracy, by putting up his staff, to the exact spot from which the great branch had fallen. Whenever he came, an old bloodhound which was kept near the tree, whose wont was to snarl at every stranger, fondled him and licked his hand. Blind Jack now lies at rest in Spofforth churchyard, almost within the sight of the old oak.

So great was the fame of the Cowthorpe oak that formerly small saplings raised from its acorns were sold in pots to visitors by the villagers for as much as a guinea each. As the old oak now stands, it is a very picturesque object. It is situated in the centre of a small green paddock ; hard by is the little village church, a very ancient structure, and the clear waters of the winding Nidd glide noiselessly past. The battered trunk, annually crowned with green foliage, is grand in its venerable decay. The old tree has been termed "the glory of England and the pride of Yorkshire ;" and its enormous size, the growth of many centuries, entitles it to all the fame it has acquired.

Paper from Grass.

It has been discovered that any of th common grasses make a superior article, and a patent has been issued to the discoverer. The following is the process :

"The manufacture of paper pulp and paper from paper grass is one of the novelties for which a patent has been obtained. Any of the common grasses found in the field, lawn, or meadows, may be used, and it is said that the green grass pulp produced from them make a paper of great strength and length of fibre, and possesses tenacity, softness and flexibility ; and further, that this paper is even softer and more transparent than that made of linen. An advantage not to be overlooked is the one of economy, since one square foot gives in the whole year, 0.9 to 1.0 of a pound of green grass, making from 30,492 to 66,340 pounds to an acre. One pound of green grass makes one fourth to one-sixth of a pound of fine, bleached, finished paper, or 3,711 pounds of finished paper to the acre.

"So long as the sap is in circulation and the chlorophyl, silica, and other inorganic matters are not dried in, in which event the fibre is seriously impaired for the purpose of paper, either old or young grass may be used, but to avoid danger, it is best to have the grass cut or mown before it begins to bloom.

"The first process of manufacture is to pass the grass between the rollers of the press, which crushes or loosens the fibre and squeezes out most of the sap. It is then freed from dirt by being thoroughly agitated or washed by other means in a large tank of water, in temperature either warm or cold. A perforated false bottom in the tank contains the grass and allows the dirt to fall into the compartment below, where a pipe gives egress to the dirt and wash water. After sufficient washing the crushed grass is boiled in an open kettle, or in a steam kettle with lye, in a proportion of a pound of caustic soda, or two tenths of a pound of caustic potash, or six-tenths of lime. to 100 pounds of grass. With an open kettle the boiling is continued from four to five hours ; with a steam kettle two hours will suffice.

"From the kettle the material goes into a filtering trough of magnesia for about thirty minutes, then is placed a second time in the solution of sulphuric acid. These operations may be repeated more or less, till the pulp is as fine and white as required, after which it is washed in clear water."

Another method is to filter the crushed pulp with water glass, and bleach it with a solution of chloride of lime or chloride of soda. Still another is to bleach the crude pulp in chlorine gas, and finish with waterglass, after which the pulp is washed with clean water.

As we were talking one day about churches and their curious ceremonies, a little boy remarked that he had seen a christening, a funeral, and a wedding, but he had never seen a divorce.

MR. LONGFELLOW can take a worthless sheet of paper and by writing a poem on it make it worth $50. That's genuis. Mr. Vanderbilt can write fewer words on a similar a sheet and make it worth $50,000,000. That's capital.

A Great Invention.

A man living near Bloomfield, N. J., has contrived an arrangement, says the New York *Sun*, by the use of which he is enabled to get an hour or more of extra sleep in the morning, and in other ways he finds it of great benefit. In many ways it takes the place of a domestic servant. The gentleman has thought out and put into practical working an idea that occurred to him a year ago. He is awakened in the morning by a shrill whistle. He at once gets out of bed, for he knows what that whistle means. It tells him that all is ready for him to get breakfast. He dresses and goes into the kitchen, and there he finds a bright, fresh fire, a tea kettle full of boiling water, and other conveniences for preparing his morning meal. All this is accomplished by means of an alarm-clock with weights, a piece of wire, a sheet of sandpaper, and some matches. Paper, wood, and coal are put into the grate of his cooking-stove, and a tea kettle filled with water, and having a tiny whistle fitted into the nozzle of the kettle, is placed on the stove. By setting the alarm in the clock he can have a fire at any time he wishes. When the alarm in the clock goes off, a weight falls and hits the wire ; the wire moves and scrapes the matches fastened to it on the sandpaper ; the matches light the paper in the stove, the paper fires the wood and coal, and soon a fire is under way. In a little while the water in the teakettle boils, and then the tiny whistle gives the note of warning that everything is ready and it is time to get up.

"Simple thing, and yet what a comfort it is," the inventor says. "There is no getting up for me now an hour before breakfast, losing that amount of sleep, and then waiting around for breakfast. The arrangement costs next to nothing, and it is as trustworthy as anything in this world. I have not had it patented yet. Some persons advise me to, and perhaps I may. I haven't any for sale ; get it up entirely for my own comfort and convenience, and it has more than repaid me already. But just think, if it were in general use it would save many hard words and do away with considerable domestic unhappiness among poor people. Doubtless it might have a tendency to make a better feeling between some men and their wives, by settling the vexing question as to who should get up in the morning and build the fire. Out of this question alone many divorce suits grow, and this arrangement would prevent them."

One Hundred Bushels of Shelled Corn to the Acre.

Mr. Nathan G. Pierce tells the *American Cultivator* how he raised 100 bushels of shelled corn to the acre, having accomplished that feat for the second time this year. He uses for seed an eight-rowed corn which he has improved by careful selection, and believes it to be a good variety to raise in that locality, or, in fact, anywhere between Virginia and the Canada line, or east of the Alleghany Mountains.

The ground selected for planting was a good piece of gravelly loam. It was well ploughed last spring, about the first of May, harrowed, treated to a broadcast application of 900 pounds fertilizer to the acre ; again harrowed faithfully, rendering the land fine and mellow ; rows marked three feet apart, a small amount of fertilizer scattered to each row. May 10th, three kernels of corn planted in each hill, two feet apart in the rows ; cultivated and hoed four times, allowing no weeds to grow ; passed through the entire piece, cutting each hill down to two stalks ; every sucker in each hill cut throughout the field.

During the entire period of growth through the season the field was closely watched, every weed pulled and every ear of smut cut out. At the proper time, after the corn has become hard, it was cut, bound in bundles, and stooked. When dry it was drawn into the barn, where, with the assistance of a hired man, the corn was husked, weighed as husked, and found to yield 100 bushels to the acre, allowing seventy-five pounds of ears to equal one bushel of shelled corn.

GOLDWIN SMITH, in the five years of his Oxford University course, won the Hertford, the Ireland, a first in "Greats," the Latin verse, the Latin essay, the English essay, and to crown all, a fellowship of the University. He remained an Oxford man for twenty years, and in 1858 was made by Earl Derby Regius Professor of ModernHistory, with a salary of £650 a year.

Some Strangely Fulfilled Dreams.

Dickens once had a dream which was fulfilled, at least to his own satisfcation. "Here," he wrote on May 30, 1863, "is a curious case at first hand. On Thursday night last week, being at the office here," in London, "I dreamed that I saw a lady in a red shawl with her back toward me, whom I supposed to be E. On her turning round I found that I didn't know her, and she said, 'I am Miss Napier.' All the time I was dressing next morning I thought, 'What a preposterous thing to have so very distinct a dream about nothing?' And why Miss Napier? for I never heard of any Miss Napier. That same Friday night I read. After the reading came into my retiring-room Mary Boyle and her brother, and the lady in the red shawl, whom they presented as 'Miss Napier" These are all the circumstances exactly told." This was probably a case of unconscious cerebration. Dickens had no doubt really seen the lady, and been told that she was Miss Napier, when his attention was occupied with other matters. There would be nothing unusual in his dreaming about a person whom he had thus seen without noticing. Of course it was an old coincidence that the lady of whom he had thus dreamed should be introdnced to him soon after—possibly the very day after. But such coincidences are not infrequent. To suppose that Dickens had been specially warned in a dream about so unimportant a matter as his introduction to Miss Napier would be absurd ; for, fulfilled or unfulfilled, the dream was, as Dickens himself described it, a very distinct dream about nothing. Far different in this respect was the strange dream which President Lincoln had the night before he was shot. If the story was truly told by Mr. Stanton to Dickens, the case is one of the most curious on record. Dickens teld it thus in a letter to John Foster : "On the afternoon of the day on which the President was shot there was a Cabinet council, at which he presided. Mr. Stanton, being at the time Commander-in-Chief of the Northern troops that were concentrated about here, arrived rather late. Indeed, they were waiting for him, and on his entering the room the President broke off in something he was saying, and remarked, 'Let us proceed to business, gentlemen.' Mr. Stanton then noticed with surprise that the President sat with an air of dignity in his chair, instead of lolling about in the most ungainly attitudes, as his invariable custom was; and that instead of telling irrelevant and questionable stories, he was grave and calm, and quite a different man. Mr. Stanton, on leaving the council with the Attorney-General, said to him, "That is the most satisfactory Cabinet meeting I have attended for many a long day. What an extraordinary change in Mr. Lincoln !" The Attorney-General replied, 'We all saw it before you came in. While we were waiting for you, he said, with his chin down on his breast, "Gentlemen, something very extraordinary is going to happen, and that very soon."' To which the Attorney-General had observed, 'something good, Sir, I hope?' when the President answered very gravely, 'I don't know—I don't know. But it will happen, and shortly, too.' As they were all impressed by his manner, the Attorney-General took him up again. 'Have you received any information, Sir, not yet disclosed to us?' 'No,' answered the President, 'But I have had a dream. And I have now had the same dream three times. Once on the night preceeding the battle of Bull's Run. Once on the night preceding such another,' (naming a battle also not favorable to the North.) His chin sank on his breast again, and he sat reflecting. 'Might one ask the nature of this dream, Sir?' said the Attorney-General. 'Well,' replied the President without lifting his head or changing his attitude, 'I am on a great broad rolling river—and I am in a boat—and I drift ! and I drift !—but this is not business,'—suddenly raising his face and looking round the table as Mr. Stanton entered—'let us proceed to business, gentlemen.' Mr. Stanton and the Attorney-General said, as they walked on together, it would be curious to notice whether anything ensued on this, and they agreed to notice. He was shot that night."

When John Skeil of Hickory township, Pa., met a snake in the woods that was eight feet in length, he became charmed, and found it impossible to remove his eyes from the dazzling orbs of the monster. Finally he became unconscious and fell to the ground. The snake immediately coiled himself about the body, but the arrival of Mr. Skeil's son saved his life. The reptile was shot, but Skeil lies at home in a very critical condition.

Irish Woes.

A MEMBER OF PARLIAMENT'S ACCOUNTS—THE STORY OF NORAH GOLDEN.

Mr. Charles Russel, M. P. for Dundalk, is writing, in letters to the London *Telegraph*, his observations in portions of southern Ireland. In county Kerry there has been less suffering than elsewhere, and until recently the Land League had not made it the scene of active operations. Yet Mr. Russel paints a dismal picture of its condition. Poor land, high rents, and gaunt, half-naked people were the rule everywhere. But perhaps a more vivid idea of the actual state of things will be gathered from the following story of a sufferer which he reports. He writes as follows:—

Several stories of hard treatment were told us. I will give one with name and address, as the poor woman having been evicted from her holding it is beyond the power of my narrative to injure her further. Apparently she was aged about sixty-five years, and if ever a woman spoke with a sense of wrong upon her, Norah Golden did. It would seem that the land had been transferred from her name to that of her son. "I have held a farm at Roads for forty-two years. I have been twenty-two years a widow. I had the grass of four cows under Morrough Bernard. The rent, eighteen years ago, was £6 15s. It was then raised to £11 4s. Three years ago it was raised to £12 13s. 4d. Griffith's valuation is £5 14s. We owed a year's rent on the 1st of May, 1879, and a decree was got against us last November. We were turned out on March 25th last, the day of the annunciation. While I was at mass they broke in my door. It was locked, and they put my furniture on the side of the road. Last November fair my son John offered half a year's rent, and was refused unless I paid £2 10s. for costs. My son went in again to see if he would take it, but he was refused. My son, out of heart, went to America, and the rent we offered, and £3 10s., which I borrowed, went to pay his passage to America. His wife and six children are in Cahisciveen with me. The eldest of his children is only nine years, and the youngest two months. My son has sent me over since he went £6 from America. I saw the landlord myself. It was in his new married time. I laid £10 before his honour, but

HE REFUSED,

saying I was ejected, and he could not make a tenant of me for six months. I went to him the next day and he gave me the same answer. I followed him into the street, and I had a mind to curse him, as he would not give me the land for my son and large family. I made up the £10 by selling a young springer, and I borrowed 30s. from a shopkeeper in this town, John Dennehy, and I sold a new milch cow for £7 10s. The sheriff's expenses, with £12 13s. 4d. for the rent, made up the money to £15 7s. To-day (18th September) three weeks I sent a bank draft for £15 7s. to Morrough Bernard, at Killarney, and it came back to me by his driver, Morris Collins, the next Wednesday. When I opened the letter the draft was in it. Charley Clifford read the letter for me, and said that it told me to go to Downing, Tralee (Morrough Bernard's solicitor), and if I settled with him I would get possession again. I walked the next day to Tralee, every step of the way, forty miles, until I made out Downing's office. I reached him my letter, and he said it was of no value to him. He asked me had I money, and I said I had the redeeming of the land with me. He said, 'I can do nothing for you, my poor woman.' I did not get a letter from Morrough Bernard this length of time. I began to cry to think they would make an ape of me, sending me so far. I went again last Thursday fortnight to Tralee, and remained there five days. I went then to Mr. Broderick, an attorney who bears the best name of doing good to the poor in the country. I told him that when my son got married I got his name put down for the rent. Mr. Broderick said he had no other case but mine in Killarney, and that he could not go down for my case unless I paid him £3 10s., but I had only £1. I do not think Mr. Bernard will

PUT ME BACK ON THE LAND.

My son drained and fenced the land, and put a road on it. He made more improvements on it than his father did before him. My son said to Morrough Bernard, when he brought him the rent, that he improved every inch of the land himself. There was a field on it eighty spades long and fifty spades in breadth (a spade is 5½ feet) that man never worked till my son drained it, and now it is covered with oats. In the old time water would have got in on it over a man's knee boots. There is another field thirty-two spades long, and my son drained it, and now it is in tillage. The oats taken out of my garden now is worth 1s. 4d, a barth (a barth means twenty sheaves). My potato seed was long in the ground when we were put out. The landlord was here on the eighth of August last, and he took a foreign road so that he might not meet me, the way I could not redeem my land. He knew I was in town. He said when I offered him the £10 I was not the tenant at all; that the land was in my son's name. He never gave a lease on the property, nor his father before him. Nearly all his tenants got relief from the parish priest during the last winter. The rent, I believe, was raised on all the other tenants, same as when it was raised on me." I leave the story to speak for itself.

THE HOUSEKEEPER.

SISTER MAG'S CAKE.—Two and a half cups of powdered sugar, three-fourths cup of butter, one cup sweet milk, three cups flour, four eggs, one lemon, juice and rind, one small tablespoonful soda; bake in a square or oblong tin, and frost with whites of two eggs beaten stiff with powdered sugar.

FRICASSEE OF HARICOT BEANS.—One pint of beans, three ounces of butter, the juice of one lemon, and one ounce of parsley. Steep the beans two hours in cold soft water, adding a saltspoonful of salt and one ounce of butter. When they boil, simmer them shortly two hours or more; put them into a stewpan with a little pepper, salt, chopped parsley, two ounces of butter and the lemon juice. Sit them on the fire a few minutes and stir them well.

LENTIL SOUP,—One quart of lentils, two pounds and a half of parsnips, two pounds of celery, two ounces of eschalots or leeks, one ounce of chopped parsley, and two ounces of butter. Wash and pick the lentils, steep them twenty-four hours in soft water, set them on the fire in four quarts of spring water, add the vegetables and some salt, boil till quite soft, rub through a fine colander or coarse sieve, adding boiling water as required; return it to the pan, season with pepper and salt, stir in the butter and boil a few minutes.

EGGS OF THE RISING SUN.—Boil six eggs ten minutes, remove the shells and cut each egg in halves lengthways; take the yolks out and pass them through a wire sieve on a dish; shred the whites into fine strips, and put these in white sauce, made as follows: one pint of milk thickened with flour in the same way as for butter sauce, add two teaspoonfuls of chopped parsley, a little cayenne, nutmeg, and salt, and a small piece of fresh butter; mix well together, and dish up, with the yolks on top; brush over with a little clarified butter; to be put in a moderate oven until slightly browned.

CHEESE AND MACARONI.—Quarter of a pound of cheese, two ounces of macaroni, and half a teacupful of cream. Wash the macaroni, and let it steep half an hour in cold spring water; cover with a plate and set in a moderate oven, or on a stove, till the macaroni is tender but not soft; drain in a colander, and put it on a dish with a little butter, salt, and white pepper, adding the cream; cover it with good toasting cheese, cut in thin slices, without crust; sit it in the oven, and if not lightly browned in ten minutes, set it in a Dutch oven before the fire for one or two minutes.

MINCE-MEAT FOR PIES.—Shred and chop very fine two pounds of beef suet; by dredging the suet occasionally with flour it chops more easily and does not clog; boil slowly, but thoroughly two pounds of lean round of beef and chop fine, (mix all the ingredients as they are prepared;) stone and cut fine two pounds of rasins; wash and pick two pounds of currants; cut fine half a pound of citron; chop two pounds of apples, weighing them after they have been peeled and cored; a tablespoonful of salt, a teaspoonful of ground cinnamon, a grated nutmeg, a saltspoonful of allspice, half as much cloves, two ounces of rose-water, half an ounce of essence of almonds, half a pint of brandy, and a quart of cider. This may be kept in a cool place all Winter. If too dry add more cider.

THE death was lately announced of Gen. Low, son of Sir Hudson, Napoleon's custodian at St. Helena, whose wife was one of the New York De Lancys.

Suggestions About Saws.

The cause of saws heating at the centre is almost invariably the heating of the mandrel, or the collars not being properly turned; and sometimes the saw may not be in proper line, with the carriage, or the track out of order. Saws heating at the rim and not in the centre is generally the result of the saw leading too much into the log, causing it to bear too hard against the outside guide. Often the machinist in putting in the log pins of a mandrel will turn them too large, then drive them into the collar with a hammer and swell the metal around the pins without noticing the defect. In such a case the saw will only have a bearing at a small surface around the pins and never fit or hang true until the metal is chipped or filed off level with the face of the collar. Often the collars will not run true; this defect should be corrected at once.

Where very thin saws are used solid toothed saws are recommended by Emerson for two important reasons. A thin saw requires more teeth, in order to do a given amount of work, because the teeth are not so stiff as those of a thicker saw and therefore more liable to spring sideways and follow the grain of the timber. Another reason is that sawyers generally have had more experience with solid saws than with inserted toothed saws and consequently, and having more confidence will persevere and make them go under ordinary difficulties, when they might condemn an inserted tooth under similar circumstances.

In the use of the emery wheel proper care should be exercised, for there is more danger from their use than either the file or a burr gummer. If the condition of the saw is such that a considerable depth is required to be cut in the plate, the operation should be performed by going over the saw several times, only allowing the wheel to grind away as much as can be done without heating the saw to a blue. There is no excuse whatever for crowding the emery wheel so as to heat the saw red hot, as this is sure to injure the saw, often glazing it, where the wheel comes in contact so hard that a file will make no impression whatever. From these hard spots on the outer surface small cracks commence, invisible at first to the eye, but gradually enlarging until they become dangerous fractures. Hacking the face of the wheel with a cold chisel, or the corners of an old file, will often prevent its glazing so that it is not as liable to heat the saw. After a few times gumming, however, the saw will enlarge on the rim so that the slightest warmth will cause it to buckle, and there is no remedy left but to send it to a saw maker and have it re-hammered. Some, however, entertain the erroneous impression that a saw re-hammered will never run as well as when new. On the contrary, a saw re-hammered will generally run better than when new, because all the elasticity (or nearly all) is worked out of the saw by using, and it generally works stiffer than when new.

Civilian Combatants.

Sir Donald Stewart (a correspondent writes to us) is reported to have expressed his surprise at a meeting held recently at Simla at finding a Roman Catholic chaplain in the fighting line of a British regiment during an engegement; and to have mentioned how he had also on another occasion seen a chaplain with voice and walking-stick rally some scattered cavalry. Snch things have been known before in our military history; and indeed some of the early bishops, clad in mail and armed with the mace which drew little or no blood, did considerable execution in the hostile ranks. Civilian or ecclesiastical combatants, however, are rarely suffered upon a modern battle-field; though, even so late as the Russo-Turkish war, a chimney-pot has been detected in the midst of the fray. At Waterloo, as the Enniskillen dragoons prepared to charge the French columns, an excited rider in "mufti," posted on their left, accompanied by a pale lad with bandaged face, and one arm in a sling, shouted to them, "Now's your time!" This was Wellington's friend, Charles, fourth duke of Richmond, who, with his son, Lord William Lennox, was for a long time in the thickest of the fight on that great day. At the Berlin manœuvres last month one of her majesty's chaplains was a conspicuous figure at every one of the mimic encounters, his clerical garb being relieved by a pair of servicable brown shooting-gaiters.

"MISSIONARY teas" are very popular. The gossip is confined exclusively to people in foreign parts, and is harmless.

ROYAL AND NOTABLE PEOPLE

THE Prince of Wales rides about a great deal in a private hansom cab, which has many comfortable improvements. Among these is a travelling clock with a luminous dial-face set in the centre of the splash-board.

WHEN the Duke and Duchess of Connaught were visiting Hampstead, their plain carriage passed unobserved through the crowds that had assembled to greet them; but when the gay turnout of the sheriff appeared, the air was rent with cheers, much to the amusement of all in the secret, who then saw what the populace expect of royalty.

MISS EDMONIA LEWIS, the sculptor, who is of mixed African and Indian parentage, has had a more than common measure of success in her profession. The Pope long since visited her studio, and blessed her work; the Marquis of Bute bought one of her groups for an altarpiece; and another, the "Old Arrow-maker and his daughter," was bought by Lady Ashburton.

IN Sir Robert Peel's strong Government of 1841 there were three Scotchmen. At one time Scotland sent Macaulay, Campbell, Hume, and Fox Maule to the House of Commons. Now, except Mr. Gladstone, the only contingent of political intelligence which Scotland, with its dominant liberalism, contributed at the last election was Mr. Trevelyan, Grant Duff, and Dr. Playfair.

WHILE riding out on horseback at Milan, recently, King Humbert passed a peasant driver who, at the moment, fell from his seat between his horses' heels and the wheels of his wagon. The King leaped from his horse, snatched the peasant frem his perilous position, but not before the wheels had crushed him fatally. His family will be hereafter taken care of by the King.

WHEN the court of Victor Emmanuel was transported from Turin to Florence, in 1864, the Marquis de Breme was master of ceremonies, and a very severe one. To Prime Minister Ricasoli he prescribed a court dress before he could be received by the King. Ricasoli replied: "Either I must be received in a plain frock-coat or not at all. The Ricasolis have never worn livery of any kind."

ONE of General Garfield's closest friends is Major Swaim, who is spoken of as likely to be his private secretary. He is a compactly built man, about fifty, square-shouldered and deep-chested. At first he appears brusque, but this disappears on acquaintance, and he becomes very companionable. He is an Ohio man, has seen much of the world, and is a very good judge of men. General G. is said to rely greatly upon his judgment.

THE Carthusian Fathers, who have recently established themselves in Sussex, England, on a large scale, are in treaty with the Duke of Norfolk for his estate near Horsham, which is at a short distance from their enormous menastery at Cowfold. The price offered is said to be considerably under $150,000, although the property is worth a good deal more; but it is supposed that the Duke is willing to make a sacrifice in favour os those whom he considers martyrs.

PRINCE ROLAND BONAPARTE, son of Pierre Napoleon, and Mlle. Maria Blanc, daughter of the late *entrepreneur* of the Monaco gaming-house, have decided to leave Ermenonville, the little village near Senlis, where they were to spend their honeymoon, and are thinking of visiting the Florentine palace of San Donato, with which the bride was presented on her wedding day. They will stay for a short time at Nice, where the fashionable world is now beginning to assemble. There is much curiosity to see the heiress in the vicinity of Monte Carlo.

ONE of the Empress of Austria's brothers, Charles Theodor, Duke in Bavaria, has successfully passed the examinations qualifying him to practise as an oculist. His first operation for cataract, performed upon a citizen of Dresden shortly after he had obtained his diploma, resulted in the complete restoration of sight to his patient; and he has again operated with entire success upon a sufferer from cataract in the Munich Hospital. The Prince is a regular attendant at Prof. Arit's lectures on diseases of the eye, and has in no respect relaxed the arduousness of his studies since he became a regularly licensed member of the faculty. If report speak truly, Dr. Charles Theodor is fairly on the way to attain high rank among the more eminent practical oculists of southern Germany.

MARKET REPORTS.

CANADA LUMBERMAN OFFICE,
TORONTO, 29th Dec. 1880.

During the holidays there has been a lull in lumber yards. Builders are clearing up old stocks to commence the business of the new year, of which the prospect is good. Stocks generally are light throughout Western Canada. The town of St. Thomas has probably the best supply on hand of any of our Western towns. At the mills stocks are moderate and nearly all sold. Shippers are getting supplies in according to demand. The Northern Railway has made liberal concessions to parties holding stock along the line, increasing the local car load to 12 ton and through to 13 tons, the standard on the Midland is 10 and 12 tons respectively. At Albany, New York, and other cities across the lines a fair business is going on, with a prospect of greatly reduced stocks by spring. In our logging camps all is bustle and activity, and so far the progress is all that could be desired.

Manufacturers, 61 King Street East, Toronto.

CAUTION—As there are worthless imitations being sold under different names the public are cautioned against buying any but "Pim's Royal Printograph," as none but those bearing our name are genuine.

SAVE YOUR COAL

J. W. ELLIOT'S

PATENT SAVER.

The First Object—Is to produce the greatest amount of heat from a given amount of fuel, and is gained by an arrangement of the three way draft passage and some twelve feet of flue pipe, which is beat down and around the base, and the heat is absorbed by the atmosphere through direct radiation from every part of the stove. Another object of the invention is to secure for heating purposes the greatest possible benefit of the fire contained in the stove, and is accomplished by placing around the body of the stove a series of internally projecting pockets overlapping the fire pot, and so formed that the air of the room is admitted into the lower end of the pockets, and, after passing through them, re-enters the room, having become intensely heated through contact with the inner sides of the said pockets, which are immediately over the hottest part of the fire, thereby producing far greater results from a given amount of fuel than any other stove. *Second Object*—An evaporator which is a part of the stove. The cover becomes a water tank, and is an effective evaporator; the pivot on which it turns is an iron tube screwed into the base of the tank, while the lower end is closed and rests in a pocket inside the dome, thereby producing a greater or less amount of vapor in proportion to the intensity of the heat. *Third Object*—There is a double heater, by means of which heat can be conveyed to an apartment above, and supplied with sufficient vapor from the tank. *Fourth Object*—A combined hot air and steam bath can be obtained by closing the damper in the water tank, and causing all the vapor to mingle with the ascending heat. *Fifth Object*—

The Stove becomes Simplified and easy to Contro

All hinged doors and objectionable fittings are abandoned, and are replaced by mica lights with metal tips attached, by means of which the mica may be sprung into place, or removed and cleaned with a dry cloth, or replaced when the stove is red hot, without burning one's fingers At the base of the mica lights eyelets are placed, through which a constant flow of air causes all the gas or smoke to be consumed or to pass off. *Sixth Object*—A base plate of cast iron in the place of zinc or other perishable material. The base plate is raised sufficient for the cold air on the floor to pass up through its raised and hollow cone-shape to the stove, and is rarified, and by this means a constant circulation is continued until an even summer heat is obtained. The circulation above described causes the floor to remain cool underneath the stove. The stoves are altogether cast iron; and the slow consumption of fuel, the direct radiation from all its heated surface, ensures them to last any number of years and to produce no clinkers or waste.

There are two grates, similar in form to the base of a circular basket; the centre grate is rotated to the right or left by the lever a short distance, and by moving the lever still further to the right or left both grates are worked.

To light a fire close all the drafts in the base of the stove open a direct draft in the smoke flue; fill up to the base a the feeder with fine coal, leaving sufficient space for draft, on the coal place the lightwood, leave the tank cover off slightly for draft, until the fire has taken, close the tank cover and open the draft in front.

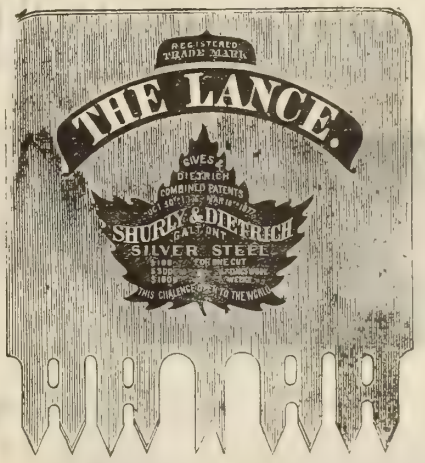
THE GENUINE

Silver-Steel, Lance-Tooth Cross-Cut Saw!



It stands without a rival. and is the fastest cutting saw in the world. It has beaten the best Canadian and American-made saws 33½ per cent. in every contest. Its superiority consists of its excellent temper. It is tempered under the Secret Chemical Process, which toughens and refines the steel. It gives a finer and keener cutting edge, and will hold it twice as long as any other process. We have the sole right for this process for the Dominion of Canada.

None genuine that are not like the above cut, with registered trade mark with the word "The Lance," and Maple Leaf with our name. Price $1 per foot.

CAUTION. — Beware of Counterfeits. There are inferior counterfeits on the market, which are intended to be sold at a high price upon the reputation of this saw. We will send to any address a saw exactly like any counterfeit, warranted equal in quality or no sale, at 60c. per foot. Therefore do not be humbugged into paying a first-class price for a second-class saw. A fact to bear in mind is that if the material and temper are not of the very best quality the shape of the teeth amounts to nothing. A saw, like a knife, will not cut fast without it will hold a keen, cutting edge. We have cut off a 14-inch sound basswood log in eight seconds with this saw.

Manufactured only by

SHURLY & DIETRICH.

E. COSMAN, - - Proprietor.

Terms, $1.00 to $1.50 per day.

THE RUSSELL HOUSE,

OTTAWA,

JAS. A. GOUIN, - - Proprietor.

IS THE

Favourite Resort of the Leading Public men of the Dominion attending the annual Sessions of Parliament.

Ministers of the Crown, Senators, Members of Parliament, Public Officials, as well as those having business with the various Departments of the Government. It is also the head-quarters of those having dealings with the princely Lumber Manufacturers in the great Pine Valley, of which Ottawa is the acknowledged centre.

THE RUSSELL HOUSE being central, almost abutting on the magnificent PARLIAMENT and DEPARTMENTAL BUILDINGS—the pride of the Country—is thus conveniently situated for those visiting the City on public business. But the location is also everything that could be desired alike for the man of business and the man of pleasure. A few minutes walk brings the guest of the Hotel within reach, not only of all the principal business resorts, but also of the most splendid Mountain and Valley Scenery that can be seen anywhere, as also of the two almost unrivalled Waterfalls—the Chaudiere and Rideau—and of the extensive Manufacturing Establishments and Depots of the leading Lumbermen. But, besides the beautiful scenery, which, it may be mentioned, includes the magnificent Ottawa and two of its grand tributaries—the Rideau and the Gatineau—there are in the immediate neighborhood, beautiful Lakes and apparently never-ending woods, which afford opportunities for the finest Fishing and Shooting that can be obtained on the Continent.

THE RUSSELL HOUSE affords excellent accomodation for 300 guests; its table is abundantly supplied with Viands of the choicest description, in season, and nothing is left undone to make every visitor feel comfortably "at home."

☞ Omnibusses meet the Arrival of every Train and Boat.

MACHINERY OILS!

To Dealers and Consumers.

STOCK OLEVINE, Equals Castor Oil, and Warranted not to Gum.

STOCK OLEVINE Equals Castor Oil, and Warranted not to Gum.

It will give the subscriber much pleasure to forward, post free, to any address, on application, a pamphlet, containing instructions and information that have been found of the greatest practical use to dealers and consumers of machinery oil in Canada. It contains the fullest information as to the different kinds of oils, their qualities and uses, thus enabling the consumer to make choice of the very oil best adapted to his wants, and also enables the merchant to select the kinds most likely to be in demand in his neighborhood. This pamphlet shows conclusively that oils properly manufactured from petroleum, are vastly superior to any *animal* or *vegetable* oil. I am now making the same qualities of "Extra" and "XX" oils I manufactured from 1870 to 1878. They are *guaranteed not to thicken with extreme cold*, and warranted to give satisfaction in every particular. Beware of Agents soliciting your orders without my trade-marked order-book. Address

*In examining the table it must be borne in mind that it relates only to business done in Canada. This comprises the *whole* of the business done by the local companies, but only the Canadian business of the British and American Companies. The Ætna's total income was **$4,350,897.30** in 1879.

☞ Of the $131,883 of "Policies become claims" in the case of the ÆTNA LIFE, **$53,764** was by the maturity of Endowment Policies—*i.e.*, policies payable at death or the end of 10, 15 or 20 years if living. In the other 19 companies, all combined, only a total of $24,948 of this excellent kind of insurance was paid in 1879.

$36,000 was added by the ÆTNA LIFE, the past year, to its Government Deposit, making it the largest of any Company, and nearly 4 times that of most Canadian Companies.

☞ The superior standing of the ÆTNA LIFE is shewn by its total income being **$4,350,897.30**, and by its Canada Branch income being nearly equal to the combined premium income of the whole 9 British Companies, or that of the 3 lesser American Companies, or that of all the Canadian Companies but one. This one has been 32 years getting $536,293, while the Ætna's $307,847 has grown from less than $1000 in the past 14 years.

THE CARE OF STEAM BOILERS.

The following is from a sheet of instructions to boiler attendants recently issued by the Manchester Steam Users' Association:

GETTING UP STEAM.—Warm the boiler gradually. Do not get up steam from cold water in less than six hours. If possible, light the fires overnight. Nothing turns a new boiler into an old one sooner than getting up steam too quickly. It hogs the furnace tubes, leads to grooving, strains the end plates, and sometimes rips the ring seams of rivets at the bottom of the shell.

FIRING.—Fire regularly.—After firing open the ventilating grid in the door for a minute or so. Keep the bars covered right up to the bridge. Keep as thick a fire as the quality of the coal will allow. Do not rouse the fires with a rake. Should the coal cake together, run a slicer in on top of the bars and gently break up the burning mass. It has been found by repeated trials that under ordinarily fair conditions no smoke need be made with careful hand firing.

CLEANING FIRES AND SLACKING ASHES.—Clean the fires as often as the clinker renders it necessary. Do not slack the clinkers and ashes on the flooring plates in front of the boiler, but draw them directly into an iron barrow and wheel them away.

FEED WATER SUPPLY.—Set the feed valve so as to give a constant supply, and keep the water up to the height indicated by the water level pointer. There is no economy in keeping a great depth of water over the furnace crowns, while the steam space is reduced thereby, and thus the boiler rendered more liable to prime. Nor is there any economy in keeping a very little water over the furnace crowns, while the furnaces are thereby rendered more liable to be laid bare.

GLASS WATER GAUGES AND FLOATS.—Blow through the test tap at the bottom of the gruge hourly, as well as through the tap in the bottom neck, and the tap in the top neck twice daily. These taps should be blown through more frequently when the water is sedimentary, and whenever the movement of the water in the glass is at all sluggish. Should either of thoroughfares become choked, clean them out with a wire. Work the floats up and down by hand three or four times a day to see that they are quite free. Always test the glass water gauges and the floats thoroughly the first thing in the morning before firing up.

BLOW-OUT TAPS AND SCUM TAPS.—Open the blow-out tap in the morning before the engine is started, and at dinner time when the engine is at rest. Open the scum tap when the engine is running, before breakfast, before dinner, and after dinner. If the water be sedimentary, run down half an inch of water at each blowing. If nots edimentary, merely turn the taps round. See that the water if at the height indicated by the water level pointer at the time of opening the scum tap. Do not neglect blowing out for a single day, even thongh anti-incrustation compositions are put into the boiler.

SAFETY VALVES.—Lift each safety valve by hand in the morning before setting to work and see that it is free. If there is a low water safety valve, test it occasionally by lowering the water level to see that the valve begins to blow at the right point, When the boiler is laid off, examine the float and level to see that they are free, and that they give the valve the full rise. If safety valves are allowed to go to sleep, they may get set fast.

SHORTNESS OF WATER.—In case the boiler should be found to be short of water, draw the fires if practicable, and draw them quickly, beginning at the front. In some cases it may be more convenient to smother the fires with ashes or with anything else ready to hand. If the fires are not drawn leave the furnace doors open, turn on the feed, lower the dampers, shut down the stop valve if the boiler be one of a series, and relieve the weight on the safety valves so as to blow off the steam. Warn passers-by from the front of the boiler.

USE OF ANTI-INCRUSTATION COMPOSITIONS.—Do not use any of these without a thorough knowledge of their effects. If used never introduce them in heavy charges at the man hole, or safety valve, but in small daily quantites along with the feed water.

EMPTYING THE BOILER.—Do not empty the boiler under steam pressure, but cool it down with the water in; then open the blow-out tap and let the water pour out. To quicken the cooling the damper may be left open, and the steam blown oft through the safety valves. Do not on any account dash cold water on to the hot plates. But in cases of emergency, pour cold water in before the hot water is let out, and mix the two together so as to cool the boiler down gradually and generally, and not suddenly and locally.

CLEANING OUT THE BOILER.—Clean out the boiler at least every two months, and oftener if the water be sedimentary. Remove all the scale and sediment as well as the flue dust and soot. Show the scale and sediment to the manager. Pass through the flues, and see not only that all the soot and flue dust have been removed, but that the plates have been well brushed. Also see whether the flues are damp or dry, and if damp find out the cause. Further, see that the thoroughfares in the glass water gauges and in the blow-out elbow pipes, as well as the thoroughfares and the perforations in the internal feed dispersion pipe and the scum pipes are free. Take the feed pipe and scum troughs out of the boiler if necessary to clean them thoroughly. Take the taps and the feed valves to pieces; examine, clean, and grease them, and if necessary grind them in with a little fine sand. Examine the fusible plugs. Do not put any blocks under the pipes in the hearth pit.

PREPARATION FOR INSPECTION.—Have the boiler cooled and carefully cleaned out as explained above. Show both scale and sediment to the inspector, as well as the old cap of the fusible plug, and tell him of any defects that may have manifested themselves in working, or of any repairs or alterations that may have been made since the last examination.

FUSIBLE PLUGS.—Keep these free from soot on the fire side, and from incrustation on the water side. Change the fusible metal once every year, at the time for preparing for annual examination.

GENERAL KEEPING OF BOILER.—Polish up the brass and other bright work in the fittings. Sweep up the flooring plate frequently. Keep water out of the hearth pit below the flooring plates. Keep the space on the top of the boiler free, and brush it down once or twice a week. Take a pleasure in keeping the boiler and the boiler house clean and bright, and in preventing smoke.

THE BRUSH ELECTRIC LIGHT.

The ancient saw anent the share of milk obtained by the still suckling seems to b pretty well borne out in the progress of the brush system of electric lighting. A dozen systems, so-called, have made more noise and have attracted more newspaper attention; but while they are for the most part still "promising," the Brush system has been quietly taking possession of the field. How far this is due to the superior busness management of the company controlling the Brush patent it is impossible to say; the indications are, however, that the remarkable success of the brush system is mainly due to the practical genius of Mr. Brush in meeting the requirements of outdoor or large room lighting with an efficient generator, and a lamp which is so simple in construction so automatically regular in action, and so easy to keep in order, that practical business men can afford to use it. It is perhaps the least ornamental in appearance of all lamps, but it gives the light required, and calls for comparatively little care. On the score of economy the users of the lamp profess to be well satisfied; and the rapid and largely extended adoption of the system, abroad as well as at home, would seem to justify the favourable judgment which those who have tried the lamp have freely expressed with regard to its practical value.

The latest list of prominent users of the Brush light embraces twenty-five rolling mills, iron and steel works, machine shops, car works, and the like; twenty saw mills, paper mills, oil works, printing houses, and other factories and manufacturing establishments; twenty woollen, cotton, linen, and silk factories, several of them employing over a hundrsd lights each; a dozen mines, smelting works, etc., more than a dozen wholesale and retail stores, using from six to sixty-four lights: a dozen public parks, docks, summer resorts, and the like including a mile and a half of river front and docks at Montreal; circuses, colleges, hotels steamers; and large numbers of city lights in San Francisco, St. Louis, Chicago, Cleveland, Detroit, Grand Rapids, and other cities besides New York and Brooklyn, where a hundred or more lights are already in use. The contracts of the company in San Francisco called for the erection of about a thousand lamps by the beginning of the current year. Wabash, Indiana, claims the credit of being the first large town to adopt the electric lamp for general illumination, four Brush lights, of 3,000 candle power each, on the court house dome, sufficing for the outdoor needs of the entire town of 10-000 inhabitants.

The company formed in London to introduce the Brush light there have already placed two hundred lights in various parts of the city, and have ordered from Cleveland nearly as many more, contracts having been signed for the lighting of the Houses of Parliament, Charing Cross Station, Ludgate Hill Station, Blackfriars' Bridge, St. Paul's Churchyard, and other conspicuous places. Even the extremely conservative British Admiralty has taken kindly to the Yankee invention, 432 lights have been purchased for the use of the Royal Navy. Mr. Brush is now making a 40-light machine (80-000 candles) designed to throw the entire current into one huge lamp, which has been ordered for the British torpedo service. The carbons for this artificial sun will be as large as a man's arm, and the light, when directed by a projector of corresponding size, will of itself be a formidable weapon of defense. With a proper system of curtains it will be possible to flash upon an approaching enemy a sudden glare of light that will be little less than blinding.

A less imposing but more admirable application to this light, and one that is being rapidly adopted, is in connection with locomotive headlights. The generator is operated by a small engine taking steam from the boiler and placed opposite the air compressors of the Westinghouse breaks. By attaching the reflector to the forward truck the light may be thrown so as to illuminate the track ahead even when rounding curves. It is obvious that the same machine which supplies the headlight will also furnish a current for illuminating the cars.

Wherever the electric light has been brought into competition with gas for lighting large rooms or open spaces, it has given a good account of itself in comparisons of cost. In very many cases, however, any comparison with gas is out of the question. With gas it is simply impossible to do certain kinds of work at night, or to do it as rapidly and well as by daylight. With the electric light night production is brought up to the level of day production. The gain of one night's increased production will often pay the cost of electric lighting for months. Practical business men are not slow to appreciate advantages of this sort. The question with them is how much will the electric light cost, but can the light be depended on for steady, uniform, certain operation, without requiring too much expert attention? The ability of the Brush lamp to meet such practical requirements would seem to be the secret of its substantial progress.—*Scientific American.*

A sale of over 100,000 feet of lumber was recently made at Ottawa to be shipped by way of Brockville.

Under Fire.

A SOLDIER'S SENSATIONS WHEN ENGAGED IN BATTLE.

Detroit Free Press.)

Whenever you can find a soldier who, under fire, aims low and shoots to make every bullet wound or kill, you will find fifty who are nervously throwing away ammunition, seeming to reason that the reports of their muskets will check or drive the enemy. And yet this nervousness need not be wondered at, for they are playing a game of life and death.

At Malvern Hill, seventeen soldiers, belonging to an Ohio regiment, took cover in a dry ditch, which answered admirably for a rifle pit. A Georgia regiment charged this little band three times, and were three times driven back. The fire was low and rapid, and the loss in front of their guns was more than one hundred killed in ten minutes. Regiments have been engaged for an hour without losing over half that number. The fire of those seventeen was so continuous that McClellan forwarded a brigade to their support, believing that an entire regiment had been cut off.

At Mine Run the writer was just in the rear of a New York regiment which was suddenly attacked. A single company of confedrates, cut off from the regiment and dodging about to rejoin it, suddenly debouched into a field and found itself face to face with the union regiments. Fighting commenced at once. A regiment fought a company, both lying down from cover. I ay so near a third sergeant that I could touch his heels, and I watched his fire. Every time he pulled the trigger he elevated the muzzle of his gun at an angle of forty-five degrees instead of depressing it for the enemy lying down. I saw him repeat this operation fourteen different times. The man next to him fired as many bullets plump into a stump in his front, and the man on the othersi de shot into the ground about ten feet away. Others must have been wasting bullets about the same way ; but that little company was shooting to kill. In that ten minutes of fighting the New Yorkers suffered a loss of thirty-six killed and wounded, and then a bayonet charge doubled them back and opened a gap for the little band's escape. I walked over the ground and found one dead and one wounded confederate. Not a gun, blanket, knapsack or canteen had been left behind.

Any soldier will no doubt fight better under cover than he will in the open field, but cover does not always insure good fighting. At Pittsburgh Landing five thousand union soldiers skulked under the river bank, safe from the enemy's fire, and many of them threw their guns into the river rather than fire a shot. Again, at Yellow tavern, five of Custer's men, dismounted and lying behind a fence, held five companies of cavalry at bay for twelve minutes, and killed twenty-four men, and this without getting a scratch in return.

At Mine Run a union regiment went into the fight with sixty rounds of ammunition per man, making a total of perhaps four thousand bullets. This regiment was placed to act as a check to any advance of the enemy in a certain direction. They did not see thirty confederates during the whole day, and yet it was twice more supplied with ammunition. It fired away at least twelve thousand bullets, and yet only killed two rebel skirmishers.

One cool man will do more execution with his musket than thirty men firing at random. One must have a will strong enough to crowd down all emotions, and oblige his hands to cease trembling at the word. Out of every regiment, not more than one hundred men were fighters. These shot to kill. The others shot at random, and killed only by accident. Thirty cartridges would last a good fighter for an all day's fight. The ordinary soldier would fire out his sixty in an hour and a half, and like enough have his eyes shut half the time when he pulled the trigger. A member of the 2d. Michigan infantry hit the case pretty well at Blackburn Ford. When the skirmishing began he counted his cartridges, and said :

"Just sixty of 'em, and I'll fire three a minute, and have these fellers licked in just twenty minutes to a tick!"

THERE was a fight emminent between two boys. One of them darkly hinted that he was bigger than the other. The smalier, who is the son of a deacon, defiantly retorted : "I don't care if you are as big as a church debt ; you can't scare me.

Sparrows in a Winter Bath.

Yesterday, during the sunny hour of noon, says the Hartford "Times," a flock of about a hundred English sparrows gathered upon and near a painted tin roof having a protected southern exposure, where a good deal of water had collected in the broad flat gutter. The temperature of the surrounding air was abont six degrees below the freezing point, and water was evidently a scarce article, for the eager little birds rushed for it almost furiously. They dashed in by the dozen, fluttering their wings and tails, and sending the shower of water in a spray around. A dozen new-comers would be actually fighting for precedence. As fast as they finished their bath the birds went to the upper slope of the roof, next the sheltering brick wall of a higher part of the building, and there spread themselves out in the sun, like hens shuffling in a warm sand-bath, spreading out their feathers and turning themselves first on one and then on the other side. One sparrow evidently had his misgivings about taking a plunge into a winter bath ; he stood shivering at the edge of the pool, like an undressed boy on the river's bank when he hesitates to take the first plunge of the season. Some of his more venturesome companions tried to push the bird in. One seized him by the tail and pulled ; another fluttered his wings against him and tried to crowd him in ; and a third tried to operate on his head. It was in vain ; that paaticular bird, though seemingly desirous of a bath, evidently mistrusted the temperature of the water—or his own sanitary powers of resistance in these malarial times, and he wouldn't budge. His companions, to the number of about sixty, then gave it up and crowded together in their selected position of shelter, as closely, seemingly, as swarming bees, making a pretty sight. The social and gregarious characteristics of these sparrows are strongly marked. But they fail to find, in this country, the thatched cottage roofs, and the wheat and barley ricks, in which they are so naturally prone to burrow in English rural districts.

Lord Beaconsfield and Thackeray.

Much bitterness, says a London paper, has been excited in some quarters by Lord Beaconsfield's caraciture of Thackeray, whom the great satirist's admirers profess to identify beneath the traits of St. Barbe, the journalist in "Endymion." The uncomplimentary sketch is thought to be intended as the ex-premier's revenge for Thackeray's burlesque novel of "Collingsby." The likeness in the case as in all other cases, has been purposely distorted so as to leave room for a denial by the noble author that any portrait was intended ; but everybody recognizes the original. Gushy, the rival of whom St. Barbe is always talking despairingly, is taken to be Dickens. Lord Beaconsfield has undertaken to throw people off the scent by amalgamating their characters—thus Vigo is made to be a combination of Poole, the tailor, and of Geo. Hudson, the Sunderland railway king, once omnipotent in English society, but who died in comparative obscurity some years ago. This artifice however, will not save him from severe attacks by the wrathful friends of Thackeray and Dickens.

The Cost to France of the War with Germany.

An astounding statement as to the cost of the war between France and Germany, and of the devastation caused by the Commune, has appeared in the *Economiste Francais*. The writer, M. de Foville, whose official position gives him every opportunity of testing the accuracy of the statement, considers it as being on the whole rather below than above the truth, and that £600,000,000 sterling would be near the mark. Of this the indemnity to Germany absorbs £212,000,000. If there is anything more wonderful than the statement itself, it is the rapidity with which France has recovered from this terrible infliction.

AT a negro prayer meeting, one of the bretheren earnestly prayed that they might be preserved from what he called their "upsettin' sins." "Brudder," said one of the elders, "yer hain't 'zactly got de hang ob dat ar word. It's besettin'—not upsettin'." "Brudder," replied the corrected, "ef dat's so, it's so ; but I was prayin' de Lawd ter sabe us from de sin of 'toxication, an' ef dat ain't a upsettin' sin, I dunno."

Remarkable Remedies.

(From Chambers's Journal.)

Sir Walter Scott's piper, John Bruce, spent a whole Sunday selecting 12 stones from 12 south-running streams, with the purpose that his sick master might sleep upon them and become whole. Scott was not the man to hurt the honest fellow's feelings by ridiculing the notion of such a remedy proving of avail ; so he caused Bruce to be told that the receipt was infallible ; but that it was absolutely necessary to success that the stones should be wrapped in the petticoat of a widow who had never wished to marry again ; upon learning which the Highlander renounced all hope of completing the charm. Lady Duff Gordon once gave an old Egyptian woman a powder wrapped in a fragment of the *Saturday Review*. She came again to assure her benefactress the charm was a wonderfully powerful one ; for although she had not been able to wash off all the fine writing from the paper, even that little had done her a great deal of good. She would have made an excellent subject for a Llama doctor, who, if he does not happen to have any medicine handy, writes the name of the remedy he would administer on a scrap of paper, moistens it with his mouth, rolls it up in the form of a pill, which the patient tosses down his throat. In default of paper, the name of the drug is chalked on a board, and washed off again with water, which serves as a healing draught. These easy-going practitioners might probably cite plenty of instances of the efficiency of their method. Dr. John Brown, of Edinburgh, once gave a labourer a prescription, saying : "Take that, and come back in a fortnight, when you will be well." Obedient to the injunction, the patient presented himself at the fortnight's end, with a clean tongue and a happy face. Proud of the fulfilment of his promise, Dr. Brown said : "Let me see what I gave you." "Oh," answered the man, "I took it, Doctor." "Yes. I know you did ; but where is the prescription?" "I swallowed it," was the reply. The patient had made a pill of the paper, and faith in his physician's skill had done the rest. Faith is a rare wonder-worker. Strong in the belief that every Frank is a doctor, an old Arab, who had been partially blind from birth, pestered an English traveler into giving him a seidlitz powder and some pomatum. Next day the chief declared that he could see better than he had done for 20 years.

Prince Gortschakoff.

"Among the celebrities in Baden-Baden," says a correspondent, "that I see promenading nearly every hour in the day, perhaps there is none more noted or that has a more world-wide reputation than Prince Gortschakoff, who was so long the Imperial Chancellor of Russia, and who for many years controlled a greater influence on European politics than any other man living. He also is passing into the sere and yellow leaf. He is upward of 80, and his silver locks and tottering step give evidence that he is nearly ready for the great harvester of all. Old age has unfitted him for further use or influence in the Russian Cabinet, and he is like an old war horse that has been discarded from active duty after years of hard work in his country's service. He spends the summer months in Baden-Baden and the winters in Southern France or Italy, having ignored Russia as a place of residence. Report says that his mind has become weak and childish, and that he constantly mourns over the ingratitude of his country in not reinstating him in power as in days gone by."

SOME REASONS FOR DRINKING.—An illustration of fertility of resource is recounted, we think by Dean Ramsay, in the story of the dying rustic who "speered" at the parish minister if there would be any whisky in heaven. On being rebuked for this mundane anxiety and irreverent curiosity, Sandy replied in self-excuse : "That it wasna because he wad tak ony if it were offered him, but jist in respeck that it wad look weel on the table." We have not forgotten that Highland teetotaler who was found drinking the mountain-dew at his breakfast in some wayside inn where he thought he would not be known. "Och, Donald, and we thocht ye were an abstainer!" exclaimed a Deacon who happened to look in quite unexpectedly. "And so I am," replied the detected culprit, who scorned to suggest that his beverage was only toast-and-water—"so I am ; but ye ken, my frien', I am no a bigoted ane."

Irish Titles.

The intelligent foreigner may surely be excused if he owns himself fairly bewildered and perplexed to find a key to the full meaning of half the abbreviations of titles and dignities he comes across in the newspaper any one morning in the week. But in Ireland the problem is still more vexed and involved than it is here. The habit of publishing a man's titles to distinction or respectability is carried to far greater lengths there than it is on this side of St. George's Channel ; and there must be many cabalistic letters crowded in close succession after an Irishman's name which must be wholly unintelligible to the ordinary Englishman. He can understand the meaning of J. P. and D. L., although the social position of a magistrate or a Deputy Lieutenant is not habitually advertised with us an all occasions ; but he may not that know P. L. G. stands for Poor Lady Guardian—an official of some importance in the present day in Ireland—or that T. C. is a handle that may be equally worn by a member of Trinity College, Dublin, and a Town councillor. The latter, however, would consider himself seriously ill-used if it were not given him on all occasions ; and so would a member of the Royal Irish Academy if the letters "M. R. I. A." were not always appended to his name. At a very early period Catholic clergymen adopted the letters "C. C." (Catholic Curate), and "P. P." (Parish Priest, in order to distinguish themselves from the heretical ministers of the once Established Church ; while "R. M." in Ireland does not stand for Royal Marines, but is used to separate the resident magistrate—answering to the stipendiary magistrate of our great towns—from the army of the "great unpaid." The curious depreciation of things Irish which characterizes even the "National" Irishman contributes to swell the number of these verbal puzzles, a member of the Royal College of Veterinary Surgeons of England being anxious to let every one know that he did not get his diploma in Dublin. And so this rage for some letter after the surname bites men of all ranks and all ages, and the humblest Irishman who has not been be-lettered while living may safely count on "R. I. P." being penciled on his tombstone.

Married in Defiance of the Court.

(From the London Telegraph.)

Indulgent public opinion might have recorded a unanimous verdict of acquittal in the case of the audacious young man who took upon himself to run away with and marry a ward in Chancery, had it not been for the very reprehensible course he thought fit to adopt in misrepresenting the young lady's age to the clergyman who sealed the nuptial bond. She was 22, he averred, whereas she turned out to be only 19 ; and, to add to the enormity of his offense, he further represented himself to have slept for three weeks in a parish which he had, as a fact, only honoured by a perfunctory sojourn of a single night. As Vice-Chancellor Malins pointed out, there is a lamentable laxity about a system which enables two romantic young people, neither of them past legal infancy, to get married by making false declarations of age, with no further questions asked. In the case of Mr. Metzgar, who perpetrated this particular fraud upon the cleric, he had been previously prohibited by the Court of Chancery from holding any communication whatever with the object of his affections ; so when he deliberately carried her off and married her, his conduct may have had a touch of romance about it, but it was quite certain to receive punishment. The marriage is now valid, but the unfortunate bridegroom is in prison, a victim to the offended dignity of the Court of Chancery and only after a period of jail discipline and the humblest apologies is there any chance of his being liberated. It is quite right that the Chancery Judges should keep a very sharp eye on the doings of infants, as they are the official guardians of all minors in the country, as well as those who, by virtue of their fortunes, are in the peculiar condition of "Wards of Court ;" but it may be hoped that the amorours desperation which has landed the unfortunate bridegroom in a jail will carry him cheerfully through his confinement, and restore him afterward—a wiser, if a sadder man—to the society of his ill-won bride.

IT is the confession of a widower who has been thrice married that the first wife cures a man's romance ; the second teaches him humility ; the third makes him a philosopher.

The Knight of Ravenscrag.

The "The Celebrity at Home" Sketch of Sir Hugh Allan.

James street, Liverpool, the broad thoroughfare leading from St. George's Church to the docks, is a street among streets. From earliest dawn lorries laden with huge bales of cotton or larger hogsheads of sugar, light carts with their Irish drivers indispensable to the seaport but the terror of its inhabitants, and the four-wheeler with Jack ashore, and "his cousins and his aunts" toil up, or rather down, it. On the one side are grim and many-storied warehouses; on the other less impressive hostleries much affected by master mariners. Of the former, the central and principal building presents the facade of an Italian palace pierced with five windows on either side of the granite pillared entrance. This is the counting house of the "Allan Line," a name as familiar in Liverpool as the landing stage or the Town Hall, and to the Canadian more than a household word, since it represents the link that binds the Dominion to the Mother Country. And it is something more than name. Modest in its origin, starting with two vessels only, and at one time threatened with extinction through unparallelled misfortune. The Allan Line of steamships rivals in importance the Cunard or the Peninsuiar and Oriental, and differs from these companies in being the largest and finest fleet that is retained in private hands. It belongs entirely to the firm of Allan Brothers & Co., and has feeders in its completement of sailing clippers, and in the connecting lines of railways and of lake navigaiton, the control of which centres in the same hands. It possesses, too, a reputation for comfort and safety which induces many travellers to give it the preference as a route to the States. Its aim, however, is to benefit the Dominion, and thus it comes about that the names of Canada and the Allan Line are inseparable.

This vast carrying trade, like all other successful enterprises, has one directing genius. A man who does not obtrude himself on the public, yet unmistakably a man in a thousand and a man of the times, is Sir Hugh Allan, the founder of the line, and the head of the firm. He is at once the richest and most influential citizens of his adopted country, for Sir Hugh is, of course, a Scotchman, typically sagacious and indomitable. Within a year of the allotted span there is about him the unmistakable air of power. Age has scarcely impaired the elasticity and vigour of the massive frame; it has but emphasized the resolution expressed in the lines of the face. Physical power and mental capacity—this is the combination, rare as it is admirable.

Like all men who have seen the world, Sir Huge is a practical cosmopolitan, as much at his ease in the Grand Hotel at Charing Cross, or in the Liverpool offices, as in the streets of Montreal, and thinking as little of a run across the Atlantic as a Londoner does of a trip to Brighton. Nevertheless there is something in the tone of the greeting which meets you on the broad terrace overlooking the mighty St. Lawrence that says unmistakably, "Here I am at home."

"Ravenscrag," a massive pile of roughly hewn granite, rises boldly from the side of the Royal Mountain which gives the city its name. The walls are of enormous thickness, and well calculated to withstand the extremes of temperature incidental to the climate. Its twelve acres of garden and shrubbery are surrounded by the celebrated Park of Montreal. The view from the terrace can scarcely be surpassed. At your feet lies the city, with its trees, shaded avennes, and streets, its handsome public buildings and innumerable spires. Beyond it flows the great river, here two miles wide, crowded with shipping of all nationalities, and spanned by the world-renowned Victoria bridge; whilst the fertile plains of Vermont stretch away to the distant horizon. Within the house a suite of drawing-rooms leads through a noble ball-room to extensive conservatories in which it is easy even in the depth of a Canadian winter to imagine oneself in the tropics. The great central chamber with its parquet floor of native woods is often the scene of triumphs in dress, beauty, and flirtation. It is the boast of the colony that the "Blue noses," as some would call them, or the Dominion belles as they are properly named—for the former term is rather local than generic—are the best looking women in the world.

But the library, with its dark, solid furniture, large open fireplace, and prevading air of quiet comfort, is the room of the house. Here, after the day's toil, Sir Hugh spends a couple of hours in relaxation, a game of whist with some of the members of his family—his children number a round dozen—or with the chance visitor. It is, too, the scene of work as well as play, for it has been for years Sir Hugh's invariably custom to return to his sanctum when the household has retired for some hours of steady, hard work, writing reports for some of the numerous companies over which he presides, scrutinizing the statements of managers, or sketching the possibilities of some new enterprise. To a man of his calibre, who is the motive power in everything with which he is connected, such labour is enjoyment only to be eclipsed by his delight in exploring some unknown bay, or in speeding on his yacht through the blue waves of Lake Magog.

"Belmere," the country house used by the family during the hot summer months, is on the edge of this sheet of water—one of the prettiest on the continent—the mountains rising around it to the height of four thousand feet, its surface lively with minature flotillas of steam and sailing yachts, canoes and boats in constant demand for acquatic diversions. It was here that Sir Hugh received the Duke of Connaught when His Royal Highness was with his regiment in Canada. The lake, which is thirty miles in length, is neutral ground, lying partly in the Dominion and partly in the States, the boundary line running across its centre.

As a host Sir Hugh is cordial without elusion. He has his peculiarities which, however, are not allowed to interfere with the comfort of his guests. He has never smoked, he has wisely eschewed spirits altogether until quite recently, when he has been obliged to take a little for his health's sake. Fond of cards, he has never risked more than a shilling on any game of chance in his life. Yet he spends his money with an open hand, and is generous and discreet in gifts. He possesses in a remarkable degree the faculty of throwing off all business cares when his work is done, and avows that even in the most harrassing times he has never allowed mental worry to rob him of an hour's sleep. His conversation aims at being sensible rather than brilliant. One who has seen and done much cannot speak without speaking well. There is a charm, too, in his manly accents which only reach enthusiasm when, Colonist to the backbone as he is, he talks of "the land of brown heath and shaggy wood."

When on the first of May, fifty-four years ago, the self-possessed Ayshire lad stood on the deck of the vessel which was towed to the bank—in those days Montreal did not possess a wharf—by a small tug aided by a team of oxen, he had no prevision that he was to be the chief agent in making the spot prosperous and busy. He had no thought of the great warehouses and steamships, the crowded wharves, all his own, which have grown up as if by enchantment. The lad's ambition rose no higher than to own a ship and command it, as his father had done before him. Yet his career was fixed. He was destined to create, and to maintain what he created. Difficulty could not deter him. He accepted what work he could get, and stayed in the new country until he was of age; then he came home and arranged with his brothers a plan of concerted operations. With this end in view he returned to his adopted home, became a clerk in a shipping-house, rose to be a partner, and then started for himself as a ship-owner and ship-builder. After several unsuccessful attempts to interest the Government on the project, Mr. Allan's firm at length obtained the contract for a line of steamers between Great Britain and Canada, and the "Allan Line" spraug into existgnce. At one time it appeared as though fate were against them. Ship after ship was wrecked. His brothers lost heart, but not so Sir Hugh himself. "Providence," he affirmed, "has not a special grudge against any honest enterprise, nor does it show it by bringing destruction upon innocent people. The fault is in ourselves in some disregard of nature's law. It is we who must find out what's amiss, and set it right." And he set to work. He traced the cause to the navigation at a high rate of speed of a dangerous gulf only partially surveyed and badly lighted. He induced the Government to grant an extension of the time for the performance of the voyage, and the danger disappeared, the "Allan Line" being to-day as celebrated for its safety as for its regularity.

But Sir Hugh Allan has not been content with success in the home sphere of business. Enterprises of all kinds connected with the colony receive his support, and are directed by his experience. Besides owning the principal share in his trans-Atlantic fleet, he is the President and chief shareholder of the Richelieu and Ontario Navigation Company, and practically the sole proprietor of the Halifax and Cape Breton Railway, constructed at a cost of nearly a million sterling, and of the greater part of the coal fields of Nova Scotia. He is founder and president of the Montreel Telegraph Co., and founder and a director of the Merchants' Bank of Canada; one of the largest shareholders in the Pullman Palace Car Company, and director of any number of other companies, including insurance, cotton, woolen, and rolling mills, India rubber and tobacco manufactories, and the owner of gold, silver, and copper mines.

But though he might rightly be called the greatest all-round merchant in the world, Sir Hugh's chief claim to public confidence is his absolute indentification of his own interest with those of the Dominion. The one passport necessary to obtain a hearing from him is the statement that the proposal intends to benefit his adopted country. He has provided Montreal with a theatre, a magnificent concert hall, and assembly rooms. He has done more for the material progress of Canada than any other ten men. There is not an industry in the couuntry to which he has not at one time or another lent both brains and capital, often when the prospects of a return have been remote, and of all his immense fortune not a penny is invested outside the Dominion except in enterprises intimately connected with it. Throughout his long career, far from abusing the enormous trusts imposed upon him, he has rigidly set his face against wire-pulling or speculation on the part of his fellow-directors. He has never let any petty or personal desire interfere with what he considers his duty. He marks out his course and follows it with little, perhaps too little, regard for the opinion of the public—for an attitude of the kind is not conciliatory, and in putting down incipient commercial wrong-doing with a strong hand he has not failed to make enemies, ever afterwards anxious to spy a crevice in the proof armour of his honesty.

But it is not necessary, for the justness of his action is now universally recognized. His massive intellect, his massive business capanity, and his iron will have ever been at the service of his fellow-citizens, and they know it. In his success he invites comparison with the great millionaires of the neighbouring States, but with this difference, it has been gradual and steady, and independent of lucky hits or ingenious concerning. He is in this way an admirable representative British colonist of whom the Yankees themselves would say, "If any man living can beat his record send him along."

Snow Bound on the Plains.

TRAVELLERS CAUGHT IN THE FIERCEST OCTOBER STORM EVER KNOWN IN NEBRASKA.

(From the Worcester Spy).

We pitched our tents carelessly, intending to take an early start the next morning. But, alas, for our expectations! During the night a strong wind set in from the northwest, and about 4 A.M. it began to snow. None of us could judge well of weather indications in Nebraska, and our guide did not suspect anything serious, for the oldest inhabitant could not expect a blizzard in October, and it was now only the 15th of the month. The guide thought, and the drivers believed, that the storm would cease at 12 M., and we, of course, trusted to their judgment. But, instead, the storm grew fiercer, the snow fell more aapidly, and the northwest gale increased in fury. Before night so much snow had fallen that if it had lain as it fell it would have been at least one foot deep, but now it had been piled into drifts so that our mules stood with their feet nearly as high as the wagon tops, and the stove and furniture in our cook's tent were completely hidden from view.

The night shut in upon us gloomy and awful. We had two light canvas tents, in each of which slept four men, with just blankets enough to keep them comfortable in ordinary weather. But now we must provide for the guide, two drivers, and a porter, who had usually slept in the wagons, and, as they were slimly provided with clothing, we must share our stock with them. There was but little sleep in the tent that night, the cold was intense, and the wind was so terrible in its effects that we feared every moment the larger tent would fail, though we had strengthened it by cords in every conceivable way. With the morning light it seemed as if all the spirits of the air were let loose, and all day long the storm roared with ever-increasing fury. The snow had so beaten in that when we awoke we found ourselves buried beneath it, and now we were obliged to gather all our bedding into the middle of the tent to keep it from being wet through. No man could long endure the storm outside, and we stood huddled together from morning till night, stamping our feet to keep from suffering. Even then we could not keep comfortable. For hours together we stood with our backs braced up against the tent to keep it from giving way under the great weight of the snow and the terrific force of the gale. I know of no language which can be used to convey to any person inexperienced in such a time any adequate conception of the fury of the storm. During the second day we succeeded in digging our little stove out of the snowdrift, and, setting it at the entrance of our tent, we managed to keep a little fire through the rest of the day and night. But our store of wood was very small, and there was no more to be had within we knew not how many miles. The other tent's company had no stove and no fire. During the second night of the storm it was impossible that all should sleep at once, even if they could sleep despite the cold, for what with the stove on one side and all our provisions brought in from the wagons on the other, there was not room for all to lie down. Besides, it was necessary to keep the fire going lest we might all perish together. So we stood bending over the stove all night, two at a time, while the others tried to sleep. It was an awful night. To add to our anxiety, the guide and drivers declared that the horses and mules were likely to perish. They were a pitiful sight, indeed. Two of them had no blankets, and the others were little better off. At times it was difficult to conceive that the creatures before us were horses, so literally covered were they with a coating of ice. After two days and two nights the storm ceased.

It was now Sunday morning. We knew not where we were, and we doubted if the guide had more definite knowledge than we. Every man was desperate. Some declared it dangerous to attempt to move through the snow, and that our only safe course was to remain, and in case of necessity, use the wagons for fuel and the horses for food. Others declared their purpose to move at all hazards, and without delay. Finally we determined to move. We threw away all luggage that could be dispensed with, and in grim silence started in the direction which we thought would bring us to the nearest hut. It was difficult travelling through the drifted snow, and it was bitterly cold. But all day long we pushed on, never stopping to feed a horse, breaking through the drifts with our ponies so that the teams could low, till about 5 p. m., when we came in sight of haystacks, in the vicinity of which we knew there must be a ranchman's hut. I never saw a happier set of men than were these when it became certain that what they saw were haystacks, and not the terrible sand hills which had so often deceived us during the day. Grave men, merchants of Worcester, swung their hats aloft and shouted for joy. It had been a march for life.

The Utilizing of the Tides.

A Philadelphia engineer has invented, it is claimed, a machine by which the power of the tides can be utilized. Numerous plans have been proposed for the accomplishment of this most desirable end, but only under exceptional conditions have they been practical or economical. If the new device can harness the tide in an open channel, so as to convert any considerable portion of the vast power into working force, the inventor will rank among the great benefactors of humanity. Emerson says somewhere: Hitch your wagon to a star. A device for utilizing mechanically the free tides, as they sweep along our shores, would come next to that, since it would enable us, through converters and carriers of electricity, to hitch our wagons to the sun and moon.

An exchange says: "Streams all over the country are running dry." This a a canard. When a stream is dry it can't run."

A Hamilton man with an ingrowing nail, chopped his toe off. This remedy never fails. For sale at all hardware stores. Beware of imitations.

MICHIGAN SAW MILLS.

The following items will show what our neighbors in Michigan have been doing last season :—

William Buckley, Chase, has cut 1,000,000 feet.

C. R. Twichell, Maple Hill, made 17,822 shingles.

J. E. White, Pentwater, reports 3,000,000 shingles.

J. & J. Ratz, Reed City, report a cut of 800,000 feet.

Closson & Gilbert, Manton, have cut 3,800,000 feet.

John Beardon, Midland, has made 6,000,000 shingles.

J. M. Weatherwax, Stanton, reports 4,750,000 feet.

Henry Stephens & Co., St. Helens, have cut 7,000,000 feet.

M. S. Lockerly, Sand Lake, has made 8,000,000 shingles.

J. R. Borst's mill, Cedar Springs, has cut 13,500,000 shingles.

E. A. Foster & Co., Ludington, turned out 20,864,000 shingles.

Morris & Richards, Breckenridge, have cut 800,000 shingles,

R. Peacock, Bay de Noquette, has cut 5,000,000 feet of lumber.

E. S. Briggs & Brother, Vicksburg, report 185,000 feet of hardwood.

E. Shay, Haring, reports 5,000,000 feet cut, and all of it on hand.

J. H. Nyman, Bangor, who does custom work, has cut 100,000 feet.

J. Miller Raub's mill, Chase, has turned out 2,000,000 feet of lumber.

Taber & Hopkins, Rockford, cut 1,700,000 feet of lumber, 300,000 pickets.

Ramsay & Jones' mill, Menominee, has cut 9,000,000 feet, 1,800,000 lath.

J. E. Nelson, Cedar Springs, has cut 1,000,000 feet, 14,500,000 shingles.

C. Pelton, Cedar Springs, cut 9,000,000 shingles, and has 300,000 on hand.

A. B. Wiser, Birch Run, has cut 840,000 shingles, and has 18,000 on hand.

J. &. F. L. Post's mill, built the past fall at Clare, has cut 500,000 shingles,

F. W. Gilchrist, Alpena, has cut 15,000,000 feet of lumber, 3,594,000 lath.

Baker & Murray, Big Rapids, have cut 4,000,000 feet, and 8,000,000 shingles.

A. K. Moyer & Co., Cadillac, report 10,000,000 feet, with 7,000,000 on hand.

Dewy & Stewart, Owassa, cut 7,500 feet of pine and 31,000 feet of hardwood.

William Steinberg, Twin Lake, 1,400,000 feet of pine and 50,000 feet of hardwood.

Bond & Keysor, Bond's Mills, have cut 9,500,000 feet of lumber and 380,000 lath.

W. Young & Co., Cheboygan, have cut 1,500,000 feet, and have 1,000,000 on hand.

F. & E. Haertel, Centralia, have cut 100,000 feet of hardwood and 3,000,000 shingles.

Cobbs & Mitchell, Cadillac, report 14,718,836 feet of lumber and 500,000 bed slats.

C. W. Dunning & Co., Twin Lake, have cut 700,000 feet of lumber and 80,000 shingles.

Oliver, Belknap & Green, Greenville, report 3,000,000 feet of lumber and 200,000 lath.

William Broadwell, Bangor, has cut 1,200,000 feet of hardwood, and has 200,000 on hand.

J. W. Young, Farewell, has cut 7,000,000 feet of pine and has 2,000,000 foet on hand.

Morris & Stebbins, Mears, have cut 6,000,000 shingles and have 250,000 on hand.

C. H. Forman, Forman, has cut 3,000,000 feet of lumber, 500,000 feet on hand.

Gerrish & Diggins, Hersey, have made 21,350,000 shingles, 2,000,000 of which are on hand.

A Gilbert, Stanton, has cut 680,000 feet of fumber and has 250,000 feet of it on hand.

C. N. Storrs, Muskegon, has cut 9,000,000 feet of pine and 1,000,000 feet of hardwood.

F. S. Farr, Muskegon, cut 28,000,000 feet of lumber, 4,300,000 lath and 1,022,000 pickets.

D. W. Lewis & Co., Manistee, have cut 100,000 feet, 20,000 on hand, and 35,000,000 shingles.

A. B. Long & Son, Grand Rapids, have cut 11,000,000 feet of lumber, 4,500,000 shingles.

C. H. Hackley & Co., Muskegon, report 30,173,962 feet cut, 8,000,000 lath, 35,000 pickets.

James Gibson, Fremont Center, has cut 125,000 sets of heading and 5,000,000 shingles.

L. H. Withey & Co., Grand Rapids, have cut 4,000,000 feet, and have 2,700,000 feet on hand.

Smith & Field, Spring Lake, have cut 3,000,000 feet of pine and 100,000 feet of hardwood.

F. N. Wright & Co., Greenville, have cut 3,000,000 feet of lumber, 3,000,000 shingles, 1,500,000.

George J. Quimby, Grand Rapids, has cut 1,500,000 feet of lumber, and has on hand 600,000 feet.

C. C. Comstock, Grand Rapids, has cut 7,500,000 feet of lumber, and has 3,000,000 feet on hand.

C. A. Hawley, Shelby, has cut 1,200,000 feet of hardwood, and has 100,000 feet of it on hand.

Geo. N. Lee, Delta, manufacturer of handles and oars, has cut 600,000 feet of hardwood.

McCoy & Ayer, Cadillac, cut 10,000,000 feet, 4,500,000 on hand ; 926,550 lath, 450,000 on hand.

Charles Beaudry & Co., Muskegon, cut 13,000,000 feet of lumber, 1,600,000 lath and 400,000 pickets.

W. H. Biglow & Co., Muskegon, have cut 14,702,000 feet of lumber, 15,000,000 lath, 160,000 pickets.

Swan, White & Smith, Muskegon, cut 21,000 0f0 feet of lumber, 3,250,000 lath and 116,000 pickets.

R. Whitman, James Redmond, agent, Stanton, has cut 3,000,000 feet of lumber, all of it on hand.

Herbert, Thomas & Co., Chase, have cut 2,500,000 feet of lumber, nearly all of which is on hand.

Freed Brothers, Stanton, report 100,000 feet cut, 20,000 on hand ; 5,000,000 shingles 400,000 on hand.

W. Bishop, Shiloh, has cut 1,000,000 feet of pine, 300,000 of hardwood, and has 100,000 feet on hand.

G. A. Wagnar, Mears, reports 2,500,000 feet of pine, 500,000 feet of hardwood and 4,000,000 shingles.

W. H. & E. K. Potter, Alpena, report 10,000,000 feet of lumber, 10,000,000 shingles, 2,000,000 lath.

D. D. Davie Trufant, has cut 300,000 feet of pine, 100,000 feet of hardwood and 3,500,000 shingles.

A. C. Fisher & Son, Coral, report 1,000,000 feet of pine, 50,000 feet of hardwood and 50,000 shingles.

N. A. Cobb, Ashton, has cut 600,000 feet of pine, 100,000 feet of hardwood, and has 150,000 feet on hand.

Higbee & Hugh, Morley, have cut 2,500,000 feet of pine, 200,000 feet of hardwood, and 150,000 shingles.

W. H. Thompson, Kalkaska, has cut 4,500 000 feet of lumber, 1,500,000 on hand, and 500,000 shingles.

F. G. Kendric, Birch Run, has cut 902,786 feet of pine, 104,742 feet of hardwood and 500,000 shingles.

The Pere Marquette Lumber Company, Ludington, report 9,056,664 feet cut, and 4,000,000 feet on hand.

Wilson Brothers & Miller, Evart, report 200,000 feet of pine, 25,000 feet of hardwood and 200,000 shingles.

White Brothers & Co., Colby, report 1,200,000 feet of pine, 50,000 feet of hardwood and 1,400,000 shingles.

Sawyer, Goodman & Co., Menominee, report 4,200,000 feet of lumber, 4,800,000 shingles and 402,000 lath.

Bennett & Barnard, Colwell, have cut 8,000,000 feet of pine, 50,000 feet of hardwood and 3,000,000 lath.

A. V. Mann & Co., Muskegon, has cut 23,372,185 feet, 3,627,600 on hand ; 6,221,000 pickets, 880,400 on hand.

Charles Mears, Whitehall, has cut 800,000 feet of pine, 500,000 feet of hardwood, and has 800,000 feet on hand.

J. S. Minor, Alcona, have cut 12,500,000 feet of lumber, 1,250,000 on hand ; 2,200,000 lath, 350,000 on hand

H. D. Churchill, Alpena, has cut 12 755,675 feet of lumber, 3,550,000 on hand ; 4,045,550 lath, 425,000 on hand.

E. P. Hayes, Woodville, has cut 5,000,000 feet, 2,000,000 on hand ; 9,000,000 shingles, 250,000 on hand.

G. L. Dean, Sheridan, has cut 500,000 feet of pine, 100,000 feet of hardwood, and has 150,000 feet on hand.

Hannah, Lay & Co.'s mill, Traverse City, has made a cut of 18,183,400 feet, of which 7,000,000 are in the yard.

James Gowen, Gowen, has cut 3,000,000 feet of lumber, 3,500,000 on hand, 725,000 shingles, 250,000 on hand.

Smith Brothers, Cheboygan, have cut 6,673,653 feet of lumber, 1,250,375 shingles, 2,070,950 lath, 940 pickets.

Henry Stephens' mills, at Stephens, have cut 25,000,000 feet of lumber, 5,000,000 shingles and 5,000 000 lath.

George E. Dewey, Shelby, has cut 80,000 feet of pine and 338,000 feet of hardwood. He has 50,000 feet on hand.

The Stronach, Lumber Company have cut 11,300,000 feet of pine, 75,000 feet of hardwood and 268,000 shingles.

George W. Roby & Co., Ludington, have cut 17,586,832 feet of pine, 50,000 feet of hardwood and 2,693,050 lath.

W. Batcheler, Grand Haven, has cut at his mill, at Spring lake, 7,000,000 feet, 5,000,000 of which is on hand.

Bellows Brothers' mill, Frankfort, closed down with a cut of 1,300,000 feet of pine and 200,000 feet of hardwood.

Sands & Maxwell, Pentwater, have cut 5,000,000 feet of pine, 2,000,000 feet of hardwood, and 15,000.000 shingles.

R. W. Bellamy & Co., Hersey, cut 1,000,000 feet of pine, 500,000 feet of hardwood, and have 100,000 feet on hand.

Raymond & Duming's mill, Evart, cut 500,000 shingles. The mill burned Sept. 7, and will not be rebuilt at that point.

George N. Stray, trustee, Ludington, informs us that his mill has cut 19,183,801 feet, and he has 500,000 feet on hand.

Covell, Ocobock & Co.'s shingle-mill, Whitehall, Mich., has cut 28,245,000 shingles, and there are 3,000,000 on hand.

Johnson & Link, Cedar Springs, have cut 3,000,000 feet of pine, 200,000 feet of hardwood, 1,000,000 lath and 5,000 pickets.

Hartt, Ware & Horning, Woodville, have cut 8,000,000 feet, 3,500,000 on hand. They have also at their mill 1,000,000 lath.

James Campbell, Westwood, reports 1,200,000 feet of pine, 250,000 feet of hardwood, 300,000 shingles and 250,000 lath.

The Deer Lake Company, Ishpeming, have cut 2,780,976 feet of lumber, 524,000 shingles, 199,000 lath and 30,000 pickets.

Thomas R. Lyon, agent, Ludington, has cut at one of his mills 22,000,000 feet of lumber, 6,850,000 shingles and 155,000 lath.

Ruddock, Palmeter & Co., Manistee, have cut 17,650,133 feet of lumber, 9,033 000 shingles, 4,590,650 lath and 44,519 pickets.

The Beidler Manufacturing Company, Muskegon, have a record of 22,800,000 feet of lumber, 7,164,000 lath, 35,000,000 pickets.

George Hannahs, South Haven, has cut 3,000,000 feet of pine, 245,000 feet of hardwood, 1,000,000 shingles and 300,000 pickets.

Henry Stowe, Orono, cut 500,000 feet of lumber and 5,000.000 shingles. On hand, 150,000 feet of lumber and 2,000,000 shingles.

William Bakker & Son, Grand Haven, report 6,000,000 feet cut, and 2,000,000 on hand. Also, 100,000 pickets, and 50,000 on hand.

The Chicago Lumbering Company, Manistique, have cut 17,000,000 feet of lumber, 1,500,000 shingles, 3,000,000 lath and 225,000 pickets.

Cartier & Filer, Ludington, have cut 14,000,000 feet of lumber and and have 500,000 feet on hand. They have also cut 1,500,000 shingles.

Parmelee & Tremain, Lodi, report 400,000 feet, 60,000 on hand, and 50,000 shingles. The capacity of the mill will be increased.

The Wagar Lumber Company, Colby, have cut 2,000,000 feet of lumber and 6,000,000 lath. On hand, 500,000, feet of lumber and 1,000,000 lath.

Blodgett & Byrne, Holton, have cut 4,000,000 feet of pine, 300,000 feet of hardwood and 3,000,000 shingles. On hand, 2,500,000 feet.

Butterfield & Crable, Alpena, report 11,000,000 feet, 2,000,000 on hand ; 4,500,000 lath, 700,000 on hand ; 85,000 pickets, 60,000 on hand.

E. T. Merrill, Ashton, cut 200,000 feet of lumber, all on hand. One clapboard machine will be added to the machinery the coming season.

Judson D. Smith, Cheboygan, has cut 11,000,000 feet of lumber, 500,000 lath. At Rogers City, Mr. Smith has cut 2,400,000 feet of lumber.

L. Van Winkle, Farwell, has cut 4,000,000 feet of lumber and 3,000,000 shingles. He has 1,500,000 feet of lumber and 400,000 shingles on hand.

Hileman, Hesser & Co., Trufant, have cut 7,500,000 feet, 4 000,000 on hand ; 9,000,000 shingles, 2,500,000 on hand ; 2,500,000 lath, 1,000,000 on hand.

S. H. Gray & Co., Big Rapids, have made 12,000,000 shingles and have 1,000,000 on hand. The capacity of the mill will be doubled this winter.

E. W. Bond & Son, Fife Lake, have cut 7,000,000 feet of lumber and 400,000 lath. They have 4,000,000 feet of lumber and 200,000 lath on hand.

A J. Summerville & Co., Chase, have cut 3,000,000 feet of lumber, 200,000 shingles and 150,000 lath. They have on hand 1,500,000 feet of lumber.

Begole, Fox & Co., Flint, report 6,500,000 feet of lumber, 1,200,000 shingles and 900,000 lath. On hand, 6,000,000 feet of lumber and 500,000 lath.

The Stanton Lumber Company, Colby, have cut 10,000,000 feet of lumber and 7,000,000 lath. On hand, 7,000,000 feet of lumber and 1,000,000 lath.

James W. Willett, Stanton, reports 3,000,000 feet of pine and 30,000 feet of hardwood. He has on hand 5,000,000 feet of lumber and 10,000 pickets.

Nickerson & Collester, Pentwater, have cut 800,000 feet of pine, 2,500,000 of hardwood and 2,500,000 shingles. They have 100,000 feet of lumber on hand.

William Rutherford & Co., Muskegon, report 20,287,122 feet of lumber, 900,000 feet on hand ; 5,776,000 lath, 510,000 on hand ; 208,250 pickets, 1,350 on hand.

A. G. Butler's mill, Frankfort, has cut 12,593,090 feet in a run of 152 days. He has another mill with a capacity of 6,000,000 feet, which has cut 4,760,480 feet.

The N. Ludington Company's mill at Escanaba, has cut 6,198,000 feet, and have 1,000,000 feet on hand. The mill has also cut 1,000,000 lath, and 125,000 pickets.

Charles L. Gray & Co., Evart, have cut 2,000,000 feet of pine, 200,000 feet of hardwood and 6,000,000 shingles. On hand, 200,000 feet of lumber and 200,000, shingles.

Munroe, Boyce & Co., Grand Haven, have cut 7,000,000 feet of lumber, 4,500,000 on hand ; 800,000 lath, one-half of them on hand ; 320,000 pickets, all of them on hand.

G. F. Case's mill, Stanton, has cut 3,000,000 feet, 1,000,000 on hand ; 3,000,000 shingles, 400,000 on hand ; 500,000 lath, 100,000 on hand ; 50,000 pickets, 10,000 on hand.

F. W. Read & Co., Eagle Mills, report 3,000,000 feet, 200,000 on hand ; 945,000 shingles, 107,000 on hand ; 559,000 lath, 37,000 on hand ; 29,257 pickets, 63,000 on hand.

A. J. & C. E. Covell, Whitehall, have cut 10,900,000 feet of lumber, 2,200,000 lath and 100,000 pickets. On hand, 1,765,000 feet of lumber, 100,000 lath and 40,000 pickets.

W. C. Culbertson, Menominee, has cut 9,000,000 feet of lumber, 1,500,000 lath and 100,000 pickets. He has 5,000,000 feet of lumber on hand, 500,000 lath and 10,000 pickets.

Staples & Covell, Whitehall, have cut 11,800,000 feet of pine, 200,000 feet of hardwood and 2,500,000 lath. They have in their yard 1,000,000 feet of lumber and 200,000 lath.

The Kirby-Carpenter Company, Menominee, have sawed 50,570,169 feet of lumber, 5,049,00 lath, 377,997 pickets, and have now on hand 1,802,039 feet of lumber, 886,000 lath and 215,080 pickets.

The Sextus N. Wilcox company, White Cloud, have cut 16,000,000 feet of pine, 20,000 feet of hardwood, 2,400,000 lath and 68,000 pickets. On hand 9,700,000 feet of lumber, 600,000 lath and 68,000, pickets.

Walworth & Reed, Cedar Springs, have cut 9,000,000, 3,000,000 feet on hand; 5,000,000 shingles, 1,500,000 lath, 350,000 on hand; 150,000 pichets, 30,000 on hand The Mill has been removed to Montague.

Rich Brothers, Ontonagon, cut 4,000,000 feet of lumber, 1,500 000 feet on hand; 6,000,000 shingles, 250,000 on hand, and 10,000 pickets. The mill was burned October 4, and it now being replaced by one of double its capacfty.

O. R. Johnson & Co., Douglass, have cut 1,200,000 feet of pine, 70,000 feet of hardwood and 881,000 shingles. The same firm's mill, at Saugatuck, has cut 4,850,000 feet of pine, 1,350,000 feet of hardwood, 2,500,000 shingles and 17,000 lath.

C. Mears & Co.'s Duck Lake, mill cut 320,700 feet of pine and 399,162 feet of hardwood. Their Silver Lake mill cut 1,905,951 feet of pine and 61,377 feet of hardwood, and their Lincoln mill, 1,046,871 feet of pine, 140,501 feet of hardwood, 268,000 shingles and 155,400 lath.

The Nipissing District.

Some time since we referred to the development of the Nipissing district by the building of a propeller by A. P. Cockburn, Esq., M. P., to run on Lake Nipissing next season. The proposed steamer, the "Inter-Ocean," is expected to be ready to make a trial trip by the end of June next. The workmen to be engaged in constructing the steamer left Muskoka, by way of Rosseau, about the middle of last December. A correspondent, recently writing, says:—"Owing to the difficulties of communication all the settlers in the Nipissing District so far have settled on the south side of the lake; and there is actually only one man, with his wife and child, living in all the vast expanse of territory north of its waters. The establishment of short colonization roads running north and south from the lake; the navigation of the Stugeon river and other tributaries of the Nipissing by the 'Inter-Ocean'; the daily arrival of trains at Callender, and the construction of the Sault Branch Railroad, will give a wonderful impetus to the settlement of the country. As demonstrating that the winters in the Nipissing District are not of necessity more severe than those in Muskoka, the fact is communicated that although last week there were about two feet of snow at Bracebridge, there were only three inches at Lake Nipissing. The most recent surveys confirm every statement as to the fertility and suitableness of a large proportion of that country for settlement by agriculturists. A map carefully corrected by field notes, and issued within the past few weeks by the Crown Lands Department at Toronto, shows that in the townships south of the lake and French River 95 per cent of the land is arable, and well wooded with birch, white oak, hemlock and balsam. It may be mentioned that the want of a steamer has been much felt by lumbermen in this district during the past year. It is not expected that the enterprise will be immediately successful from a pecuniary point of view, but there is such confidence in the future of that District that a Lake Nipissing Navigation Company will before long be formed."

Kinmount News.

Mr. Jabez Thurston, of Lindsay, had a practical engineer here a few days ago trying to purchase three acres of land of Mr. J. W. Gilmour, for a large steam mill here.

Several American gentlemen are now negociating with Mr. J. Crego, to purchase sites here for steam mills. We expect to have over eight or nine steam mills here soon.

Mr. M. Chase, who is a partner with John Dovey here at our new mill, is engaged in moving a 75 horse-power-boiler to the mill. The boiler contains 179 flues. It is the largest boiler which ever came to this locality. The mill is now enclosed and there are over 20 men to work at it daily. The mill is expected to start work in 14 days,—cutting boards and shingles for the American market.

Messrs. Paxton and Jones are now gettin out square timber and saw logs to build a large frame boarding house, 40 by 80. This house will be under the care of Thos. Baker,—who keeps the other boarding house at the iron mines.

New Processes in Milling.

All the Minnesota millers are now fighting the old-fashioned flour barrels. They say it is a relic of barbarism. They desire to substitute the cotton sack in its place. Cotton sacks holding a half-barrel of flour are worth ten cents apiece. Flour barrels are worth forty-five cents each. All the flour shipped to Glasgow and Rotterdam goes in cotton sacks. These sacks are worth as much there as here. The millers maintain that flour does not sift through a good cotton bag as much as it sifts through a barrel. Ten bags of flour were shipped to Glasgow, returned to Minneapolis, and sent again to Glasgow. When weighed they had actually gained in weight. Six hundred barrels of flour put up in bags and shipped to Glasgow will gain in weight one thousand eight hundred pounds. When New York flour dealers begin to handle flour in half barrel sacks, the people will save twenty-five cents on a barrel and have their good sacks left.

The old millstones are all being taken out and new steel rollers are substituted in their places. The wheat passes through five sets of rollers, each set closer than the former. These rollers are thirty inches long and ten inches in diameter. After passing between each set of rollers it is "bolted" or sifted through the cloth. The last rollers are hardly anything but wheat hulls and the waxy germs which do not crack up, but smash together. So flour is now cracked and disintegrated without grinding. The first rollers crack the kernels of wheat into say six pieces. The starchy substance which rattles out drops through the cloth sieves or bolting cloth. These six pieces are broken between the next rollers in thirty-six pieces. Then the white starch crumbs are sifted out again, and the thirty-six pieces are passed between still tighter rollers, which crack them into 216 pieces; another set of rollers multiply each of these particles into six more, making them aggregate 1296. Another set of rollers screwed together with tremendous pressure makes 7776 pieces. The scientific miller says a grain of wheat is finally cracked into 7776 pieces without being ground at all. This is the Hungarian process. The germ of a kernel of wheat is a waxy substance not fit to eat. Between stones this germ grinds into the flour and damages it. By this new process of the Hungarian rollers this germ is flattened out, and it is bolted out. However, it is finally ground up with the debris on stones to make the low grade flour, which we sell in Rotterdam for $2.50 per barrel.

ST. LAWRENCE LUMBER TRADE.—The figures relating to the lumber trade of the St. Lawrence with South American ports, for the season just closed, have been published. They show that the total shipments of sawn lumber were 10,286,184 feet, four-fifths of which quantity was sent from Montreal. It was expected that a heavier business would have been done during the season, but the trouble between Chili and Peru has had a depressing effect upon trade; and though the above figures are on a par with those of recent years, they do not compare in amount with the operations of the earlier years of the decade just closing. In 1872 and 1873 the shipments were twenty-eight million, and thirty-six million respectively.

ARNPRIOR LUMBER TRADE.—The Arnprior *Chronicle* says that Messrs. McLachlin Bros., of Arnprior, are making extensive arrangements to meet the wants of the lumber trade next season. They are rebuilding the waterways leading to their mills, and putting everything in order to insure an early start in the Spring. They contemplate the erection of a large steam mill here next summer, which they expect to have in running order early in the Fall. About 700 men are employed by this firm in getting out logs and square timber on the Madawaska and Conlongo this Winter. The firm recently purchased a new limit of 100 miles on Opeongo Lake. They have now four large limits, situated on the Madawaska, Bonnecherre, Coulonge and Petawawa streams, and we learn that it is their intention to carry on lumbering operations on a most extensive scale.

MINING NOTES.

WHEELING, W. V., Jan: 5.—The strike of coal miners in this vicinity has caused iron mills and glass factories to suspend, throwing 5,000 men out of employment.

WHEELING, West Va., Jan 5.—A strike of coal miners in this vicinity has caused the iron mills and glass factories to suspend, throwing 5,000 workmen out of employment.

TAKON RIVER.—Marvellous stories of the richness of quartz from the Takon River diggings are told. The specimens are very rich. The mines are believed to be in Canadian territory.

THE Brockville *Recorder* says, Mr. Caldwell, of the firm of Boyd & Caldwell, opened a new mine on the 1st inst. in the township of Lavant. The ore taken from it is of the very best quality.

THERE is good authority for stating that such is the rush to secure and develop mining properties of one description or another in Nova Scotia, the Provincial Government will realize about $100,000 a year from mining licenses, royalties, &c.

THE BEAUCE MINES.—The Canada Gold Mining Company of the Gilbert River, Beauce County, are employing fifty men. The operations of this Company are conducted, it is said, in keeping with their pretensions, which are solid and substantial.

A SENSITIVE MULE.—Employees of the Streator Coal Company attempted to lower a fresh mule into the mines. When the cage started down the animal was overcome with terror, and when they went to take him from the cage they found he had died of fright while descending.

OTTAWA MINING.—The phosphate interest is looking up. Some fifty men are constantly employed in mining operations in the Du Lievre district. There are 3,000 tons ready to bank on the river, and hauling to Buckingham station has begun. It is estimated that some $75,000 will be paid for teamlng alone this winter.

SILVER ISLET.—A gentleman well acquainted with Silver Islet, states that, from the silver ore now within view, and from the general results of drilling operations, he is of opinion that there is still between $50,000,000 and $60,000,000 worth of silver in the mine. He thinks that there is little doubt but the Pie, Victoria and Duncan mines are almost equally rich. A very valuable gold mine has recently been discovered some distance from Prince Arthur, and the vein traced a distance of six miles. The mining interests of the Thunder Bay region certainly never appeared more promising than they do now.

THUNDER BAY.—The North Shore *Miner* says Mr. Amos Bowerman came up from the Thunder Bay Iron Mine last evening, accompanied by one of the miners. He brings with him several specimens of the ore taken from the vein. He informs us that the prospects are looking brighter and brighter every day, as the work advances. The men are still at work uncovering the vein, no ore of any amount being taken out. Everything is being got in readiness for the extensive development to be carried on next season. Mr. B. returns again in a day or two.

The St. Ouge Company have sold out to a Mr. McArthur, of Toronto, who is working his mine with quite a force of men. Lot 13, owned by Messrs. J. Ainsworth & Co., of New York, employs a few men, and the results have not been very favorable. Under a sworn statement before the Mining Inspector, of this District, ending 31st October, the yield was but ninety-one ounces. At $17.50 per oz. this would be in round numbers $1,592.50. The time taken to get this amount of gold will date from the month of August until 31st October, about two and one-half months. This last-named Company's pay rolls amounted to $2,000 and upward per month, showing a serious loss to the Company. The property of this Company is now under seizure for debt due labor and goods furnished. This is the second New York Company which beginning under fair auspices have fallen short.

EAGLE HEAD MINE, C. B.—A correspondent describing the mine says:—The property consists of one square mile—is situated on the North Shore of Gabarus Bay;—contains three lodes of ore, measuring, respectively, 90, 45, and 36 feet. Other lodes are known to exist on the property, but have not yet been prospected. The analysis show a good per centage of Copper and Bismuth, and a small percentage of Silver and Lead, with a trace of Gold, and some other minerals in small quantities Ore can be taken out nearly as fast as it can be shipped. The facilities for shipping are excellent, as vessels can load within 100 yards of the mine. Should the ore give satisfactory returns, the prospect of a great mining establishment at Eagle Head is very certain. The property has just changed hands—Messrs. McKinnon and McKenzie were the former owners, and McLellan and Fearn, of Halifax have recently bought the property, and are now operating it with good prospects of success. Mr. McLellan is Manager.

A TOUCHING STORY.—One rarely meets a bit of more touching romance than is found in the following story that comes from Wales: "Years ago some Welsh miners, in exploring an old pit that had long been closed, found the body of a young man dressed in a fashion long out of date. The peculiar action of the air of the mine had been such as to preserve the body so perfectly that it appeared asleep rather than dead. The miners were puzzled at this circumstance; no one in the district had been missed within their remembrance, and at last it was resolved to bring the oldest inhabitant—an old lady long past her eightieth year, who lived single in the village the whole of her life. On being brought into the presence of the body a strange scene occurred; the old lady fell on the corpse, kissed and addressed it by every term of endearment, couched in the language of a bygone generation. He was her only love; she had waited for him during her long life; she knew that he had not forsaken her. The old woman and the young man had been betrothed sixty years before. The lover had disappeared mysteriously, and she had kept faithful during that long interval. Time had stood still with the dead man, but had left its mark on the living woman. The miners who were present were a rough set, but very gently and with tearful eyes removed the old lady to her house, and the same night her faithful spirit rejoined that of her long-lost lover."

A MOUNTAIN OF SILVER.—The captain of a whaling vessel just returned from the Arctic Ocean says that, while the vessel was lying in a small bay at the mouth of one of the rivers which empty into the ocean on the coast of Alaska, he, one of the mates and four men, went up the river to catch salmon. At the foot of a hill, bordering on the river, they commenced fishing. While the sailors were engaged in this work, the captain and mate ascended the mountain, which appeared to be about 400 or 500 feet high. Arriving at the top, they found what seemed to be the crater of an extinct volcano, and around were evidences that at one time there had been a terrible eruption. In the crater itself the captain noticed that the rocks resembled congealed iron after it had been melted, and undertook to knock off a piece, but could not do it, as it bent and did not break with his repeated blows with the head of a boat-axe. He then struck it with the blade of an axe, and actually chopped it off. He saw that the substance was as soft as lead, but it did not shine. He determined to bring it to San Francisco and have it assayed. One of the natives also brought a piece of rock about 12 inches long by 6 inches thick, which weighed 48 pounds and sparkled with gold, stating that he had found it near another hill further up the river and that such rock was plenty there. When the vessel arrived at this port, the captain told his story to a gentlemen living in Oakland, and the specimens were handed over to him for the purpose of having proper assays made. This was done, and the piece which the captain chopped off the top of the hill with the axe went $6,000 per ton in silver, and the loose rocks picked up on the side of the hill went as high as $275 of silver per ton. It seems, then, that this hill is a mountain of silver, and that it is only the beginning of vast discoveries which will soon be made in Alaska, which may yet become the El Dorado to which thousands will rush. The Oakland gentleman spoken of immediately formed a party or Company, which has chartered the whaler to take a trip to the scene of the remarkable find as soon as the season opens.—*San Francisco Chronicle.*

NEW BRIDGE.—The new iron railway bridge across the Ottawa above the Chaudiere Falls, just completed, is a fine structure, 2,160 feet in length. The first passenger train ran over it on Thursday last. It has been severely tested and the greatest deflection of any of the spans was but half an inch. The bridge is calculated to bear six times the pressure ordinarily to be put upon it. It will be used by the Q. M. O. & O. Railway, which will have a union station on the Ottawa side of the river with the Canada Central.

Schliemann.

A GLANCE AT THE EARLY DAYS OF THE GREAT DIGGER GIVEN IN HIS NEW BOOK.

Before plunging into the record of his discoveries Dr. Schliemann stops to tell the story of his life. It is such a one as we might expect from such a man, and shows how the work of his later life has been the natural consequence of the impressions he received in his earliest years, "The pick-axe and spade for the excavation of Troy and the royal tomb of Mycenæ," he writes, "were both forged and sharpened in the little German village in which I passed the first eight years of my childhood." Dr. Schliemann also thinks it necessary to relate how he obtained the means which enabled him in the autumn of his life to realize the great projects formed when he was a little boy. With a scholar's simple mindedness he flatters himself "that the manner in which I have employed my time as well as the use I have made of my wealth will meet with general approbation." Dr. Schliemann need feel no doubts on that point. There may be a few to cavil, but their idle tongues are drowned in the applause of the multitude. This distinguished explorer was born on the 6th of January, 1822, in the little town of Neu Buckow, in Mecklenberg-Schwerin, where his father was Protestant clergyman, and from whence he moved in 1823 to the village of Ankershagen, in the same duchy. In Ankershagen the young Schliemann spent the first eight years of his life. The neighbourhood was as full of tradition as it was of ruined castles, and the imagination of the boy had full sway. Near the Schliemann cottage was a tomb in which the body of an infant and countless treasures were said by the village gossips to be buried. Nothing but the stern command of his father prevented the child from beginning his excavations then and there and proving the truth or falsity of the village tongues. Though the elder Schliemann was neither a scholar nor an archæologist, he had a passion for ancient history, and the first stories he told to the child at his knee were of the Homeric heroes. When nearly eight years old the reverend Schliemann presented his son with a volume of Dr. Jerrer's "Universal History," containing an engraving representing Troy in flames, with its huge walls and Scæan gate, from which the good Æneas was escaping with his father on his back. This picture convinced the boy that Troy could not be utterly destroyed. "Father," he cried, with a precocity that must have carried conviction "if such walls once existed they can not possibly have been completely destroyed; vast ruins of them must still remain, hut they are hidden away beneath the dust of ages." They argued the question awhile, and the son climbed down from his father's knee, vowing that he should one day excavate Troy. This idea so filled his mind that he could not enter with spirit upon his dancing lessons, and his teacher complained that his heels were as heavy as his head. At the age of 14, the affairs of the family made it necessary for him to leave his studies and go to work. He became a grocer's clerk, but his heart lay buried in Troy. With the coffee bags on his back he was Æneas rescuing his old father from the flames; dealing out molasses to petty-maids, he was Paris offering bumpers of wine to Helen. Fve years of this drudgery did not change his determination. After various mishaps he got a situation in the country house of an indigo merchant in Amsterdam. Here he saw an opportunity to rise. The lever he used was hard work. At first he took writing lessons to improve his unclerical penmanship. Afterward he began the study of languages. His salary at this time was $160 per annum, half of which was spent on his studies. On the other half he lived "miserably enough." His lodging, which cost eight francs a month, was a wretched garret without a fire, where he "shivered with cold in winter and was scorched with heat in summer." His breakfast consisted of "rye-meal porridge," and his dinner never cost him "more than two pence." But nothing, he exclaims, "spurs one on to study more than misery and the certain prospects of being able to release one's self from it by unremitting work." He studied English and French, and mastered both in a year's time. Dutch, Spanish, Portuguese, Italian, and Russian followed, and later Latin and Greek. Such a man could not fail to attract the attention of his employers, for he delved as hard at learning the indigo business as at Greek roots. He rose step by step. He was sent to St. Petersburg in 1846 as agent for his Amsterdam employers, but gradually becoming richer he set up for himself. In 1850 he went to California to look for a brother, whom he found dead; but the newly annexed country was made a state on July 4 of that year, and as, says Dr. Schliemann, "all those then resident in the country became by that fact naturalized Americans, I joyfully embraced the opportunity of becoming a citizen of the United States." In 1858 he thought he had money enough to retire, and traveled over northern Europe, Italy, Egypt and Palestine. A lawsuit brought him back to business to St. Petersburg, where he made more money. In 1863 he again found himself rich enough to retire, so he gradually liquidated his business, and as a preliminary holiday to his life work began in 1864 a tour of the eastern world, crossing back by way of San Francisco, and writing his first book, "China and Japan," on the voyage. He came by way of Nicaragua to the eastern States, visited Havana and Mexico, "and in the spring of 1866, settled down to the study of archæology henceforth, with no other interruption than short trips to America."

Another Cliff Town Discovered.

The occurrence of ancient cliff towns, built upon or rather in almost inaccessible places along the precipitous sides of river canons in Colorado and New Mexico, was made known several years ago. Another very important discovery of this nature was made a short time since by Mr. James Stephenson, of the U. S. Geological Survey, in New Mexico. The city lies in a canon thirty miles long, never before visited by white men, and is about forty miles from Santa Fe and ten miles from the Rio Grande. It consists of a succession of excavations in the solid rock throughout the length of the canon, making, perhaps, the largest cliff town yet discovered.

The houses are dug out of the rock side to a depth of from fifteen to twenty feet. Apparently they were exchavated with stone impliments. They are almost inaccessible from the plains. Mr. Stephenson, however, managed to clamber up the rocky precipice, and entered and examined a number of articles that he thought remaind of their first possessors. A scientist who had traveled in that region and visited other caves and exchavations of a similar kind says he is disposed to believe that they have been tenanted within modern times by Indians at war with other tribes, seeking safety and advantage over their enemies. He thinks the remains found there are the remains of the things these belligerents have used, eaten, or worn, and not the relics of the first owners of the rock houses.

Exhausting the Wheat Lands.

(From the Pall Mall Gazette)

There is one point in American competition with England which, though it has now and then been touched upon, has never been thoroughly worked out. America is undoubtedly reducing the rent of land in England by the amount of food which she is enabled to send over here at a cheap rate. In this way, too, land of inferior quality in England is going out of cultivation. But all this grain which is sent represents really so much valuable manure. Instead of using it we silt up our rivers with the sewage of our large towns, and millions' worth of fertilizing agents are year after year swept into the sea. This is bad enough by itself. What is worse, however, is that each successive wheat centre in the United States is more rapidly exhausted than the one before, owing to the excessive over-cropping and the want of manure. Thus, the soil in the United States is undergoing deterioration to supply us with the necessaries of life, while we who receive the food allow our soil to go out of cultivation when the very substances we receive would if properly used enrich and fertilize it. Posterity, perhaps will think we had very curious ways of dealing with their planet.

A FAMILY never becomes extinct in Japan. If there are no male descendents, a young son of another family is adopted, and takes the family name.

A lecturer once prefaced his discourse upon the rhinoceros with, "I must beg you to give me your undivided attention. Indeed, it is absolutely impossible that you can form a true idea of the hideous animal of which we are about to speak unless you keep your eyes fixed on me!"

How they get India Rubber in Africa.

(From the Rubber Era.)

Having passed fully three years on the southwest coast of Africa, as trader for an English firm, I will endeavor to describe the manner in which India rubber is procured in that country, as India rubber formed the staple produce of the district were I was located.

The natives are in a very rude, uncivilized condition. They have no currency, and do all business by battering the native products for manufactured stuffs. Their wealth consists chiefly in the number of slaves they possess, who fish, hunt, and keep their plantations in good order.

When rubber has been collected, from four to ten slaves get their flint muskets in order, each carrying, in addition, a long sword-shaped knife called a machete, a number of calabashes or jars to collect the juice of the rubber vine, and a little food that as been cured in smoke, as they can find plenty of sustenance in the bush without carrying it about with them from place to place.

The vine are in some cases near to the towns, but generally the natives have to go several day's journey into the bush before they can sit down and commence business. The vine itself is of rough, knotty nature, about as thick as a man's arm, and grows to a length of fully two hundred feet. Its leaves are are glossy, like those of the South America trubber tree, and a large fruit much liked by the natives, is gathered from it. I have tasted it, and found it very palatable, being slightly acid. This vine (what its scientific name is I don't pretend to know) yields several grades of rubber, each of different commercial value, the best quality being taken from the highest part, and the poorest from the bottom.

With their knives, or machetes, the natives slash the vine in several places, and put broad leaves directly underneath the wounds for the juice to drop on, and which, being of a strong, adhesive nature, none of it may drop on the branches of the tree, and so get lost; but it is not often they trouble themselves climbing, unless the vines happen to be scarce in the vicinity. The entire day they devote to cutting; next day they gather what was cut the day previous, and so on. Each evening, after collecting, they put all the juice they have into several iron pots, or earthern vessels of native manufacture, and boil it; at the same time they can greatly improve the lowest quality by adding a little salt, and the more they boil the juice the better it becomes. When sufficiently boiled the water is poured off and the juice is allowed to cool, when it is fashioned according to the grade—ball, flake, mixed, or tongue—and is ready for the market. In this way about twenty or thirty pounds a day is generally collected. It is then taken to the factory, and there exchanged for guns, cloth, rum, &c. When it is received at the factory it is carefully marked, classed, weighed, and put into casks for shipment. It contains so much water that twenty per cent. is deducted from the weight of each cask, as that is about the amount of shrinkage on the voyage. This is, however, a loss to the native, as it is deducted from him when selling.

This vine, from my personal observation, is to be found from Sierra Leone in the north to Vunsembo in the south, but along the coast line it is rapidly becooming extinct, as the natives are so careless or repacious that in many cases they completely sever the vine, thus killing it, instead of simply bleeding it.

An Ice Cave in Monta.

Two explorers named Lambert and Caruthers discovered, last summer, a large cave on the Dry Fork or Arrow Creek, in the Bell Mountains, in which was half an acre of solid ice of unknown depth. At the time of the discovery, about August 1, the ice was covered with ten inches of water, which prevented, a thorough exploration of the Cave. The Fort Benton *Press* says that the ice gives every indication of being in a great body, and it is believed, from its appearance, and the fact that in the hottest season only a few inches of it was melted, that it is perpetual. The cave is described as being a great resort for game, as all kinds were killed close to its entrance.

UNCOMPROMISING.—The doctor's daughter—"I declare you're a dreadful fanatic, Mrs. McCizzom. I do believe you think nobody will be saved but you and your minister!" Old lady—"Aweel, my dear, ah whiles I hae my doobts aboot the meenister!"

SCIENTIFIC GOSSIP.

Dr. Maclaren, of Edinburgh, Scotland, states that the types of insanity have changed within modern times. For instance, acute delirous mania is now comparatively rare, but mental enfeeblement attended with paralysis is becoming more and more common, and is the result of the overwork and worry of the struggle for existence at the present day.

The Russian Government is well pleased with the new torpedo-boat called the Batoum, which has been thoroughly tested in the Black Sea. This vessel is 100 feet long, and carries two torpedo guns, built into her hull forward, for discharging Whitehead torpedoes. In the boats of the same class now building there will be three torpedo guns forward instead of two. The Batoum behaves excellently at sea, and makes 22 knots an hour.

A very powerful electric light of the Brush system was exhibited on Nov. 29 at the London works of the Anglo-American Electric Light Company. The lamp, of the ordinary Brush type, carried carbons 1.25 inches in diameter, and the energy of the current was so strong that the carbons were raised to a white heat two inches from the arc. The photometric power of the light is said to be 47,000 standard candles.

Neither the cool walks of science nor the deep shades of the descent of the hill of life seem capable of subduing the hot blood or tempering the fiery language of some men. The *Medical Press and Circular* says: "A most painful scene has occurred at a session of the Paris Academy of Medicine. During a warm discussion on the cholera of fowls, M. Guerin addressed M. Pasteur in the following words: "You are a liar, Sir; I will send you my seconds." Yet M. Guerin is an octogenarian and M. Pasteur hopelessly paralyzed on the left side.

M. A. Colson thus describes the manufacture of phosphoric acid in the *Bulletin* of the Chemical Society of Paris: "Natural phosphates, underground, are dissolved in dilute hydrochloric acid. When the acid has ceased to act the clear solution is run off from the insoluble matter and mixed with sulphuric acid enough to saturate all the dissolved lime, leaving a mixture of hydrochloric acid, diluted phosphoric acid, and calicium sulphate. This mixture is submitted to pressure to separate the sulphate from the free acids, which are then concentrated, and the hydrochloric acid is condensed and collected for use by means of ordinary columns.

From a comparison of the result of recent deep-sea soundings, it appears that the following are just generalizations: 1. The water of the North Pacific is in its whole mass cooler than that of the Atlantic. 2. The water of the South Pacific is, down to 4,225 feet, somewhat warmer than that of the Atlantic, but below that depth colder. 3. The bottom temperatures are generally lower in the Pacific than in the Atlantic at the same depths and in the same degree of latitude; but nowhere in the Pacific are found such low bottom temperatures as in the Antarctic portion of the South Atlantic, where temperatures of—0.3° Centigrade to —0.6° have been measured. 4. In the western parts of the Pacific and the adjoining parts of the East Indian Archipelago the temperature of the water reaches its minimum at depths between 1,787 and 8,937 feet, remaining the same from this depth to the bottom. In the whole of the Atlantic the temperature from 8,937 feet to the bottom gradually, though slowly, increases.

A very interesting lecture was recently delivered before the Anthropological Institute, London, by Mr. J. F. Rowboeham, on the different stages in the development of the art of music in prehistoric times. Although, he said, the varieties of musical instruments may be counted by hundreds, yet they are all reducible under three distinct types: 1. The drum type. 2. The pipe type. 3. The lyre type. These three types are representative of three distinct stages of development through which prehistoric music had passed, and in the order just stated. The first period in the development of music was the drum stage, in which drums and drums alone were used by man. The second was the pipe stage, in which pipes as well as drums were used. The third was the lyre stage, in which stringed instruments were added to the stock. There three stages answer respectively to rythem, melody, and harmony. In the musical history of mankind the lyre stage is never found to precede the pipe stage, nor the pipe stage to precede the drum stage.

The Sultan s Levee.

POMP AND CEREMONY AROUND THE REPRESENTATIVE OF THE BANKRUPT OTTOMAN EMPIRE.

We assisted at the grand Bairam ceremonies at Dolma Baghiche palace yesterday. The Sultan holds a levee, and receives all the ministers, officials, and officers, who congratulate his majesty and wish him a prosperous Bairam or festival. The diplomatic body was ushered through a number of lofty passages, through countless salons blazing with gilt, Damascus silks and marqueterie, into what is considered the most magnificent throne-room in the world. It is a gigantic oval, with glittering wood floor and whose roof is upheld at an immense height by splendid Corinthian colums of fluted marble, of that fine pink-veined quality only quarried at Lesbos. Every inch of the roof is covered with a fresco painting of such artistic style that it can hardly be distinguished from groups of flowers, arabesques, etc., in bold relief. Great windows let in the glorious light of day at either end, and near one of those windows was the throne, at that moment unoccupied. It is a low, wide sofa, about five feet long, whose back, legs, and sides,are covered with plates of gold, and covered with a red silk cushion studded with stars.

When we entered the Salle du Trone it was filling with the throng of government officials, some of whom had come from long distances to pay their court to their sovereign. One venerable snowy-bearded pasha was pointed out to me as the governor of Hedjaz, the most distant Turkish vilayet, and who had spent nearly three months en route. This glittering array of uniforms was slowly placing itself in a double line all around the hall, and more were pouring in constantly and taking their places. The cabinet ministers, prominent among whom was Behram Agha ,the chief eunuch, an attentuated old "darkey" in a gold-bespattered dress coat, placed themselves in a line standing, behind the gold divan. Without an exception, they all wore the grand cordon of the Osmanie with the "Cracket" in brilliants. Pretty soon about 2,000 persons were in, all in full uniform, officers in epaulettes and swords, muftis in flowing robes of green, purple, cream-white, and blen tendre with tight, black coats showing off well with their splendid figures, with the double range of silver cartridges on each breast, and their Astrachan caps half concealing the classic features of descendants of the oldestrace in Asia.

Presently a sort of thrill runs through the line of patient officials, each man steps well into line, adjusts his gold collar, tilts the fez a fraction of an inch further back. gives a last tug at his new gloves, the folding doors at one side near the throne are flung open; and welcomed by a pealing crash from the Imperial Band in the gallery, the autocrat of Turkey slowly steps into view and takes his place on the throne. A concealed chorus then sang, or rather shouted, a species of short song of praise, and every Turk present bowed in an humble salaam. This is done, I may explain, by scooping up an imaginary handful of dust, and rapidly placing it on the lips and forehead, the depth of the "scoop" being in direct proportion to the rank of the *salutee.*

The ceremony of the Rikiab, or "submission," which consists of kissing an embroidered scarf held by the grand master of ceremonies, in lieu of the Sultan's hand, then began. The cabinet ministers fell in line, followed by ex-grand vizers, generals, admirals, murtis, and so on down to the small fry. Each one salaamed when within three yards of the Sultan, did so again just before kissing the scarf, did so immediately after, then backed off a few paces and made another salaam. This being done very solemnly and very methodically, two or three hours elapsed ere the last fez had bowed before the sovereign. The band had at intervals played in excellent style several pieces among which the Turkish national air, "The Hamidie," a spirited march was prominent.

The sultan then rose, made a slight but comprehensive bow, returned by a low salaam from the two thousand courtiers, and disappeared from behind the folding doors, at each side of which a splendid Circassian then placed himself, in a martial attitude.

We were about to wrap up and leave, when a stout aide-de-camp appeared among the little knot of visitors, and informed us that, as a great exception, the sultan would be graciously pleased to receive us all personally. We numbered about fifteen. There were Count Hatzefeldt, the German ambassador; Mrs. Tyrell his sister; Mrs. Goschen, Mme. de Novikoff, wife of the Russian ambassador; the Spanish minister's wife in a gorgeous dinner dress (!), a small party of Englishmen from the Pandora, Hon. W. H. Smith's yacht, and the American party consisting of Gen. Longstreet, our minister, who arrived the day before, Mr. Robert Hooper, jr., and your correspondent. We passed into a small blue-satin room, and found the sultan standing near the threshold, with two officers behind, him and Munir Bey, his interpreter, at his side. We were all presented, and bowed and shook hands silently with his majesty. Abdul Hamid wore a long blue coat of very antiquated cut, black trousers with a broad red stripe, the single star of the Osmanie, and a broad green-and-red ribbon crosswise on his chest. He is a little under the average height, with a sallow, anxious face and a thin black beard, and with deep crowsfeet and forehead wrinkles. His smile, however, was remarkably pleasant, and his voice low and musical.

As we left the presence, he invited us to come another day and visit the palace—a rather unusual piece of courtesy.

The Stormy Petrel.

The stormy petrel, known to sailors as the Mother Carey's children, is hated by them after a most illogical manner because it foretells an approaching storm, and therefore by a curious process of reasoning is taken for its cause.

This bird has long been celebrated for the manner in which it passes over the waves, pattering with its webbed feet and flapping its wings so as to keep itself just above the surface. It thus traverses the ocean with wonderful ease, the billows rolling beneath its feet and passing away under the bird without in the least disturbing it. It is mostly on the move in windy weather, because the marine creatures are flung to the surface by the chopping waves and can easily be picked up as the bird pursues its course. It feeds on the little fish, crustaceans, and mollusks which are found in abundance on the surface of the sea, especially on the floating masses of algæ, and will for days keep pace with a ship for the purpose of picking up the refuse food thrown overboard. Indeed, to throw the garbage into the sea is a tolerably certain method of attracting these birds, who are sharp-sighted and seldom fail to perceive anything eatable. It is believed that the petrel does not dive. The word petrel is given to the bird on account of its powers of walking on the water, as is related of St. Peter.

It does not frequent land except during the breeding season, and can repose on the surface of the ocean, settling itself just at the mean level of the waves, and rising and falling quietly with the swell. The petrel breeds on the northern coasts of England, laying a white egg in some convenient recess, a rabbit burrow being often employed for the purpose.

This bird possesses a singular amount of oil, and has the power of throwing it from the mouth when terrified. It is said that this oil which is very pure, is collected largely in St. Kilda by catching the bird on its egg, where it sits very closely, and making it disgorge the oil into a vessel. The bird is then released and another taken. The inhabitants of the Faroe islands make a curious use of this bird when young and very fat, by simply drawing a wick through the body and lighting it at the end which projects from the beak. This unique lamp will burn for a considerable period. Sometimes the petrel appears in flocks, and has been driven southward by violent storms, some having been shot on the Thames, others in Oxfordshire, and some near Birmingham. The general colour of this bird is sooty black, and the outer edge of the tertials and the upper tail coverts are white. Its length is barely six inches.

MARY STOVER took a dose of strychnine. A pet poodle licked her face while she was in her agony, and the poison on her lips killed the dog. The woman will recover.

NOT even the physician can know everything. When a doctor told a young man that he must go to the river side every morning for a bath the youth replied that the water at this time of year is too cold. "Well, you must have the bath," said the doctor, as he finished writing the prescription, "and if the water is too cold you must put your overcoat on."

Sanitary Reform.

The London Society of Arts recently discussed the feasibilty of keeping a sanitary record of every house, so that the Health Board of a town should be able to give an intending purchaser or tenant a certificate of its healthworthiness. The debate made it apparent that, in the case of old houses especially, sufficient pertinent facts could not be obtained to justify such certificates.

It is easy to see how greatly they might affect the value of property; and therefore they would prove exceedingly mischievous and outrageous if they were not scientifically accurate. And that it is not possible to make them in every case, nor even in the majority of cases. Sanitary inquiry has certainly not yet reached a stage where it can point out with confidence the exact and immediate causes of disease, and fix the blame for them with absolute precision. We call it a science, just as we call political economy a science; but strictly, the term is of course misused. It may become a science, but the day is yet far off.

When municipal authorities assume to pass judgment on the healthfulness, and consequently the value, of the premises owned by individuals, they should be very sure of their facts, and that they have enough of them to form an opinion on. They can now point out remediable nuisances, and palpable defects in sanitary engineering; but if they undertook to give medical certificates as to the comparative healthfulness of the different houses throughout a town, they would be certifying to matters about which they are plainly incompetent to form an opinion of value. No dozen physicians would agree on the subject.

But, in his recent address before the American Public Health Association, Dr. J S. Billings, its President, advocated modification of the plan suggested in London. He would have the health officer of a place obtain and keep a brief description of all its houses from a sanitary point of view. This would be merely a record of facts, to which individuals proposing to buy or rent houses could have access on the payment of a fee. The Health Board would express no opinion, but simply give a sanitary history of the property, its connection with sewers, the number and the causes of the deaths which had occurred in it, or in the square in which it was situated, and other information of that sort. It would be a sanitary supplement to the record of title, and of course might have a decided effect on the value of the property.

But Dr. Billings's plan, pretty as it is in theory, would involve so much minute detail that it would not be feasible in any municipal government on a large scale. To carry it out there would need to be a great multiplication of sanitary inspectors, and their official visits would become odious to the people. Moreover, the number of deaths occurring in a house may afford no certain indication of its condition as to healthfulness. People may take there the diseases of which they die, and an evil name be given a dwelling which it does not deserve. Property owners would justly cry out against a system of registration which put the value of their buildings in peril by following theories of the origin of disease which are not yet firmly established.

What is called sanitary science promises to become of the greatest benefit to communities. It has already demonstrated its value both here and abroad, for its tendency is obviously in the right direction—that of the prevention of disease. It has undoubtedly helped essentially to bring about the increase in the average of life which this century is showing; and it is not too much to expect that it will in the future obtain a pretty complete mastery over epidemics, though yellow fever and even typhoid fever now baffle its efforts to discover and remove their causes. But there is a growing number of men, laymen rather than physicians, for the most part, who make a hobby of sanitary inquiry, and treat it as if it was a fully fledged science against which there could be no reasonable rebellion. Dr. Billings has too high and justly deserved a reputation to lend himself to the support of the crotchets of these fanatics; but such a proposition as his is likely to be run into the ground by them.

There is, however, a sensible effort now making to effect in part the end he would attain. It is to secure the passage of a law by the Legislature requiring that when specifications for building are filed, there shall go with them specifications of the plumbing and house drainage. These would enable an export to form an opinion as to a house's protection against sewer gas, and show him its sewer connections.

GENERAL

The town of Hull, England, is to have its streets lighted by the Siemens system of electric illumination.

THE resumption of specie payments in Italy is opposed by capitalists and speculators in gold; yet a forced currency is no longer needed, as the country is peaceful and advancing in manufactures, and last year there was an excess of $42,294,000 in receipts over expenses in the budget. Parliament has voted to adopt a resumption policy.

THE famine in Russia, it is predicted, will assume proportions altogether beyond previous estimates, and no steps are taken to meet it. The Russian peasant cannot afford at the best of times to eat wheat, and this grain has been sold long ahead to the Jews and other middlemen. What is needed is an immediate importation of cheaper grain, if such can be obtained.

A BUG has turned up in Asia Minor which feeds uponthe eggs of the locust. Where a cluster of locust eggs is examined the destroying insect appears in the midst of them. Locusts from time immemorial have made themselves disliked in Asia, and the new bug, which is believed deposits its eggs in the live locust's body, has general sympathy and encouragement.

A SCHEME is under consideration for a canalacross the Malayan Peninsula, by which it is believed that English mails may be delivered in Hong Kong in twenty-nine days and a half, a saving of nearly seven days by the present route. The line would be from Bombay to Madras by mail, thence across the Bay of Bengal, and by the canal over the peninsula into the Gulf of Siam, and thence direct to Hong Kong.

ALTHOUGH Brazilian coffee makes up about one-half of the quantity produced in the entire world, it seems to be held of so little account in the markets that, to insure a sale, it has to be labelled as Java, Porto Rico, Ceplon, or Mocha praduce. In the country there are no fewer than 350,000,000 plants, covering 1,500,000 acres, and yielding a crop of 260,000 tons of which 50,000 are retained for home consumption.

ACCORDING to the imperial budget, the German army on a peace footing, as supplemented by the accession of strength recently voted, now consists of 18,128 officers, 427,274 men, and 81,629 horses, the addition including 901 officers, 25,615 men, and 1,736 horses. Of these Prussia receives eight new infantry regiment and one battalion with one field artillery regiment, twenty-four field batteries, and one fortress artillery regiment, the rest being distributed in small proportions between Saxony, Wurtenburg, and Bavaria. The greater part of this new force will be garrisoned in towns nearer the Russian frontiers, an arrangement which is perhaps due to the existence of better barrack accomodation in the east than in the west.

ACCORDING to the St. Petersburg correspondent to the *Cologne Gazette,* a Supreme Council of State is to come into existence in Russia at the Russian new year. This council is to carry on all the business of the empire independently of the Czar, the latter retaining the decision only of questions of war and peace. His union with Princess Dolgorouki will be proclaimed as a legal marriage, without her becoming, however, Empress. She is to receive the title of Duchess of Holstein-Gottorp, and her children will be princes and princesses of the same name. Henceforth the Czar is expected to live with his family in retirement at Livadia, remaining Emperor in name, but, so far as Russian circumstances permit, transferring the cares of business to his son.

IN clearing away the remains of one of the ruined Bastions of Yedi-koule, near Constantinople, the agents of the Prefecture discovered a large quantity of gunpowder, the existence of which was not before suspected. Information was at once sent to the Ordinance Department, whence an expert was despatched to examine the powder. Powder, strickly speaking, it was not, for the grains was as large as filberts; but a grain thrown into the fire showed that the composition was of a highly explosive character, but the expert could not precisely determine what the quality was without submitting it to analysis. The powder is believed to have been deposited where it was found prior to the conquest of Constantinople by Mohammed the Second.

THE CANADA LUMBERMAN

AND MILLERS', MANUFACTURERS', AND MINERS' GAZETTE.

ISSUED SEMI-MONTHLY AT TORONTO, ONT.

A. BEGG, - Proprietor and Editor.

TERMS IN ADVANCE (Post-paid):

One Copy one year..... $2 00
One Copy six months..... 1 00

ADVERTISING RATES

$1 50 per line per year; 85 cts. per line for six months; 50 cts. per line for three months.

Small Advertisements 10 cts per line first insertion 5 cts. per line each subsequent insertion.

Business Cards, Forms of Agreement, Bill Heads, &c,. promptly supplied to order, at the LUMBERMAN Office.

Communications, orders and remittances should be addressed to A. BEGG, LUMBERMAN Office, 33 Adelaide Street West, Toronto.

NEWSPAPER DECISIONS.

1,—Any person or persons who takes a paper regularly from the post office, whether directed in his name or another's, whether he has subscribed or not, is responsible for payment.

2.—If a person orders his paper discontinued, he must pay all arrears, or the publisher may continue to send it until payment is made, and then collect the whole amount, whether the paper is taken or not.

TORONTO, ONT., JANUARY 15, 1881.

HEMLOCK TREES AND BARK.

In view of the fact that the pine is being rapidly stripped from the districts of Muskoka and Parry Sound, a Bracebridge correspondent thoroughly familiar with the subject, calls our attention to the great destruction of hemlock, which is taking place in those districts to supply tan bark. He estimates that there are about 10,000 cords of hemlock bark peeled annually in that region, and assuming that seven trees of an average diameter of 13 in., and 36 feet in length will furnish a cord of bark—would equal 3 saw logs of 13 inches diameter, which by Scribner's rule gives 219 feet of lumber: or 10,000 trees would make 15,320,000 feet. This has been going on for the past four years, so there must have been 61,320,000 feet of lumber felled during that time, but not more than one million feet of this large amount has been manufactured into lumber. The balance has been left to rot in the woods, or which is far worse, to make kindling wood for the first bush fire which may happen to break out near by, and which might destroy the greater part of the valuable pine or hemlock left standing. As long as pine stumpage is cheap, and as long as pine can be obtained, no one cares to go into manufacturing hemlock lumber; and as tanners must have bark the waste will go on and the wood left useless. A portion of this bark is peeled on patented lands, but the greater portion, our correspondent says, is cut on Crown Lands without leave or license, and it is about time the government took some steps to stop this waste, as the day is not far distant when hemlock will be of more value than the pine now is. In some places, the bush is so slashed down that the refuse seriously interferes with getting out the pine.

We trust the local member for Muskoka will give the matter his attention. Hemlock may yet be required to form a plank of the Commercial Union with the United States, advocated by that honorable gentleman.

GENEROUS.—Messrs. Rathbun last summer, when the men in their employ at the Eagle Mill, Ferry Point, threatened to strike for higher wages, promised if they would not do so, to divide $500 among them at the close of the season The promise was kep and the money divided among the men at Christmas,

DYES FROM SAW DUST.

Mr. John Blair, of Ardtrea, near Orillia, writes to the *Times*, and says he noticed in a late issue of that paper, an article devoted to the description of a new process whereby certain waste products, such as sawdust and decayed wood are converted into dyes of various shades. Some three years ago, he continues, I discovered and perfected a process for the manufacture of dyes from sawdust, wool, hair and horn. At that time I furnished several leading chemists with samples of the new substance, which on account of its close resemblance to certain products formed from indigo is of considerable interest. This compound (which I have termed xanthogen) can be manufactured in large quantities from sawdust, or from almost any organic material. One ton of sawdust when transformed into xanthogen would be worth at least $500; and the same weight of old woollen rags when subjected to the same process would be worth more than $2,000. The above estimate would seem incredible were it not that I am in a position to verify its truth. It will be seen from these figures that there is a mine of wealth in sawdust and old rags for the enterprising capitalist. There are many other ways in which sawdust can be utilized, as for instance in the formation of Prussian blue. A mixture of sawdust, iron filings and a small percentage of potash if heated in an iron retort till all the volatile products pass off, and then if the retort be closed so as to exclude the air and the heat raised so as to fuse the contents, and then if a current of pure nitrogen gas be passed through it the iron will at once be converted into Prussian blue. The nitrogen gas can be easily obtained from the atmosphere by passing a current of air through ignited charcoal and afterwards through a column of iron ore which is to be kept heated to a temperature of 2,200 Faht. After the heated gas passes through the ore the carbonic oxide is converted into carbonic acid and the ore is reduced to a spongy metallic state, and we have now a mixture of C.O2 and nitrogen, which when stored in a gas meter through which lime water is circulatting, removes the carbonic acid and pure nitrogen gas remains. This gas can be used as above stated, and the spongy iron, after it ceases to act on the carbonic oxide is then in a fit state to be converted into Prussian blue.

DEFERRED NOTES.

Before the Christmas holidays we had occasion to make a trip westward as far as Windsor, and being so near that great and beautiful frontier city—

DETROIT,

we crossed to see how our cousins were getting along. Business was lively in almost every branch,—manufacturing, building, buying and selling. Uncle Sam was gay and happy. Immense quantities of provisions and lumbermen's supplies were being sent north. The train for Bay City was loaded with shanty-men. The local prices of lumber had not changed much from former quotations, but were firm. Recrossing to

WINDSOR,

the people there, too, were full of business. The ferry boats are doing a large business, transporting teams loaded with cordwood and other produce from Canada for the Detroit market. A few manufacturing firms from Detroit, as will be seen by reference to our advertising columns, have established branches of their business in Windsor. This is to save the import duty, which with the improved and increased manufacturing facilities in the Dominion enables our manufacturers to compete on equal terms with those in the United States. About a mile up the river is

WALKERVILLE,

founded, and in a great measure sustained by H. Walker, Esq., the extensive distiller there. His establishment is only second in Ontario, to that of Messrs. Gooderham & Worts, of Toronto. Every department of the distillery is in the best of order and condition. The machinery for grinding, mashing, pumping, &c., and a magnificent engine of 200 horse-power with a fly wheel weighing nearly eleven tons—crank shaft 12 inches in diameter, a 20 inch cylinder of 42 inches stroke were manufactured and put in by the Kerr Brothers of Walkerville, who have a foundry near by. The water works of the distillery, worked by a 100 h. p. engine, has three large pumps, said to be capable of drawing from the river 900 gallons of water per minute. The establishment has eight run of millstones in operation, and pays about $350,000 per annum duty into the Dominion treasury. There is considerable traffic in this neighbourhood in stave timber, and some oak is brought in.

CHATHAM

was our next stopping place. This town has grown rapidly within the past few years. The large lumber yards are well stocked with lumber and shingles. The largest is kept by Messrs. H. A. Patterson, & Co., who also manufacture sash, doors, &c. There are several manufacturers of engines, boilers, brass castings, &c. Mr. D. Park has invented a machine for making barrels, including the heading. We expect to be able to explain this machine more thoroughly with the aid of a cut or drawings, shortly. Mr. R. Parkinson's establishment, the Reliance Engine Works, is also worthy of notice. Chatham can boast of some excellent flouring mills, which supply "the staff of life" to the population, whether white or coloured.

Again aboard the comfortable but somewhat crowded cars of the G. W. Railway, and

THE CITY OF LONDON

is soon reached. Here again all is bustle and activity. Building to a considerable extent is going on. The lumber yards are tolerably well stocked. Prices are keeping well up. A visit to the lumber dealers and some of the manufacturers filled up all the time at our disposal. The people seemed contented and prosperous. We met Mr McRae, of Glencoe, who is getting out a large quantity of oak timber this season. He reports the season's work well advanced. A short run on the branch line brings us to

ST. THOMAS,

a thriving town, the proposed terminus of the Credit Valley Railway. The town is growing rapidly, and will continue to increase in importance. It has a large number of planing mills and manufacturing establishments. The Dexter Manufacturing Co. of bent carriage and sleigh work are enlarging their premises; C. Norsworthy & Co. have constructed a tramway engine, to draw logs and timber on pole roads. It is to work in Essex Centre, where 14 miles of track has been laid. We have no doubt the flange driving wheels carrying the locomotive will work well. They are constructed to slide on small steel rollers along the axle to accommodate irregularities in the width of the track, but at the same time are stationary on the axle as far as revolving with it is concerned. The stock of lumber on hand in St. Thamas is large, but as the demand is good both in town and country, it will be all required before next year's stock comes in. The farmers in the neighborhood generally are wealthy. We had a pleasant visit with one of them, whom we had not seen since we crossed the Atlantic with him from Aberdeen, over 34 years ago. Resuming our journey by way of Harrisburg, we stop at

THE CITY OF BRANTFORD,

when limited time only enabled us to visit the works of the enterprising firm of Waterous & Co., whose steam engines, saw mills and other numerous and excellent manufactures are known all over the Dominion. Next we call at

DUNDAS,

which presents a beautiful view from the railway station. With the exception of the cotton factory, Messrs. McKechnie & Bertram's establishment, which turns out all sorts of machinery, and has just been enlarged; an axe factory and planing mill, there does not seem to be much going on in that town. Its proximity to

THE CITY OF HAMILTON

has perhaps something to do with this. Business is good in Hamilton. Manufacturers say they have orders on hand to keep them employed until spring. Building has been continued during the winter. Merchants are in good spirits. Workmen have plenty of work, and some new manufacturing industries are about to be established.

A run by the Northern Railway brings us to

GRAVENHURST.

This is a lively village and prosperous. Its prosperity is chiefly owing to the number of saw and shingle mills in the vicinity, and to its being the terminus of the Northern and Northwestern Railway, where, during the winter season, all freight for the northern region is reloaded, and drawn by teams. The summer trade is mostly carried past, by the steamers, to Bracebridge and Rosseau. Several lumbering establishments have branch offices here. Some idea of the quantity of supplies required may be formed from the following list of lumber to be got out this winter in the Muskoka and Parry Sound Districts:—

	Logs.	Square.	Shingles.
Georgian Bay Co.....	70,000,000		
British Canadian Lumber & Timber Co....	26,000,000		
T. Smith & Son	15,000,000		
Rich Power.	12,000,000		
Muskoka Mill and Lumber Co.....	12 000 000		
J. C. Miller..	15,000,000		
Ontario Bank late Guelph Co.....	9 000 000		
J. Thompson	12,000,000		
Dom. Bank, late Silleman.....	6,000,000		
Toronto Lumber Co.....	7,000 000		
Wm. Tait....	5,000,000		
T. Meikle....	4 000,000		
J. M. Dollar...	4,000,000	200,000	
Messrs. Cockburn	4,000,000		
Woodstock Lumber Co.	5,000,000		
G. W. Taylor	11,000 000		
Wm. Beatty..	3 000 000		
S. S. Cook...	1,000,000	200,000	
Barton Bros...		60,000	
F. H. Hull.	2 000,000		
Abel Marshall	1,000,000		3,000,000
Boyd Caldwell.....	3,000,000	100,000	
O. F. Wright oak & pine		100,000	
G. Chase & Co	1,500,000		
Thompson & Baker			5,000,000
Heath & Tait			1,500,000
W. Strathearn.....			2,000,000
R. Robinson			2,000,000
P. Bartholomew.....			4,000,00
Other manufacturers..	10,000.000		10,000,000
	238,500,000	660,000	32,500.00

Messrs. Thompson, Smith & Son are also getting out 25 million feet at their Duncan City mills, Mich. Last season they cut 15 million feet at their Bradford mills; 2 million at the Barrie mills, and 22 million at Duncan City mills. Their stock on hand is Bradford mills, 6 million; at Duncan City mill, 10 million; Barrie, all shipped. They employ about 600 men and 150 teams. The Muskoka Mill & Lumber Co., last season cut 15 million and have on hand 4,500,000 in lumber and 6,000,000 in logs.

BRACEBRIDGE.

This is the winter head quarters of the British Canadian Lumber & Timber Co.,

formerly H. H. Cook & Co. Mr. Robt. Dollar is in charge, and has every thing in good working order. We learned that the work is well advanced in the 9 camps they are running. The early sleighing and steady cold weather have favoured the work in the whole district. In some of the camps chopping is completed and the logs will be hauled before the first of February. Mr. Dollar has ice sprinklers in operation for hardening the roads.

PARRY SOUND.

This important village seems rather dull in winter, but it will have a large share of the advantages of the lumber trade when spring opens. Mr. Miller is constructing a new iron furnace to consume saw dust, slabs, &c. The other mills are refitting. Mr. W. Beatty intends to increase the capacity of his mill; last year he cut 3 million. The leading men of Parry Sound are anxious to have

A BRANCH RAILWAY

to connect with the Ontario & Pacific Junction. This would place their fine harbour in direct communication with the North West, and would place them within an easy distance of Ottawa should they wish to go there in preference to Toronto.

M'KELLAR'S FALLS.

The Messrs. Armstrong are doing a large business here, in this lumbering centre. They have large contracts getting out logs, keeping about 150 men at work, and report the season very favourable for every branch of saw-logging.

Other "deferred notes" must be left over to another issue.

Toronto and Nippising Railway.

This convenient line of railway has been doing a good business during the past year. The lumber carried over the line is as follows :—

Jany. 574,000 feet. Feb. 286,000. Mar. 602,000. April. 588,000. May 477,500. June 505,000. July 658,000. Aug. 766,500. Sep. 890,000. Oct. 673,500. Nov. 530,000. Dec. 305,000. Total 6,856,000.

The shipments were from Coboconck, Victoria Road, Kirkfield, Uxbridge, Goodwood, Stouffville, Ballantrae, Vivian and Sutton. Should the new mills, contemplated be put up in connection with Gull River, a large trade will be done from Coboconck this year.

LUMBER DRIVING.—In New Brunswick, lumber merchants are alive to the importance of organization in boom accommodation and river-driving. A company similar to the Muskoka Boom and Slide Company is about to be formed to conduct operations on the Miramichi River. The Miramichi *Advance* referring to the subject says :—"If logs are beyond certain points up-river the complications which may arise in driving, seriously affect market values, for the time when delivery can be made, through the booms at the mills, is a very important consideration. Up to the present time it has been in the power of any operator—large or small—to impede the progress of logs to market by not attending promptly to his own drive when it became mixed with those of others. Only last season, 20,000,000 feet of logs were kept out of the market for months in this way and as the business becomes more divided up or new operators come in the danger of interference with the regular log-supplies coming down to the mills will increase. The main river being the common highway which all operators must use, it is obvious that the common interest can best be served by one corporation. A company can drive all the lumber more cheaply and expeditiously than any temporary combination of drivers. No one will be in a position to hold back, in order that he may delay another, while a great deal of anxiety and watchfulness on the part of the owners will be obviated. Let us, then, have the Lumber Driving Company, by all means.

Shipments from St. John.

A late St. John's *Globe* says, the shipments of deals from St. John to Europe and Australia during the year just ended were very large, exceeding by a large amount the shipments in the two past years, and not being far behind the shipments in 1877. For the sake of comparison we give the last five years :

	Superficial feet.
1876	192,975 772
1877	215,173,920
1878	197,002,364
1879	152,349 000
1880	210,012,009

The improvement in the English wood market early in the year gave an immense impetus to the shipment of deals the past season, and, as is seen above, nearly sixty million more feet were sent forward than in the previous year with the result that the market was overstocked, and prices, in consequence, fell.

The stock of deals on hand now is comparatively small,—being in the vicinity of twenty million feet, and as there is no immediate demand the shipments for some time will be very light. A very busy season is expected next year, however. Lumbering operations are being carried on on an unprecedentedly large scale all over the Province, and should the present depression in the home market prove to be only temporary the year 1881 should prove a memorable one in the deal trade

LEATHER MANUFACTURES.—The Amherst *Gazette* says :—The manufacture of various kinds of leathers and their products form an important part of the business of our town. Mr. Casey now employs fourteen hands in his tannery, and the leather on hand, in various stages of manufacture, represents a large value. He has 1,000 sheep-skins, which he is commencing to make into coloured roans. His sales of leather to one concern in the last three months amounted to $3,300. Mr. R. Lusby also has 1,000 sheep-skins for his coloured roan factory. The Amherst Boot and Shoe Company has its usual number of hands, and is rapidly converting the leather into boots and shoes. Mr. J. J. Leonard has begun an industry which is new in the Maritime Provinces—the manufacture of kid mitts. They are made of finely finished stock, prepared by himself, and the stitching is neatly done by Miss Sibley. They compare favourably with goods of the kind made elsewhere, in all respects, and we hope buyers will give them the preference to imported ones. Mr. L. is turning out 78 pair a week. The harness shops of Messrs. Read, Fraser, and Sharp also use considerable quantities of harness leather. Among the establishments in the county, outside of Amherst, devoted to the leather business, the principal one is the steam tannery of Messrs, Upham & McCale, Parrsboro, which has lately opened with facilities for a large business.

WOOLEN MANUFACTURES.—The value of the annual product of the woolen mills in the Dominion of Canada is estimated at $7,000,000. The *Monetary Times* has received estimates from 79 mills whose products amount to $4,250,000. The other mills on this Ontario list will turn out perhaps $700,000 worth of goods. The Quebec mills named turn out annually close upon $200,000 worth. This is exclusive of custom mills and small factories, many of which turn out coarse cloths. The Almonte *Gazette* in reviewing the list of Ontario mills, says :—The total product of Almonte in this line, is $530,000 per year. Sherbrooke stands at the head, with a product of $640,000 a year, Almonte being the next highest. The position to which our town has attained as second in the Dominion in this important branch of industry, is one of which we should all be proud. When the new worsted factory and Sheard & Thoburn's flannel factory are in operation—and that will be in a month or two—we will be ready to change positions with Sherbrooke, and take the same place for quantity that we now hold for the quality of our woolen products.

A NEW ARTICLE OF EXPORT.—Several car loads of sawdust have been shipped lately over the St. John and Maine Railway. It seems that some one in Boston is building a very large refrigerator and he finds it to his advantage to bring the sawdust from New Brunswick.

IMPORTANT STATISTICS.—The following is a statement of exports from Canada into Chicago by lake during the seasons o 1879 and 1880 :

	1879.	1880.
Lumber	494,000	755 000
Ties	none	409 588
Posts	21,375	76,234
Telegraph poles	3,174	15,458
Tan bark	921	3,865
Wood	none	495

Statement of exports from Collingwood to Chicago by lake during the season of 1880 :

	1880.
Lumber	none
Ties	103,663
Posts	27,533
Telegraph poles	1,204
Tan bark	934
Wood	none

By a comparison of the above figures it will be seen that Collingwood shipped to Chicago during the season of 1880, one-quarter of all the ties; over one-third of all the posts, one-thirteenth of all the telegraph poles, and nearly one-quarter of all the tan bark received at that port by lake during the season.

SHIPPING AT ST. JOHN.—The St. John *Globe* gives the following statement of shipping on the registry books, St. John, at the close of each year during the last quarter of a century :—

Year.	No. of Vessels.	Tons.
1856	585	135,713
1857	543	138.669
1858	497	114.457
1859	489	112.420
1860	492	123.425
1861	486	137,873
1862	475	135 247
1863	521	174,135
1864	570	185,700
1865	628	203,783
1866	612	195.199
1867	640	186 300
1868	682	196 018
1869	703	203.660
1870	734	214.814
1871	767	226,727
1872	814	246 485
1873	806	247.228
1874	808	263 410
1875	802	263 204
1876	805	280 073
1877	776	279 636
1878	753	276 272
1879	738	281.101
1880	700	275,879

SITUATION WANTED.

SCOTCHMAN, CAPABLE OF RUNNING A SAW Mill any capacity, 18 years experience; best of references. Address, Editor LUMBERMAN.

AUCTION SALE

—OF—

Saw Mill, Wood and Iron Working Machinery.

JOHN McFARLANE & CO. HAVE RECEIVED instructions from Wm Dingman & Co to sell at their Warerooms, 55 Front St. East,

On Tuesday, the 18th of January,

the whole of their stock, consisting of Stearn's No. 3 Circular Mill, Log Canter, 68 h.p. Engine, Planers, Drills, saws, &c., &c. Catalogue on application.

HAYTER STREET

Wood Turning & Sawing Factory

33 Hayter Street, Toronto.

JAS. F. HAINES,

WOOD TURNING,

BAND & SCROLL SAWING,

SHAPING, &c., &c.

Piano and Organ Fret Sawing

a specialty.

All orders executed on the shortest notice.

Central Prison Industries.

Offers will be received by the undersigned up to noon of

Thursday, the 20th January, instant,

FOR

1500 Cords of Pure Hemlock

—AND—

MIXED SOFT WOOD,

in equal quantities, (500 cords to be cut) to be delivered in the CENTRAL PRISON BRICKYARD, TORONTO, on or before the 15th of May next.

J. W. LANGMUIR,
Inspector

Office of
Inspector of Prisons & Public Charities,
Parliament Buildings, Toronto.

MUSKOKA

Slide, Dam & Boom Company

Tenders for the following works on the Muskoka waters will be received until 1st. of February next:

1. Slide Dam at Mossom Lake
2. Piers, Booms at Cattaraqui Rapids
3. Piers and Booms at Lake
4. Piers, Booms and Cribs at Bala
5. Slide and Piers at Gravenhurst
6. Piers, Booms and Cribs at Muskoka River
7. Slide at Hall's Falls
8. Slide at Gray's Chute
9. Booms and Piers at Mary Lake
10. Booms at High Falls
11. Piers, Booms, and Cribs at Muskoka Lake
12. 400 pieces of Timber at Gravenhurst, Muskoka Lake.

Works to be completed before the opening of navigation, 1881. Tenderers must give security. The lowest or any tender not necessarily accepted.

Plans and specifications can be seen after 15th. of January at the office of

R. DOLLAR, Manager.
BRACEBRIDGE

CHAS. M. LARSEN

Manufacturer of all kinds of Lacquered and Enamelled Woodware, Turning and Carving in

WOOD, HORN, AND IVORY.

BILLIARD BALLS

Turned and coloured a specialty.

Meerschaum and Amber Goods repaired in first class style.

77½ King St. West, Toronto, Ont.

GLASS BALL CASTORS

For FURNITURE, PIANOS, ORGANS, etc., the best and most ornamental Castors in the market. They greatly improve the tone of musical instruments

RHEUMATISM, NERVOUSNESS, SLEEPLESSNESS cured by insulating beds with them.

Sold by hardware dealers. Agents wanted.

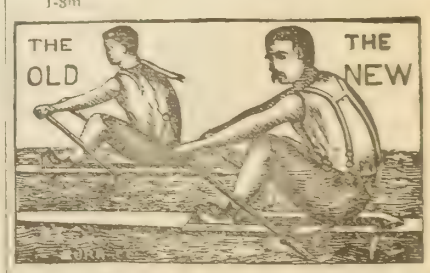
ADDRESS FOR CIRCULARS :

Glass Ball Castor Company,

64, 66 & 68 REBECCA ST.,

HAMILTON, ONT.

1-3m



The UNIVERSAL SUSPENDER.

SOME REASONS why they are the best:—

1st.—No Elastic requied.
2nd.—Is slack when stooping.
3rd.—It never slips off the shoulders.
4th.—Sold at prices of common suspenders.

Manufactured by C. E. RAMAGE & CO.

90 BAY STREET, TORONTO.

Learning to Skate.

It is a mistaken idea that skating is similar to dancing, and as readily acquired. The surface of the ice is dissimilar to that of a waxed dancing floor, and the inch or two height of the skate—the difference between the runner of the skate and the sole of the shoe in bearing surface; the fine balance of the body required to preserve the equilibrium; the knowledge of the right swing and place of the unbearing leg; the position of the head and shoulders, and the direction of the eyes—all relating to the centre of gravity and governing the direction of the skater, are matters to be studied. Knowledge to be acquired, and to be carefully observed in all movements in skating, which is mathmetical to a vast extent upon the ice skate, and perfectly so upon the Plimpton roller skates, which cannot be forced out of a true curve or straight line, while the ice skate can. Therefore it becomes every one who anticipates the acquirement of the art of skating to enter upon it not only as a pastime, but with the certain knowledge that the acquirements of the various movements demand close study and application. "Practice makes perfect," particularly in skating.

We do not wish to discourage those who would learn to skate. On the contrary, a knowledge of the obstacles to be surmounted communicated at the outset will prevent discouragement later on.

Remembering that the possessions that most endeavour are most dearly appreciated, you will realize that the skating movements that demand the most labor are prized most highly when acquired. Go at skating with an inquiring turn of mind. Ask why the unemployed leg should be behind in executing the outside edge roll forward and why in front in the inside edge backward, and the many other curious questions arising in the mind of the learner, and solve the riddles, or ask others to do so, until the law is explained, and the proper position will be involuntary.

Whatever you do, do it well, and learn but one movemsnt at a time, taking the simplest first. This would seem to be foolish advice, but look into it. There are skaters who cannot skate the inside edge roll forward or backward who pretend to do the Bishop 8, Mercury, flying scud, grape vines, one foot 8 and loops, in each of which the inside edge must be introduced to render the movement complete. There are many who have educated the right foot to the execution of certain movements, and kept the left in ignorance. These are not good skaters. Make your skating perfect by commencing on the first round of the ladder, get firm hold of that before starting for the next, so that when the top is reached you can retrace your steps when necessary. The simplest movement, the plain forward, as well as the edges, enter into every complicated combination. You might as well attempt to read without the knowledge of the alphabet, as to skate any movement without proficiency in the rudiments. Therefore perfect yourself in the plain forward, then both the inside and outside edges forward and backward, then the threes and you have the elements of all the movements that can be formed upon skates. In respect to

PRACTICE.

we would recommend its commencement in the house, in order that you may accustom yourself to the "feel" of the skate and get some idea of "balance."

"Having properly adjusted your skates stand with your heels together and feet at right angles to each other, body erect, leaning slightly forward, arms hanging loosely at the side, eyes gazing at some object twenty feet or more in advance, legs touching each other, shoulders thrown back and breast expanded full forward.

Never look down at your skates, or you will throw yourself out of position and balance. Study this rule and accustom yourself to observe it.

2. In skating, the propelling power generally comes from the un-bearing leg or the leg which does not bear upon the ice; therefore place the heel of the right into the hollow of the left foot, take one short step forward upon the right, at the same time swinging the body well forward upon the right foot, making that foot bear the weight of the body.

3. Bring the heel of the left to the hollow of the right; advance one step with the left foot, throwing the body forward upon the left.

These movements constitute "plain forward" skating. Practise thoroughly until it can be done with ease, and without liability of the body swinging to either side so as to lose the perfect balance. If your left is weaker or more disinclined to work than your right foot, use it until it is taught to perform its work and become as perfect as the right.

After practising this movement until you have reached a run, keeping the body well over the skate, the toes well turned out, and not allowing the off foot to touch the floor, take the next movement.

4. Place the heel of the left opposite the hollow of the right with the weight of the body upon the left. Raise the right carefully and carry it over the left to the opposite side, throwing the weight of the body upon the right foot. Raise the left and carry it to the first position. Repeat this, moving in a circle, going from right to left. Reverse the direction by placing the left over the right and walking in a circle.

This movement is called the "lap-foot" forward, and is a material aid to the movement which follows. Practise it thoroughly before attempting the next, and don't be afraid to lift your feet well up and bend the knees as in a walk around.

5. Stand with your toes turned in and your feet at a right angle to each other. Raise the left foot about five inches from the floor, slightly bending the knee, carrying the left well over and in front of the right, and placing it upon the floor in this position throw the weight of the body upon the left foot. Raise the right and carry it well over and in front of the left. Continue this movement until perfect and you will have accomplished the "cross-roll" forward.

This movement needs thorough practice to accustom the ankle to the turning in of the foot.

6. A backward movement, necessitating a different position of the body. Stand with the shoulders thrown backward, the body leaning slightly backward. Be very careful to observe the position, and if you desire to spoil the movement and lose your balance, lean forward. Place the heel of the left opposite the hollow of the right, the weight of the body upon the right. Raise the left and carry it behind and well across the right, letting the weight of the body come upon the left foot. Raise the right and carry it to first position. This will take you to the left, continuing which will form a circle. Perform the movement in the opposite direction by placing the right behind the left, instead of the left behind the right. Above all, lean backward, because it will preserve your equilibrium and is the proper position of the body. This movement is the "lap-foot" backward and needs much practice.

7. Heels together, feet at right angles and weight of the body upon the right foot. Carry the left back of and well over to the opposite side of the right, throwing the weight of the body upon the left. Raise the right foot and carry it around, back of, well over and to the opposite side of the left. Lean backward and practise this thoroughly until it is as easy as walking, and you will have accomplished the "cross roll" backward, one of the most beautiful movements upon skates, when properly executed.

Other movements can be practised in the same way in the house, but if the learner will perfect himself in these, he will find the practice of the utmost value to him, and the performance of the movements on ice a simple matter. Let body and limbs be elastic, knees readily bent, ankle loose, arms at the side, hands not clutching at vacancy, but open with the palms facing the body, knee of the performing leg always slightly bent, every movement lightly and gracefully executed, without apparent effort; and above all, *never look down at your skates.*

A FOUR-YEAR-OLD child, saying her prayers at her mother's knee, having concluded as usual, with "God bless papa and mamma, grandpapas and grandmammas, uncles and aunts," etc,, gave a great sigh, and said: "O mammy dear, I do wish these people would pray for themselves, for I am so tired of praying for them."

THE 3-year-olds belonging to Lord Falmouth did so badly in all the great races of the season that one is hardly prepared to find him standing for the fifth or sixth time in the last ten years at the head of the winning owners in England. But thanks, in the main to the eight victories of his 2-year-old filly, Bal Gal, who has won more money than any animal of her age ever did before, the occupies this position with a total of £16,-061 won in twenty-one races. Of this total Bal Gal has secured more than half.

Further from Mauna Loa.

CONTINUANCE OF THE GREAT VOLCANIC ERUPTION IN HAWAII.

The Chinese merchant steamer Ho Chang, which arrived at San Francisco on the 16th ult., brought the Hanolulu (Hawaii) *Gazette* containing further details of the great eruption of Mauna Loa and other volcanoes near by. Clouds of dense smoke had hidden the mountain the greater part of the time, but those who had visited the scene described it as grand and awful beyond the power of words to express. The eruption has now continued for about six weeks, and the lava stream had reached the woods near Hilo. From Kilena it is reported that the stream has changed its direction, and the Kapela sugar plantations, for a long time regarded as in danger, are now considered safe. Reports are up to the 6th of December, and show the most active flow now is that running from near the summit of Mauna Loa in a northerly direction towards Mauna Loa. Clouds of smoke envelop the mountain, but at times they lift, showing the red river of lava moving down the mountain. On Nov. 20, which was a very clear day, the eruptions were plainly seen from their craters. Those watching the mountain from Hilo on that day about dusk saw a sudden explosion from one of these craters. A vast column of material was suddenly thrown several hundred feet in the air; several days after, another clear day showed that the summit of the mountain has undergone much change. Three craters, each separated by about a mile, were seen, and each seemed intensely active. A correspondent who went up on the mountain near the base of the flow says: "The lava has flowed about 25 miles towards Hilo, and is now in the neighbourhood of 20 miles away. It is from a quarter to half a mile on the upper part of its course, and lower from three-quarters to a mile wide. It has entered the woods on one side, and as it rises high above '55 flow,' which is specially high at this point, its motion looks threatening enough. I did not see any portion of it in motion at the lower end, but concluded that the motion was at the centre and of a rotary nature, rolling masses of clingstone to either side and forming great piles as it rushed along. I saw no trees burning, though the stream had advanced into the upper road. My theory is that the head of the stream is not molten, the liquid lava being underneath, and that progress is made now, although not open, running down the mountain, thereby throwing congealed and congealing masses ahead like puppet balls, pressing down trees and immediately burying them as the river of stones moves on. While all this is going on old Kilau Mountain maintains its ancient reputation, and its three lakes are in most intense activity, each vieing to surpass in brilliancy and beauty former displays. Streams frequently flow from them, but with no regularity." Parties are visiting the new eruption every day, and from this side can approach the stream and ride along almost its entire length of 18 or 20 miles within a few feet of it. The combined length of the two streams, the northern and the eastern, cannot be less than 40 miles. One party has even ventured to sleep on a spur of the new stream; enjoying its warmth and a good nap.

Inaction.

Great evils result from physicial inaction. It is well known that through the whole human system, strength and development come only by exercise. Every unused muscle shrinks in size and loses its force, and the man or woman who lives chiefly a life of passive repose will gradually lose the power as well as the desire for activity. This, however, is by no means the whole of the evil involved. The connection between the mind and the body is very intimate, and the mental faculties cannot obtain their full power, nor the character attain it highest excellence, unless the body be kept in healthful condition by salutary exercise. Pure air and regular physical exertion are necessary in order to think clearly, to decide wisely, to reason acutely, to plan with discretion, and to execute with vigour. Strength of will depends largely upon strength of muscle, and he who is weak and flabby in the latter will in all probability be feeble and irresolute in the former.

THE Duchess of Westminister died of Friday evening at her residence at Bournemouth.

Cold-Footed Woman.

Says Dr. J. H. Handford in the "Laws of Life:" "The question is sometimes asked 'Who ever knew a woman to have warm feet?'" The Dr. thinks this is a somewhat extreme view of the matter, but still he decidedly takes the ground that women, as a class, are victims of cold extremeties. With the gallantry that impels every true man to defend womankind, I at once thought when I read the Dr.'s opinion that it must be explained on the principle that cold hands and a warm heart go together. Probably the feet obey the same law of contrariety. But alas! this pleasant theory is run out. The Dr. ascribes the cold feet of womankind to the foolish habit of wearing thin and tight boots. For this folly man is chiefly responsible. Almost universally, human beings of the male persuasion adore small feet in women. It is an absurd thing to do, but mankind are absurd in many respects. I never could see the special charm of a small foot, but I never was, technically speaking, "a lady's man." A pretty face never inspired me with rapture, unless there were intellectual and moral qualites to match. If a woman has a good mind and a good heart; she may wear a No. 10 boot for all that I care. I would look at the eyes beaming with intelligence and goodness, and never think of her big feet. But it is different with the majority of men. And woman, with that readiness to sacrifice herself to please the other sex, which is characteristic of her, will endure untold tortures to secure the winning charm of "dear little feet." Dr. Handford very ungallantly says: "The false idea of the necessity of a small hand and foot may depend on the corresponding smallness of the brain." I would rather ascribe it to the largeness and softness of the heart. But, be that as it may, the prevailing custom results in cramped, crippled, deformed, cold feet, and the sooner it is abandoned the better it will be for female health and comfort.

The Irish Secretary.

The face of Foster, the Irish secretary, is not, says *Pan*, an exact index of his mind. He looks unbending, even morose. It is as if he put on the grimace of what he would wish to appear. There is an air of faded ruggedness about his large and irregular features. His bridgeless nose is thick and round in the region of the nostrils, his cheeks are wide and full, his anxious eyes are deep-set beneath a massive forward brow seamed with thought and half covered with pale patches of hair, combed down carelessly from right to left. He wears a ragged red and gray beard and a mustache—which gives the chief point of character to his face—cut close to the top of the upper lip, straight across from corner to corner of a wide mouth. Tall and somewhat fleshy, with large feet and hands, and long legs that are loose from knee to ankle, he walks with quick, uncertain strides, and sits with his body forward, toward the edge of the seat, his chin on his breast, his eyes cast down, and his hands clasped across the region below the bottom of his waistcoat.

For a man 62 years of age, Mr. Foster displays extraordinary physical vigor. In the execution of his office he seems indifferent to fatigue and impervious to its effects—unless, indeed, an occasional nap on the treasury bench can be counted against him. His manner of answering questions is short, to the point, and in extreme cases, somewhat imperious. His ordinary voice, however, falls pleasantly upon the ear; it is that of a scholar and a gentleman; and when roused to an effort of oratory, few men in the house are more impressive than the rough but accomplished Yorkshireman and worsted manufacturer. Five years ago he was at the zenith of his fame, and might have been prime minister of England but for his inveterate habit of shilly-shallying. He could not make up his mind that the party would follow him.

LORD BEACONSFIELD sent a presentation copy of "Endymion" to the Queen, to which she devoted immediately her first mornings after her return from the Scottish Highlands. The only other ladies who received this distinction were Lady Chesterfield, who is a special friend of Lord Beaconsfield, and whose late husband was an associate of his in his youth, and Lady Bradford, who is her sister. Lord Beaconsfield visits their country seats every season.

THE wife and sons of the Russian grand duke Nicholas are guests of King George at Athens.

Muskoka District.

LUMBERMEN'S SUPPLIES.

To meet the demands of the LUMBERMEN IN THIS DISTRICT I have opened out a

WHOLESALE SUPPLY DEPOT

At BRACEBRIDGE, where everything in the shape of Lumbermen's supplies or Furnishings, can be obtained in large or small quantities, at wholesale rates.

Outside quotations or correspondence solicited.

F. W. JEFFERY.

Guaranteed to grind any kind of grain, fine or coarse, equally as well, as a four foot mill stone.
WATEROUS ENGINE WORKS CO., BRANTFORD, CANADA.

MILLSTONE CHOPPING MILLS FOR LUMBERMEN.

Wil grind as fine as any four-foot stone.

Lumbermen, grind your own Horse Feed.

Make your own Flour with our Portable Grist Mill.

PRICE, Grist Mill complete, $600. Capacity, One and a half barrels of good flour per hour.

Send for particulars, address

Orders sent to M. Brennen, Tiago, P. O., will receive prompt attention.

THE GENUINE

Silver-Steel, Lance-Tooth Cross-Cut Saw!

It stands without a rival. and is the fastest cutting saw in the world. It has beaten the best Canadian and American-made saws 33½ per cent. in every contest. Its superiority consists of its excellent temper. It is tempered under the Secret Chemical Process, which toughens and refines the steel. It gives a finer and keener cutting edge, and will hold it twice as long as any other process. We have the sole right for this process for the Dominion of Canada.

None genuine that are not like the above cut, with registered trade mark with the word "The Lance," and Maple Leaf with our name. Price $1 per foot.

CAUTION. — Beware of Counterfeits. There are inferior counterfeits on the market, which are intended to be sold at a high price upon the reputation of this saw. We will send to any address a saw exactly like any counterfeit, warranted equal in quality or no sale, at 60c. per foot. Therefore do not be humbugged into paying a first-class price for a second-class saw. A fact to bear in mind is that if the material and temper are not of the very best quality the shape of the teeth amounts to nothing. A saw, like a knife, will not cut fast without it will hold a keen, cutting edge. We have cut off a 14-inch sound basswood log in eight seconds with this saw.

Manufactured only by

SHURLY & DIETRICH,

Manufacturers of Saws, Plastering Trowels, Straw Knives, &c., &c.

GALT, ONTARIO.

Parties *en route* to the Muskoka District, will find "Fraser's" a comfortable stoppi place. The Bar and Larder are well furnished. Convenient Sample Rooms for Commercial Men. Good Stabling and attentive hostler. Free 'bus to and from trains and steamboats.

HOTEL OTTAWA,

No. 21 North Side King Square.

ST. JOHN, N. B.

E. COSMAN, - - Proprietor.

Terms, $1.00 to $1.50 per day.

THE RUSSELL HOUSE,

OTTAWA,

JAS. A. GOUIN, - - Proprietor.

IS THE

Favourite Resort of the Leading Public men of the Dominion attending the annual Sessions of Parliament.

Ministers of the Crown, Senators, Members of Parliament, Public Officials, as well as those having business with the various Departments of the Government. It is also the head-quarters of those having dealings with the princely Lumber Manufacturers in the great Pine Valley, of which Ottawa is the acknowledged centre.

THE RUSSELL HOUSE being central, almost abutting on the magnificent PARLIAMENT and DEPARTMENTAL BUILDINGS—the pride of the Country—is thus conveniently situated for those visiting the City on public business. But the location is also everything that could be desired alike for the man of business and the man of pleasure. A few minutes walk brings the guest of the Hotel within reach, not only of all the principal business resorts, but also of the most splendid Mountain and Valley Scenery that can be seen anywhere, as also of the two almost unrivalled Waterfalls—the Chaudiere and Rideau—and of the extensive Manufacturing Establishments and Depots of the leading Lumbermen. But, besides the beautiful scenery, which, it may be mentioned, includes the magnificent Ottawa and two of its grand tributaries—the Rideau and the Gatineau—there are in the immediate neighborhood, beautiful Lakes and apparently never-ending woods, which afford opportunities for the finest Fishing and Shooting that can be obtained on the Continent.

THE RUSSELL HOUSE affords excellent accomodation for 300 guests; its table is abundantly supplied with Viands of the choicest description, in season, and nothing is left undone to make every visitor feel comfortably "at home."

☞Omnibusses meet the Arrival of every Train and Boat.

MARKET REPORTS.

CANADA LUMBERMAN OFFICE,
TORONTO, 13th Jany. 1881.

Business has been steady during the past week. Orders from western villages and towns, however, are coming in freely, and stocks are keeping up from northern and eastern arrivals. Building continues fairly brisk, no complaints of workmen remaining idle for want of work. Dry lumber is getting somewhat scarce. There will be very little on hand by April. Reports from all quarters relating to logging and getting out square timber are most favourable. Good sleigh ing all over the country from Sarnia to Cape Breton.

READ THIS!

CHATHAM, Dec 2, 1880.
F. CRUMPTON.
Dear Sir,—The watch which I selected from your Catalogue was received yesterday, and I must say that I was greatly pleased with it ; in fact, if I had *personally* selected it, I could not have suited my taste better. It is just what I wanted. If I want anything in future, I shall know where to procure it at a reasonable figure.
Yours very truly,
J ——

MACHINERY OILS!

To Dealers and Consumers.

STOCK OLEVINE, Equals Castor Oil, and Warranted not to Gum.

STOCK OLEVINE Equals Castor Oil, and Warranted not to Gum.

It will give the subscriber much pleasure to forward, post free, to any address, on application, a pamphlet, containing instructions and information that have been found of the greatest practical use to dealers and consumers of machinery oil in Canada. It contains the fullest information as to the different kinds of oils, their qualities and uses, thus enabling the consumer to make choice of the very oil best adapted to his wants, and also enables the merchant to select the kinds most likely to be in demand in his neighborhood. This pamphlet shows conclusively that oils properly manufactured from petroleum, are vastly superior to any *animal* or *vegetable* oil. I am now making the same qualities of "Extra" and "XX" oils I manufactured from 1870 to 1878. They are *guaranteed not to thicken with extreme cold*, and warranted to give satisfaction in every particular. Beware of Agents soliciting your orders without my trade-marked order-book. Address

VOL. 1. PETERBOROUGH, ONT., MARCH 15, 1881. NO. 10.

THE RIVER, STREAM AND CREEK ACT.

Whatever view the reader may take of the bill now before the Ontario Legislature for the purpose of "Protecting the Public Interest in Rivers, Streams and Creeks," everyone will concede that it affects interests of vital importance to those engaged in lumbering operations and deserves the fullest consideration and discussion at their hands. The following are the provisions of the bill as introduced by the Commissioner of Crown Lands,—the Hon. Mr. Pardee :—

1. So far as the Legislature of Ontario has authority so to enact, all persons shall, subject to the provisions in this Act contained, have, and are hereby declared always to have had, during the spring, summer and autumn freshets, the right to, and may float and transmit saw-logs and all other timber of every kind, and all rafts and crafts, down all rivers, creeks and streams in respect of which the Legislature of Ontario has authority to give this power ; and in case it may be necessary to remove any obstruction from such river, creek or stream, or construct any apron, dam, slide, gate-lock, boom, or other work therein or thereon, necessary to facilitate the floating and transmitting such saw-logs and other timber, rafts or crafts, down the same, then it shall be lawful for the person requiring so to float and transmit such saw-logs and other timber, rafts and crafts, and it is hereby declared always to have been lawful, to remove such obstructions, and to construct such apron, dam, slide, gate-lock, boom, or other work necessary for the purposes aforesaid, doing no unnecessary damage to the said river, creek or stream, or to the banks thereof.

2. In case any person shall construct in or upon such river, creek or stream, any apron, dam, slide, gate-lock, boom or other work, necessary to facilitate the floating or transmission of saw-logs or other timber, rafts or crafts, down any such river, creek or stream, which was not navigable or floatable before such improvements were made, or shall blast rocks, or remove shoals or other impediments, or otherwise improve the floatability of such river, creek, or stream, such person shall not have the exclusive right to the use or control of such river, creek or stream, or to such constructions and improvements ; but all persons shall have, during the spring, summer and autumn freshets, the right to float and transmit saw-logs and other timber, rafts and crafts, down all such rivers, creeks or streams, and through and over such constructions and improvements, doing no unnecessary damage to the said constructions and improvements, or to the banks of the said rivers, creeks or streams, subject to the payment to the person who has made such constructions and improvements, of reasonable tolls.

3. The foregoing sections, and all the rights therein given, and all the provisions therein made and contained, shall extend and apply to all rivers, creeks and streams, mentioned in the first section of this Act, and to all constructions and improvements made therein or thereon, whether the bed of such river, creek or stream, or the land through which the same runs, has been granted by the Crown or not, and if granted by the Crown, shall be binding upon such grantees, their executors and assigns.

4. The Lieutenant-Governor in Council may fix the amounts which any person entitled to tolls under this Act shall be at liberty to charge on the saw-logs and different kinds of timber, rafts or crafts, and may from time to time vary the same ; and the Lieutenant-Governor in Council, in fixing such tolls shall have regard to, and take into consideration, the original cost of such constructions and improvements, as well as the amount required to maintain the same, and to cover interest upon the original cost.

5. The foregoing provisions of this Act shall apply to all such constructions and improvements as may hitherto have been made, as well as to such as may be in course of construction, or shall hereafter be constructed.

6. All persons driving saw-logs, or other timber, rafts or crafts, down any such river, creek or stream, shall have the right to go along the banks of any such river, creek or stream, and to assist the passage of the timber over the same by all means usual amongst lumbermen, doing no unnecessry damage to the banks of the said river, creek or stream.

7. If any suit is now pending, the result of which will be changed by the passage of this Act, the court or any judge of such court, having authority over such suit, or over the costs, may order the costs of the suit, or any part thereof, to be paid by the party who would have been required to pay such costs if this Act had not been passed.

Mr. Pardee subsequently moved the House into Committee of the Whole and moved that the following clause be added to the bill :— "That every person owning such improvements may make rules and regulations governing the transmission of logs and timber, but no such regulations shall have any force until approved of by the Lieutenant-Governor in Council, who may cancel such regulations and from time to time approve of new ones."

The motion was carried.

Mr. Pardee, still later, added another new clause, providing that the tolls imposed should be a lien on the lumber, recoverable before a magistrate, who, in default of payment, could order the sale of the lumber to secure the tolls. The period during which the lumber is liable to seizure was limited to one month.

The bill was read a third time and passed.

NOT less than 75,000,000 feet of Canadian lumber was imported in Burlington, Vt., last season—a great gain over 1879.

TIMBER ON ROAD ALLOWANCES.

TORONTO, Feb. 24.—In the Legislative Assembly on the motion of Mr. PARDEE, the House went into committee on the following resolutions :— 1. In case the Council of any township organized as a separate municipality, or the Council of any united townships, have passed or hereafter pass any by-law for preserving or selling the timber or trees on the Government road allowances within such township or united townships, and included in any such license, the corporation of such township or united townships shall be entitled to be paid, out of the Consolidated Revenue Fund of this province, a sum equal to two per centum of the dues received by Her Majesty for or in respect of the timber or saw logs which, during the existence of such a by-law, were cut within the said township or united townships, under the authority of such license ; but no corporation shall be entitled to such percentage of the dues received for timber or saw logs cut during the times or seasons when any timber or trees on any such road allowances were cut or removed, for which cutting or removal such corporation had, before the fifteenth day of February, one thousand eight hundred and seventy-one, obtained a verdict against any such license or nominee. All money to be paid, as aforesaid, to any municipal corporation shall be expended in the improvement of the highways situate within the township or within the senior or junior township in respect of which such moneys were paid. 2. The percentage to which the junior township or townships of such united townships may be entitled shall only be in respect of the dues received upon timber or trees which shall be cut after the thirteenth day of April, 1881.

The resolutions were carried without amendments.

PINE CULTURE ON WASTE LANDS.

Hitherto the abundance of natural timber in this country has made it easy to dispense with timber culture, and for the most part our land owners have taken little interest in such slow growing crops. This state of things, however, is rapidly passing away. The demand for special woods for manufacturing purposes is steadily and rapidly increasing, while the natural supply is diminishing and must ultimately become quite inadequate. Meanwhile there are millions of acres of land suitable for timber culture and for nothing else, except poor pasturage, that our land owners are allowing to lie waste and idle for lack of a little forethought, and too frequently our would-be thrifty farmers will risk their surplus means in wild-cat speculations, promising but never yielding large and speedy returns, when the same money spent in planting timber would convert their worthless swamps and stony places into very valuable properties.

A correspondent tells of a piece of land that was planted with walnut 23 years ago. This land was flooded every spring and summer, and was unfit for ordinary cultivation. The trees are now from 16 to 20 inches through, and have been sold for $27,000. No particulars are given as to the cost of planting the grove or the amount of attention it has had during the years of growth. There can be little doubt, however, that the investment was small in comparison with the return, and the land would otherwise have remained entirely unproductive ; to the contrary, the timber crop was so much clear gain. It is clear that our national resources might be enormously increased by a similar utilization by timber culture of lands which are now unused and unproductive ; and the planters will find their groves a surer investment for the security of their family possessions than any savings bank deposit.—*Scientific American.*

LUMBER ON HAND.

The *Lumberman's Gazette* of the 23rd Feb., estimates the amount of lumber on hand in the Mississippi River and tributaries, the Lake Michigan, and the Eastern Michigan and Lake Erie districts, and at miscellaneous points in the same neighborhood as follows :—

	1881.	*1880.*	*1879.*
Miss. Valley..	873,367,528	704,807,256	585,001,797
Lake Michigan	821,440,673	727,267,181	694,576,721
E Mich, L Erie	698,646,768	548,749,000	518,745,000
Mis'c'l's points	116,500,000	78,500,000	89,500,000
Total..	2,509,954,969	2,059,323,437	1,887,823,518

The *Gazette* thinks these figures are probably accurate enough for purposes of computation, if due allowance is made for what has been sold since the reports were made and for that which is not available for immediate use. So far as its being green or dry, that can only be of consequence at points where rail shipments are to be made, for lumber cut last fall will be considered fit to go on the market as dry by the time navigation is open.

MIDLAND TIMBER SUPPLY.

The following is the estimate of the timber tributary to the Midland Railway for 1881 :—

Smith & Macdougal	150,000
Maxwell	100,000
H. H. Cook	100,000
Burton Bros	200,000
Nagle	150,000
Stennett	25,000
B. C. L. & T. Co	100,000
Coulson	50,000
Irwin & Boyd	250,000
Strickland Bros	130,000
M. Boyd	20,000
Thompson	40,000
	1,375,000

It is estimated that two-thirds of this amount will consist of board timber.

TORONTO is estimated to have consumed 40,000,000 feet of lumber, 15,000,000 of laths and 10,000,000 shingles during 1880.

NOTICE.

The undersigned having transferred the CANADA LUMBERMAN to Messrs. Toker & Co., Peterborough, it will in future be published by them. The facilities possessed by this extensive and old established house, and the high reputation of the publishers, should be a guarantee that the LUMBERMAN will command a prominent position amongst the leading journals of the day. Those who should patronize it are a wealthy and influential class. The field is ample, and as the undersigned made the transfer above referred to with a view of improving the LUMBERMAN, he feels assured that it only requires the combined support of those in whose interest it is published to ensure it that success which was anticipated when he first established it.

All sums due for subscriptions must be paid to TOKER & Co., or their duly authorized agent.

ALEXANDER BEGG.

February 24, 1881.

The Canada Lumberman

DEVOTED TO THE LUMBER AND TIMBER INTERESTS OF THE DOMINION.

PUBLISHED SEMI-MONTHLY BY

TOKER & Co. PETERBOROUGH.

Terms of Subscription:

One copy, one year, in advance	$2 00
One copy, six months, in advance	1 00

Advertising Rates:

Per line, for one year	$0 90
Per line, for six months	50
Per line, for three months	30
Per line, for first insertion	10
Per line, for each subsequent insertion to 3 mo's.	05
Cards not occupying more than 12 lines (1 inch) per annum	8 00
Cards not occupying more than 12 lines (1 inch) for six months	5 00
Cards not occupying more than 6 lines per annum	5 00
Cards not occupying more than 6 lines, for 6 mo's	3 00

Special rates will be made for page, half page and column advertisements.

Advertisements intended for insertion in any particular issue should reach the office of publication at least three clear days before the day of publication, to insure insertion.

All communications, orders and remittances should be addressed and made payable to TOKER & Co., Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

Travelling Agent.

MR. A. L. W. BEGG has been appointed agent for the CANADA LUMBERMAN, and is authorized to collect subscriptions and grant receipts therefor and to make contracts for advertisements appearing in its columns.

PETERBOROUGH, Ont. MARCH 15, 1881

INTRODUCTORY.

In undertaking from henceforth the publication of THE CANADA LUMBERMAN, we feel that it is due to our readers to lay before them the principles on which the management of the paper will be conducted, which we trust will be such as to benefit the trade and to secure its support. Peterborough is not without its advantages as the location of the organ of the lumbering interest. The operations for which it is the base are of considerable importance and it is situated centrally between the great sites of lumbering activity of the Ottawa, the Bay of Quinte and Georgian Bay. Thus it will have no sectional preferences or prejudices, but fairly represent the trade at large.

THE CANADA LUMBERMAN will be purely a trade organ, and will be absolutely non-political. It will contain those accurate statistics which are necessary to the trade as a basis for intelligent operations. Not only will the markets, with which the trade have to do, be carefully reported, but the most trustworthy information possible will be obtained from each locality of the production of timber and lumber, and of the stock in hand. In this respect, however, we feel that we need the co-operation of the trade, and no information could be so satisfactory as what might be supplied by a local secretary or some other recognised representative of the trade for his particular section.

We will aim not only at advocating any measure that may be for the advantage of the lumbermen, but at affording a means by which they may express their wants and wishes, or exchange ideas on subjects of interest to them. By this means also we hope that their mutual action may be facilitated. With this view we will gladly receive communications from those interested in this great industry.

We also trust that THE CANADA LUMBERMAN may be a medium through which improvements in machinery, and other matters intimately connected with the production of lumber or timber, may be brought under the notice of the operators, who may thus readily find in our advertising columns information which would be found with difficulty amid the varied announcements of other journals. The value of such a medium will be readily appreciated by the lumbermen, and by all those having dealings with them.

All information of value to the trade at large will be diligently collected, and matters of interest to them will be discussed and advocated.

THE LUMBERMAN will advocate the establishment of a Bureau of "Woods and Forests" in connection with the Provincial Government. It is generally admitted that the interests of the Provincial treasury are identical with those of the limit holders, and there is room for legislation to protect the public revenue, while at the same time guarding the vested rights of the timber licenses. We would call attention to the following statistics of the receipts from forests and Crown Lands in Ontario alone since Confederation:—

Year.	*Woods and Forests.*	*Crown Lands.*
1867 (6 months).	$ 107,648 61	$ 59,090 49
1868	234,209 85	134,983 57
1869	435,630 78	211,163 95
1870	425,901 07	121,036 49
1871	215,973 28	453,403 20
1872	903,952 19	193,168 98
1873	643,637 56	189,665 36
1874	342,943 97	162,154 43
1875	449,354,75	80,014 41
1876	437,998 77	82,254 49
1877	426,556 67	86,750 29
1878	284,816 62	62,452 77
1879	332,014 47	45,670 22
1880	501,442 17	38,867 90
Total	$5,742,080 76	$1,920,676 55
Average receipts	$425,339 30	$142,339 30

It requires no great effort of the imagination to perceive, that with a continuance of the present system, the period is approaching when the sources of the yearly revenue and of the past surpluses of Ontario, derived from the bonuses accruing from timber lands and the Crown dues on logs and timber, will no longer exist, and when the means for the public expenditure of the Province, to this extent, will have to be derived from some other channel. Although it is now late, practical and judicious legislation may postpone this evil day. THE LUMBERMAN will, from time to time, with the aid of the collective information and suggestions of the operators in the lumber trade, suggest how this may be done. Unfortunately, in the past, legislation has brought the settler and the lumberman into antagonism. Without discussing how this has been brought about, it will be a leading object of this paper to uphold that purely timber areas should not be left open to settlement until the tfmber has been exhausted. To determine and locate these timber areas, is a matter that should be dealt with at once by the purposed Bureau of Woods and Forests. It may be asserted that the present Crown Lands Department is a Bureau of Woods and Forests, but a very slight acquaintance with its workings and a retrospect of its management would show the correctness of the ground we are determined to maintain that a department which has to deal both with our timber areas and with the sale and settlement of our Crown Lands has a double responsibility upon its shoulders that cannot be carried out satisfactorily to the public. The process might be, that in the first place all the wild land should come under the supervision of the Bureau of Woods and Forests. Their dictum being obtained as to what portions should be reserved for lumbering operations, those lands excluded by them as not strictly fulfilling the conditions of a timber area, should then be dealt with by the Crown Lands Department and exposed for sale from time to time as might be deemed advisable. Unfortunately in the past succeeding Ontario Administrations have thrown into the market large areas of timber limits purely and simply for the purpose of creating surpluses, which have given them a great deal of trouble to dispose of to the general satisfaction of the different parts of the Province. Had the evil stopped here, however, it would not have been so bad, but as the public are aware, there is a sort of fictitions settlement that invariably follows the track of the lumberman, and will continue to do so if the lands are open for sale. It is generally this fictitious settlement that has originated those large fires which have destroyed, as it is claimed, almost a third part of the pine timber of Ontario. The course we suggest for dealing with this question would reduce this fire risk to a minimum.

The plantation of new forests would also properly come under the jurisdiction of the Bureau of Woods and Forests. These and other important questions as they arise will be dealt with by THE CANADA LUMBERMAN in the interest of this most important industry, and we trust so to advocate their views as to be looked upon as their representative and to secure their support.

WANTED.

The Publishers of the CANADA LUMBERMAN desire to obtain a reliable and well informed correspondent in every lumbering centre in the Dominion of Canada, and to that end would ask those disposed to act as such, to communicate with them at once, stating the facilities they possess for obtaining *reliable*, early and full information as to the lumber trade in their respective districts, and the renumeration which they will expect for their services as such correspondents.

Chicago's Lumber Trade.

In the attempt to give an idea of the extent of the Chicago lumber trade at the present time, figures delude and dissatisfy. It is easy to say that the city handled, in 1852, 148,000,000 feet; in 1872, 1,184,000,000 feet; in 1879, 1,500,000,000 feet—the last figures representing one-third of the entire manufacture of the North-West: but "millions" convey no startling idea to the layman's mind. It may help a little, however, to mention that to bring this lumber into the city would require average arrivals of thirty cargoes per day for two hundred days, each containing a quarter of a million feet; or that if a number of canal boats, each containing one-eighth of a million feet, were loaded with the importation of 1879, and placed in a line in the Erie canal, they would reach, touching end to end, from Albany to Rochester—three hundred miles.—*Harper's Magazine.*

TO OUR READERS.

The publishers of the CANADA LUMBERMAN regret that in the first issue under their management they are compelled to ask the kindly forbearance and consideration of its subscribers and readers for the short comings connected with the present issue. As most of them will easily understand it is no easy matter to increase both the "out put" and "variety" of a "mill's run" on a moment's notice, and yet that is just what the present publishers have been called upon to do, both in the editorial and mechanical departments of their printing mill.

The reader will, no doubt, observe that the publishers turn out the LUMBERMAN in an entirely new dress, which, independent of the change of place of publication, involved considerable extra labor and loss of time in procuring the material therefor, and that instead of filling its columns largely with general reading matter taken second-hand from their other publications, they have filled it throughout with matter pertaining specially to or having a bearing upon the trade in whose interest it is published, even though the selection may not be all that could be desired, and certainly not such as they hope to make it as soon as the various parts of the machinery connected with its publication have been completed, and got into proper working order.

Bearing these things in mind and remembering that it was only on the 25th ult.—one week before the present number should have appeared—that the present publishers came into possession, they trust that the late appearance of this number will not only be held excusable, but that the decision to date it ahead to the 15th and thus omit the one which should have appeared on the 1st of March, in order to give them a fair start, will meet with approval, and that the evidences contained in the present number of the publishers' desire to render the CANADA LUMBERMAN what its name implies, will obtain for them that sympathy and support through which alone they can hope to attain success in their present undertaking.

CANADIAN LOG OPERATIONS.

The *North-western Lumberman* in referring recently to this winter's operations in Canada, under the above caption, concluded with the following paragraph:—

"The Government of the Dominion of Canada not long since issued an Order in Council increasing the taxes upon timber from 10 cents per log, for logs 16 feet and under, and 15 cents for all over that length, to 12½ cents on the shorter, and 20 cents on the longer. Against this the lumbermen have made a most vigorous protest, the new rates being considered outrageously high. The Premier urges the great need of teh Government for a higher revenue, but while holding out no encouragement that a reduction can be hoped for, will lay the matter before the Cabinet."

Our excellent contemporary is astray in the above statement. The Dominion Government imposes no taxes either on timber or logs except for the use of slides and booms, constructed and maintained by the general Government and for culling; in respect of which no increase—nor indeed change of any kind has taken place for some years. Each Province of the Confederation of Canada has control of its own timber, which was so arranged at the time of Confederation. The only timber owned by the Government of the Dominion is in the Province of Manitoba and the North-west territories in charge of the Department of the Interior, and no increase such as that referred to by our Chicago contemporary has taken place and fees or dues imposed on the products of limits for which licenses have been granted them. It is probable that the *North-western Lumberman* has reference to an Order in Council passed in November last by the authorities of the Province of Quebec, increasing the dues on sawlogs in that Province, in opposition to which the lumbermen interested held a meeting at Ottawa in December last, and passed resolutions asking the Local Government to modify the Order.

Mr. DAVID MOORE has sold his limits west of Pembroke to Mr. J. R. Booth for the sum of $133,000.

THE LIVERPOOL BROKERS' ANNUAL CIRCULARS.

The Liverpool brokers are in the habit of making up their yearly returns to January 31st, so that we have only just now received the following annual circulars—many of them very ably compiled—from which we take the following extracts :—

Messrs. Farnworth & Jardine state that the past year commenced with improving prospects, and the trade looked forward to a more active and profitable business ; stocks generally were low, prices moderate, and advices from abroad all indicated a moderate production for the year; buyers were thus encouraged to operate rather freely early in the season, which unfortunately had the effect of unduly forcing the production abroad, especially of deals, and so to some extent nullifying these favorable expectations ; however, there has been an improving trade, and, with a few exception, the results have been fairly satisfactory.

In the aggregate the import has been 53 per cent. in excess of 1879, and 8 per cent. beyond the average of the last seven years. The consumption has also increased, but not in the same ratio as the import, having been only 25 per cent. in excess of 1879 ; but still it does not reach the average of the last seven years by 1 per cent. The stock is much in excess of last year, which was unusually light, but it is also 13 per cent. more than the average of the last seven years, and is somewhat unequally distributed. It may, however, be noted that the stocks at the American shipping ports are unusually small, therefore the imports during the next few months are likely to be on a much reduced scale.

Prospects are fairly promising for a moderate and steady trade, but last year's supplies were too large, and, as we commence the year with full stocks, we must strongly urge upon shippers to use a little more judgment and discretion, and not press on the market every foot of wood they can possibly produce, otherwise all calculations will be upset, and both shipper and receiver must suffer.

Messrs. Duncan, Ewing & Co. state that the year just ended cannot be said to have been an unsatisfactory one, though it has been shorn of much of the brightness it showed in its earlier months, by the excessive imports which were poured into the market during the latter portion of the import season. Prices have given way recently under the continued pressure to sell, and, as the stocks on hand are quite ample to meet the probable wants of the market until the opening of next import season, there is little chance of any improvement taking place. Looking at the state of matter as it exists at present, the fact that speculative building has been carried to an excess in nearly every part of the north-west of England, and the stocks on hand in Liverpool and other adjacent ports are, apparently, more than will suffice for the next six months, it is evident that the utmost caution should be used by exporters in sending supplies of timber, deals, etc., to this part of the country. At the same time, the brighter side must not be lost sight of ; business throughout the country has slowly but steadily increased, and a feeling of confidence in the future improvement of the general trade of the country is making itself felt. So far as regards the timber trade, much of the effects of this revival will be discountad by the heavy stocks now on hand, which are ready to meet any increased consumption as soon as it sets in.

Fifteen Hundred Miles a A Minute.

The cable message to Australia respecting the Hanlan-Trickett match was an ordinary achievment in telegraphy—in fact, it has never been excelled. The total extent of lines—namely, 12,000 miles—was travelled in one hour and twenty minutes. The greater portion of this time was occupied in transmitting the message through India. From Singapore to Sydney, 5,070 miles, the message occupied only thirty-five seconds in transmission. This message was repeated fourteen times, from station to station, between London and Sydney.—*Sydney Mail.*

Messrs. Bronson & Weston have taken out about 100,000 logs on the Schyan and Black Rivers this winter, of fine white pine, cut on the limits bought from the Egan Estate.

DEFERRED NOTES.

BRANTFORD CITY.

When in Brantford recently, we were shown. in the works of the Waterous Engine Company, a portable flour-mill, complete in itself. It only occupied a floor space 12x20 feet and stood 12 feet high. The wheat was first elevated into the smut mill ; thence into the hopper over the stones ; thence through the 20-inch standard mill-stones, conveyor and elevator to a portable bolting chest, from which the flour in different grades is discharged. The mill, which was ready to be shipped, has a capacity of turning from 6 fo 7 bushels of wheat into good flour per hour. These mills being well adapted to the wants of large lumbermen, are being added to saw-mills in New Brunswick, Nova Scotia and Manitoba. Whilst visiting the Waterous Works we noticed a ship-yard carriage, capable of cutting stuff 60 feet long. It was complete and about to be shipped to Messrs. W. & R. Wallace, of Gardner's Creek, New Brunswick, to be run by one of the Waterous Co's 30 H.P. portable direct action saw-mill engines. It has in the front part of the carriage a special arrangement for taking ship-knees, and facing them with the large saw on each side. This is a most important addition to carriages for ship-yards, and one that lumbermen should look into. We were informed that this firm are working on portable saw-mill orders from Chili, S.A., Australia and Germany, as well as on the ordinary orders for the Provinces of the Dominion, from Nova Scotia to British Columbia. They complain of having to suffer loss in the matter of rebate on materials used in the manufacture of engines, etc., exported to foreign countries, as it is found impracticable to separate the particular items from invoices in which the materials used for other work were included at the time of purchase.

TOWN OF BRAMPTON.

This thriving place is making rapid progress. A number of buildings are to be erected this spring. Here we met Mr. McIntosh, manager of the Caledon Quarries. Those quarries have sent out during the winter, by the Credit Valley Railway, about 260 car loads of stone—both red and grey freestone. There will be a large trade done in this splendid stone next summer ; and there should be, when it becomes known that it is free from iron, and works almost as easy as the Ohio sandstone, whilst the latter costs about $1 per foot more than the former, laid down in Toronto. Mr. McIntosh has had about forty men working during the winter, and will have twice the number in the spring, when a switch will be completed from the railway to the quarry bed, and even under the level of the bed, as the quarry is on the side of a mountain of freestone, having beds of all thicknesses up to five feet, which improve in quality as the strata are followed up. Judging from specimens of the stone in the yard of the Ontario Legislative buildings, it is admirably adopted for monument bases. Any quantity of the best limestone for building railway bridges can also be furnished from these quarries.

Salicylic Acid in Foot-and-Mouth Diseases of Cattle.

The Duke of Brunswick has of late successfully combated the ravages of this much dreaded enemy on his estate at Stampen, near Oels, in Prussian Silesia, by treatment with salicylic acid, the well-known antiseptic. Instead of several weeks required to effect a cure with the remedies hitherto employed, truly surprising results have been brought about within a few days by this new treatment. A solution of the acid is prepared by pouring some hot water on about three tablespoonfuls of salicylic acid in an earthen vessel, and adding lukewarm water to make up a gallon. The mouth and feet of the diseased animal should be carefully washed three times a day with the liquid, and the tops of the hoofs well powdered with the dry acid after each ablution. The effect will, moreover, be greatly increased by salicylating the drinking water of the beasts by the addition of two tablespoonfuls of the acid dissolved in hot water. During the above treatment great attention must be paid to the perfect cleanliness of the stables or sheds. The dung must be saturated with salicylic acid solution to prevent further infection, but it is chiefly in the dung that the germs of the disease are to be found.

HEATING ROOMS.

In some new styles of open fire-places recently introduced in France, use is made of a hot-water circulation to warm one or more chambers from waste heat of an open fire in a room below. Seventy percent of the heat of an open fire, whether of wood, coal, or gas, is spent in heating the chimney flue, or is thrown away out of the top of the chimney. Attempts to save this waste heat have been often made, and there are base-burning stoves in this market that heat two rooms, the one below by a stove and the one above by a hot air flue in the chimney. These stoves work well, but are still somewhat wasteful and are generally vicious, because the air heated in the flues is often taken from the room below, instead of from out-of-doors. The Frenoh stoves made on this plan appear to be of much better design, as they have more heating surface. The water circulation stoves consist simply of a cast-iron water-back placed in the chimney above the open fire, and connected with a system of flow and return hot-water pipes in the rooms above. A cheap and unpatented method of economizing the heat of an open fire would be to give the fire a rather large flue, and in this flue, extending downward from the room above and reaching nearly to the fire-place, to hang two pieces of wrought-iron pipe (an inch in diameter), joined at the lower end by a common coupling, or "return bend." One of these pipes must be a few inches longer than the other and must be connected with the flow-pipe of a hot-water system, the shorter pipe connecting with the return pipe. Every housekeeper is aware that a few feet of brass pipe bent around the inside of a cook-stove will supply a family with abundance of hot water, without apparent effect on the fire. The stove cooks as well with the pipe as without it, and the heat in the hot water is a direct saving of heat that would otherwise go up the chimney. In like manner, a length of pipe hung in a chimney will save heat that otherwise would be lost, and by a well-designed water system the heat may be used to warm a room on the second floor. Where strong coal fires are maintained in open grates, a second pipe reaching down from the third story might also be added, and another room might be warmed by the same fire.—*Scribner's Monthly.*

Failure of Another Railway Viaduct.

Following the destruction of the Tay bridge now comes intelligence of the destruction, on Feb. 6, by ice, of a section of the Solway Viaduct, the most important part of the Solway Junction Railway, and until this week, a connecting link between England and Scotland. In former years the thaw has been accompanied by high winds, breaking up the ice and saving viaduct ; but this season no wind has arisen, and the packs have been carried down in unbroken masses, hurling themselves against the piers, carrying everything before them. The accident has been unattended by any loss of life, owing to the vigilence of the railway authorities, who had watchmen stationed, who gave timely warning.

The structure is very similar to the Tay bridge in construction and size. The viaduct is about a mile and a quarter in length, and about 40 ft. in height ; the spans are in groups of seventeen of 30 ft., each group being connected by a span of 5 ft.

Some idea of the force of the floating ice may be formed from the narrative of the fishermen, that for some days the channel was covered with fields of ice acres in extent from 6 ft. to 12 ft. in thickness. The crashing of the ice as it swept along, borne by the current at the rate of twelve knots an hour, was heard two or three miles off, they said, and even half a mile away from the viaduct the noise was audible, although the wind was blowing in the opposite direction.

Erie Canal Tolls.

ALBANY, N. Y., March 8.—The Canal Board to-day adopted a resolution abolishing tolls on western-bound freight, and placing on the free list salt manufactured in the State and under the supervision of State officers, all voting affirmative except Dutcher. On motion of Ward the Albemarle fertilizer was placed on the free list. Last year's toll sheet on the Black River Canal was adopted. Seymour's resolution prohibiting the passage of rafts on the canals after September was reconsidered and amended so as to apply only to the Black River Canal.

NORTH-WEST TIMBER LIMITS

Statement of timber limits granted in the North-west and Keewatin up to 2nd of Feb., 1881, are as follows: Richard Fuller & Co. timber limit on the Lake of the Woods, 38,400 acres ; Macauley, Ginty & Sprague, timber limit in the vicinity of Roseau River, 32,000 acres ; Macaulay & Ginty, 32,000 acres on the Winnipeg River ; W. J. MacAulay, 64,000 acres between the Lake of the Woods and Rainy Lake ; Capt. H. S. Moore, limit of 32.000 acres on the North Saskatchewan ; Stephen H. Fowler, 64,000 acres on Rainy Lake and Seine River ; Dick & Banning, 12,800 acres on Sandy Bar Creek, Lake Winnipeg ; Joseph Whitehead, 61,440 acres on the Whitemouth River, Keewatin ; Hugh Sutherland, Patrick Kelly, Pratt & Smith, Joseph Whitehead and Peter MacArthur, 477,760 acres on Lakes Winnipegosis and Water Hen ; annual licenses to D. W. Cummings, Stratford, 30,720 acres ; Joseph Sherman and John Pratt, Stratford, 51,200 acres ; Donald Gunn, Shoal Lake, 20,480 acres ; Alexander Cameron, Hallsford, N.W.T., 12,800 acres ; R. McIntosh, Rapid City, 40,960 acres ; J. S. Armitage, Hallsford, 20,480 acres ; Edward Roberts, Winnipeg, 28,160 acres ; Albert Hudson & Co., Portage la Prairie, 840 acres ; Wm. Hardie, Winnipeg, 6,400 acres ; R. Z. Rogers, Grafton, Ont., 4,480 acres. Timber limits of 46,400 acres on the Winnipeg River were granted to Wm. Stubbs, Ottawa, of 64,000 acres on the Fairford and Shell Rivers to Messrs. Shields. Haggart, McLaren and Nichol ; 40,960 acres in the Little Saskatchewan to Messrs. Armitage and McCulloch ; 7,200 acres in the Turtle Mountain district to Messrs. Williams and Harrison ; 2,304 acres on the Bird Tail Creek to John McBeth ; 4,080 acres in the Little Saskatchewan to David McFadden, and 13,440 and 4,480 acres respectively in Manitoba to A. Watts and R. Z. Rogers.

A New Insect Pest.

According to the Banger, Me., *Commercial*, the primeval forests of this continent are now attacked by a small but exceedingly destructive insect that insidiously cuts into and kills the monarchs of the woods. It is noticeable that on forest lands where cutting has been prosecuted and the sunlight has been let into the tangled wild woods, the trees are not attacked, and the sun appears to be the natural annihilator of the pests. They, as yet, attack only spruce trees. It is the testimony of Mr. Jack, the Crown Land Agent of the Province of New Brunswick, that the destroyer attacks the forest primeval. It is nature's design that the old trees should be cut down to make room for new generations. The operation of the insect is as follows :—In July or August a gay little beetle settles upon the bark of the noblest trees, and lays a few tiny eggs; after a short time a small worm similar to a maggot hatched, and then the busy work of the destroyer begins. The worm eats his way to the very heart of the tree, until at last it falls a wreck. So insidious is the operation that many trees which are bored through and through, are green at the top and apparently sound, but a blow of the axe or the force of a gale causes them to fall, and their worthlessness is revealed. At present, the trouble from these pests is confined to the timber country watered by the Upper Kennebec, and that in parts of Aroostook and the Provinces. In consequence of the forests of New Brunswick having been attacked, Mr. Alexander Gibson, will cause 50,000,000 feet of spruce to be cut this winter on the Nashwaak, for if left standing longer the worms would render the lumber worthless.

Extensive Enterprise.

A paper manufacturing firm purposes converting twenty thousand acres of timber-land in Somerset County, Pennsylvannia, into paper. A large gang of workmen has been sent to the tract to begin improvements. There will be erected a shanty 50 ft. in length, 12 ft. in width and 8ft. high. The shanty once completed, work will be begun on a large store building thirty dwelling-houses, and an enormous digester for the cooking and steaming of wood in the manufacture of pulp, and a huge building to be used in the manufacture of paper sacks and wrapping paper, All these preparations are preliminary to reducing 20,000 acres of forest to news, book and fine writing papers.

VARIETIES OF THE PINE.

A recent correspondent of the *Timber Trades Journal*, of London, expressed a sentiment of bewilderment which is probably not confined to England, but exists as well among many well-informed people in this country, and asks an explanation of the terms, "white pine," "yellow pine," "red pine," "Norway pine," etc. He truly remarks that white pine and yellow pine seem to be much alike, and but for the different designations given in different localities would not be distinguishable. The *Trades Journal*, as we remember its reply, asserted that the white and yellow were identical as the terms were used in the English trade, and that the red pine of commerce was what was known as Norway in North America. The fact is that the botanical classification of the timber growth of the American continent recognises no less than twenty-nine distinct species of the *Pinus* family, including distinctive white, red, yellow, and pitch pine designations. Of the white pine family, *Pinus strobus*, sometimes known as Weymouth pine, occupies the foremost place as a commercial wood, and is found from Newfoundland west to the Saskatchewan river, including Canada, Michigan, Wisconsin, and Minnesota, extending south, through the New England States, New York, Pennsylvania, and along the Alleghany mountains to Georgia. It is a white, soft-grained wood, easily worked, a favorite in house-building, and forms the principal wood of the lumber traffic and manufacture of the north and north-west, to which localities its production is now mostly confined. It grows from 80 to 150 ft. in height, and attains a size as great as 6 ft. in diameter in individual cases, the majority of that having a commercial value, however, being from 12 to 48 in. in diameter at the stump. This variety is known locally by designations varying in different localities, and includes the cork, bullsap, grove, sap, buckwheat, sugar, and other designations, applied to different stages of growth and development, or characteristics derived from peculiarity of soil.

The white pine, *Pinus flexilis*, of the Rocky mountain range, from Montana to New Mexico, on the high mountain ranges of Nevada and Arizona, on the Inyo mountains and Mount Silliman in California, is of a similar nature to that before described, being soft in wood, white, and of fair quality. It grows, however, only from 50 to 60 ft. in height, as a rule has a trunk from 24 to 48 in. diameter, and is a good tree for lumber. Its quality is intermediate between the eastern pine and the sugar pine proper.

The sugar pine, *Pinus Lambertiana*, is a distinct species from what is frequently spoken of in the north as sugar pine. It is a wood resembling the eastern pine, but is of a coarser grain, heavier, and stronger, grows to a height of from 150 to 300 ft., and its trunk reaches from 10 to 20 ft. in diameter. It is found on the west coast ranges, from the Santa Lucia mountains, along the Sierra Nevadas—especially on the western flank, at an elevation of from 4,000 to 8,000 ft.—and in Oregon, north to the Columbia river.

The above oonstitute the principal varieties of the white pine family, as classified by Professor Sargent, of the United States census commission, although there are several other varieties of an obscure and less valuable character, entering but little, if at all, into commercial uses.

Yellow pine, *Pinus ponderosa*, is a product of the Pacific coast. It is found in California and Oregon, principally on the western slope of the Sierra Nevadas, and is the most valuable of the western pines. Its wood is yellow, hard, heavy, strong, and durable. It is a large tree of a height of from 200 to 300 ft., with a trunk from 12 to 15 ft. in diameter. It is found extensively along the eastern slopes of the Sierra Nevadas, where it attains a lesser height, being from 100 to 200 ft. above the elevation of 5,000 ft., and having a diameter of from 10 to 15 ft.; it is often found in most arid situations. It is also found throughout the Rocky Mountains, from British Columbia to New Mexico and Arizona, where it grows to but from 80 to 100 ft. in height.

In the family of yellow, we have also a variety, *Pinus mitis*, known as yellow pine, short-leaved pine, and spruce pine. It has a wood yellow in color, hard and compact, and quite durable, growing to a height of from 40 to 70 ft., rarely exceeding 24 in. in diameter. It has been seen as far north as Staten Island but in few cases, and is found as far south as Florida and Alabama, on the Ozark Mountains of Missouri, where it is the only pine, and in Arkansas. Its wood is used for similar purposes as the yellow pine of the south, to which it is inferior.

The yellow pine, long-leaved pine, southern pine, Georgia pine, brown pine, hard pine, by which designations is known the one variety of *Pinus Australis*, or *Pinus palustris*, is found from southern Virginia to Florida, and Mississippi, Louisiana, the valley of the Red River of the South and eastern Texas, extending seldom into the interior more than 100 miles from the coast. It is strong, compact, straight in grain, has light sap, is very durable, and is the true pitch pine, although differing from *Pinus rigida*, to which the term pitch has been given. It is from *Pinus Australis* that the bulk of the turpentine, tar, pitch, and resin produced in the United States is derived. Its growth is from 60 to 100 ft. in height, with a trunk of from 24 to 48 in. in diameter, affects a dry, sandy soil, and is found rarely in low swamps. It is the commercial yellow pine of the south, *par excellence*.

The pitch pine, *Pinus rigida*, is found in Maine and Vermont, and extends to the upper districts of Georgia, and is but little found west of the Alleghanies. Its wood is heavy and resinous, and when grown in low ground is soft and largely sapwood. It grows to a height of from 40 to 80 ft., reaching sometimes 30 in. in diameter, and affects a dry, barren, sandy soil, or a deep swamp. It is included in the cheapest grades of lumber.

Norway pine, sometimes called red pine, *Pinus resinosa*, or *Pinus rubra*, is a growth of the north-west, being found in Canada and the New England States, south to the mountains of Pennsylvania and west to Minnesota. Its wood is light-coloured, resinous, hard, heavy and durable in dry situations, used somewhat for ship-building, and in the west for joist and other building timber. It is usually from 60 to 80 ft. in height, although in the forests of Michigan, Wisconsin, Minnesota, and the British Provinces it attains from 100 to 150 ft., with a trunk from 15 to 48 in. It affects a high, sandy soil, and in favourable locations resembles the wood of the spruce, being equally white. As a rule it borders more closely on the yellow pine of the south, and we are at a loss to understand, from the general character of the two, why it should ever be classed among the reds rather than the yellows.

Redwood proper, *Sequoia sempervirens*, is exclusively a California tree, resembling the white pine in grain and texture. Its colour is a decided red; it is light, close-grained, compact, easily split and worked, is susceptible of a fine polish, is very durable, and in California is sawed into boards and shingles, furnishing the cheapest lumber, fencing, posts and ties of the Pacific coast, and being quite accessible to tide water, is likely to be soon exterminated. It reaches a height of 200 to 300 ft., with a straight, cylindrical trunk of 8 to 12 ft. in diameter, free from limbs to a height of 80 or 100 ft. Unlike the *Pinus* group, the stumps and roots throw up great numbers of vigorous suckers, which would indicate a capacity for cultivation. This wood is seldom seen in the east, except in the shape of packing-boxes, in which goods have been brought from the Pacific ooast. California has also a red wood, *Ceanothus spinosus*, found in the coast ranges, but it is a small and insignificant tree, of little or no commercial value.

The varieties of pine which our English cousins come in contact with from this continent are the white pine, *strobus*, in its different subdivisions, some of which are sufficiently rich in color to lead to no surprise that they should sometimes class it as yellow, although in fact we doubt if a true yellow pine stick is ever seen by them except as it comes from the south, and is known as Pensacola, Fernandina, Georgia, etc.

They also receive of the Norway *Pinus resinosa*, which no doubt has been recognised by them as a red pine, through its botanical description rather than classification as *resinosa*, and this description is measurably warranted by the reddish cast of the thin bark of the growing tree, although the wood partakes more of the pitchy character of the yellow pine of the south. From southern ports they obtain what is known in this country as yellow pine, the variety *Australis* or *palustris*, or that of *mitis*, which, while more properly called pitch pine, has by common consent and custom become known as yellow pine, but should not be confounded with the true yellow, or *ponderosa*, of the Pacific coast, the timber of which is free from the resinous character of the *Australis*, or the *mitis*, or yet of the *resinosa*.—*North-western Lumberman.*

SUBSTITUTES FOR LUMBER.

We are in receipt, from Mr. S. W. Hamilton, of Lawrence, Kansas, of a sample of lumber made from straw, manufactured after a process patented by himself, the particulars of which he does not explain. He informs us, however, that he can manufacture lumber like the sample sent, in any desired length, from 12 feet upward, and to 32 inches in width, at a cost competing with the better or finishing grades of pine, although he does not inform us whether this competition will apply equally to sections where lumber is comparatively cheap, as at Chicago, and at Western grain producing points, as at Kansas. We imagine, however, that the expense will vary but little at any point where straw is obtainable in large quantities.

The manufacture is, of course, confined to a grade which will compete with the better class of lumber, as there would be no object in filling the new product with knots, and shakes would scarcely be obtainable even if desired, while sap and decayed wood must be impossibilities. The sample sent to us will hold a nail as well as wood, is equally susceptible to a high painting finish, and can be polished to as high a degree as is at all desirable. Being made waterproof, we can discover no possible reason why it should not be as durable, or even more so, than pine or even oak, while its adaptability is evidently as great for roofing purposes, as for the fine work of a dwelling.

The question of cost appears to us to be the most important element yet to be practically solved. We can see no reason why it is not susceptible of being worked under the plane or other ordinary tools of the carpenter, and when once fitted to its place, we can readily believe that it will be free from shrinkage or swelling. In appearanoe, the sample before us resembles hardwood, being about as dark as oak and more dense in texture, with a specific gravity one-fifth greater than thoroughly seasoned black walnut. For finishing purposes, it will not, as a rule, be necessarily as thick as ordinary lumber, its tensile strength being apparently double that of wood of the same thickness. On the whole, we are favorably impressed with the appearance of the new artificial lumber.—*N. W. Lumberman.*

How to Use Oil Stones.

Instead of oil, which thickens and makes the stones dirty, a mixture of glycerine and alcohol is used by many. The proportions of the mixture vary according to the instrument operated upon. An article with a large surface, a razor, for instance, sharpen best with a limpid liquid, as three parts of glycerine to one of alcohol. For a graving tool, the cutting surface of which is very small, as is also the pressure exercised on the stone in sharpening, it is necessary to employ glycerine almost pure, with but two or three drops of alcohol.

Cement for Leather.

One who has tried everything, says that after an experience of fifteen years he has found nothing to equal the following as a cement for leather belting: Common glue and isinglass, equal parts, soaked for ten hours in just enough water to cover them. Bring gradually to a boiling heat and add pure tannin until the whole becomes ropy or appears like the white of eggs. Buff of the surface to be joined, apply this cement, and clamp firmly.

THE *Northwestern Lumberman* says that the cedar post and telegraph pole business, which languished during 1880 for want of adequate supplies, seems likely to be overcome during the coming season, and that unless trouble is experienced in obtaining transportation, there is ittle probability of cedar being in short supply at the distributing points on the chain of lakes during 1881.

CEDAR PENCIL-MAKING.

From the forests of Florida the timber is received in roughly-squared logs about fifteen feet in length and eighteen inches square. After being opened—that is, sawn into two pieces by an ordinary double-handed saw—in the saw-pit, the timber is allowed to season. This period of probation being passed, the logs enter the wood-cutting room. Here the timber is cut up into the required lengths and thicknesses by circular saws, but as they cannot be relied upon to produce absolutely true surfaces, the "leaves," as they are termed, are passed under a thicknessing or planing machine, which reduces them to a perfectly uniform size. From this room the "leaves" pass to a second wood-cutting room, where, following their progress, we find them again sawn up into slips or scantlings, and which are technically termed "tops" and "bottoms." The latter is the portion into which, after being grooved, the lead is inserted, while the former is the covering that protects it, the one slip being just half the thickness of the other. The operations of cutting the "tops" and "bottoms" and grooving are performed by little machines running at the almost inconceivable speed of 7,000 revolutions per minute. The groove cut corresponds exactly to the size of the stick of lead to be inserted. From this department the cedar slips are passed on to the "filling in" room, where, while one operator inserts the lead, another glues the "tops" on. The "glueing up" operation being performed, the pencils are placed in a frame and tightly screwed into position. When firm and dry they are placed in a clump a gross at a time, and the ends cut off by means of a circular saw, in order to make the pencils one uniform length. The next operation is the rounding of each pencil, and the marvellous ease, precision, and regularity with which this is performed renders it one of the most beautiful in the entire manufacture. The square pencil is inserted in a small machine containing a rounding chuck running at a high rate of speed. Before the eye can seize all the details of the process the pencil has come out at the other end of the machine rounded to a nicety, without flaw or blemish. One such piece of machinery will turn out twenty gross *per diem*.

Walls and Beams.

One precaution that is very seldom taken with high buildings is so supporting the timbers of the floor that, in case they break or fall, they shall not pry the wall over inward, and in case they expand they will not push it over outward. As ordinarily constructed, holes are left in the walls, into which the ends of the joists are set, the holes being about the size of the ends of the joists, so that in case the floor falls the timbers are apt to tumble the walls inward on the contents of the building. The *Paper Trade Journal* suggests two ways of getting around this. One is to set the end of the joist upon a corbel or projection from the face of the wall, so that the joists clears the face of the wall entirely, and in case it falls it exerts no influence upon the wall. The other method has the same object in view, and accomplishes it in a simpler way. The holes made to receive the joists are made about twice as high as the joists, so that in falling the joist has no prying effect upon the wall. These remarks apply to iron as well as wooden beams; but for iron beams there should be observed the additional precaution to leave a greater space between the end of the beam and the wall, so that the inevitable expansion of the beam from fire shall cause no thrust outward, tending to overthrow the walls. It would perhaps be as well if all external walls were held together by anchor bolts with external plates, which, although not very slightly, yet often tend to hold the wall up when otherwise it would topple and fall outwards. Of course, if the beams are properly cased below with some fireproof material or by some heatproof method, their expansion will be very much less than if they are left naked to the action of the heat.

THERE were received in Boston during the year 1880, 351,744,000 feet of lumber in all. Of this quantity about 209,400,000 feet was received by rail, 41,000,000 by sailing vessels from the south, 1,500,000 by southern steamers, about 100,000,000 by water from Maine and the British provinces.

TIMBER SLIDE COMPANIES.

The following Bill has been introduced in the Ontario Legislature by Attorney-General Mowat :—

1. This Act may be cited as "The Timber Slide Companies Act of 1881."

2. In case the Lieutenant-Governor in Council thinks fit, he may confer upon any company which has heretofore been, or shall be hereafter incorporated, under the Ontario Joint Stock Companies Letters Patent Act, for the purpose of acquiring or constructing and maintaining any dam, slide, pier, boom, or other work, necessary to facilitate the transmission of timber down any river or stream in this Province, or for the purpose of blasting rocks or dredging, or removing shoals or other impediments, or of otherwise improving the navigation of any such river or stream for the said purpose, the powers authorized by the Revised Statute respecting Joint Stock Companies, for the construction of works to facilitate the transmission of Timber down Rivers and Streams, being chapter one hundred and fifty three of the Revised Statutes.

3. Every company shall thereupon become subject to all the provisions of the said Revised Statute as amended by this Act, and to the provisions of this Act.

4. The letters patent conferring the powers authorized by this Act shall not be issued to any company until proof has been furnished that one-half of the proposed capital has been subscribed in good faith, and that at least ten per centum thereof (or five per centum of the whole capital) has been paid in to the credit of trustees for the company, and remains at their credit in some one or more of the chartered banks of this Province.

5. The applicants for a charter shall, with their application, transmit to the Provincial Secretary a report to be laid before the Commissioner of Public Works, in case the Provincial Secretary or other officer charged by the Lieutenant-Governor in Council with the duty of reporting thereon shall deem that the other requirements preliminary to the issue of the charter have been duly complied with, and shall also cause a copy of such report to be laid before the municipal council of the county in which such works are proposed to be situated ; or if the works are situate in more than one county, then before the municipal councils of the counties in or on the boundaries of which such works are proposed to be situated ; or if such proposed works are in unsurveyed lands not contained within the bounds of any incorporated county, then before the Commissioner of Public Works alone.

6. The Lieutenant-Governor may, in the Letters Patent, state a rate of dividend, not exceeding fifteen per centum, which the directors shall be at liberty to pay to the shareholders, if the revenues of the Company otherwise justify such payment, and in such case the Commissioner of Public Works, shall, in considering the tolls to be allowed, have regard to such rate, but no such rate shall be so fixed for a longer period than ten years.

7. The existence of any company incorporated under this Act may be limited to such a term of years as is fixed by the Letters Patent.

8. The notice of application in the *Gazette* need not state the objects of the company with the same detail as is required in the report, but shall give such a description thereof as will reasonably inform the public of the works to be undertaken.

9. The report shall contain :—

(1) A detailed description of the works to be undertaken, and an estimate of their cost ;

(2) An estimate from the best available sources of the quantity of different kinds of timber expected to come down the river or stream yearly after the works have been completed ; and

(3) A schedule of the tolls proposed to be collected.

10. Thirty days after the said report has been laid before the municipal council, or councils, as the case may be, the Commissioner of Public Works shall consider the said report, and in case he approves of the proposed work, he shall report such approval to the Lieutenant-Governor who may thereupon direct the issue of a charter.

11. Every such company may make by-laws, and from time to time alter and amend the same, for the purpose of regulating the safe and orderly transmission of timber over or through the works of the company, and the navigation therewith connected.

12. Copies of the proposed by-laws shall be annexed to the reports required to be made by the company by the fifth section of this Act, and such proposed by-laws with such variations as are made therein by the Commissioner of Public Works at any time before the issue of the Letters Patent, shall, upon issue of such Letters Patent, become the by-laws of the company without further action or adoption by the company, and copies of all new by-laws, and of all amended by-laws, with reference to the said subjects, shall be annexed to the annual report required by the twenty-seventh section of the said Revised Statute.

13. No such new by-law, or amended by-law, shall have any force until one month after it has been included in such report ; but if at the end of one month such by-law has not been disallowed as it may be by the Commissioner of Public Works, it shall have full force and be binding upon the oompany, and upon all persons using the works, unless the Commissioner in the meantime shall have under his hand enlarged the time for considering the same.

14. No such by-law shall impose any penalties, or shall contain anything contrary to the true meaning and intention of the said Revised Statute, chapter one hundred and fifty-three, of this Act.

15. No such company shall construct any such works over or upon or otherwise interfere with or injure any private property, or the property of the Crown, without first having obtained the consent of the owner, or occupier thereof, or of the Crown, except as hereinafter provided.

16. No such company shall be formed under the provisions of this Act to improve any river or stream, for the improvement of which any other company has been formed either under this Act, or any other Act of the Legislature, or upon which there is constructed any provincial work, without the consent of such other company or of the Lieutenant-Governor in Council respectively, which consent shall be formally expressed in writing, and shall be filed in the office of the Provincial Secretary

17. In all cases where a shareholder has not paid ten per centum on the share or shares held by him, but some other party pays the same on his behalf, the party so paying may recover the amount as a debt, in any competent court, although not previously authorized to pay the money on behalf of such shareholder.

18. Upon the expiration of the period limited for the existence of the company, if any such period is limited by the Letters Patent, all the dams, slides, piers, booms and other works constructed by the company, for the transmission of timber down any river or stream, or for the improvement of the navigation of such river or stream, shall become the property of Her Majesty for the public uses of the Province, and the said company, or the shareholders thereof shall have no right to receive any compensation therefor.

19. Notwithstanding the expiration of the said period, the said company shall continue to exist for the purpose of taking such proceedings as may be requisite for getting in its assets, winding up and settling its affairs, and distributing amongst its shareholders the capital stock or accumulated sinking fund of the said company, and the said company may, for the purposes aforesaid, sue and be sued as if the period of its corporate existence had not expired ; but after such period the words "in liquidation" shall be added to the name of the company, and shall be a part of such name.

20. No distribution of capital shall be made under the next preceding section until three years after the expiration of the said period limited as aforesaid for the existence of the said company, but this shall not prevent the distribution amongst the shareholders of the annual profits received from investments, and after the said period the fifty-seventh section of the said Joint Stock Companies' Letters Patent Act shall not apply to the company.

21. The fifty-seventh section of the said Revised Statute, chapter one hundred and fifty-three, is hereby amended by inserting after the word "works," in the eleventh line thereof, the following words :—"and running, driving, booming, towing, sorting, and rafting logs and other timber, and providing an equal annual sinking fund, which, invested at six per centum, shall be sufficient to pay back to the shareholders the amount of their paid-up stock at the end of the time limited for the existence of the company," and by substituting "fifteen dollars" for "ten dollars" where these words occur in the thirteenth, seventeenth, and nineteen lines of the said section.

22. The seventy-second section of the said Revised Statute is hereby amended by inserting after the words "undertaken by them" the following words :—"and mentioned in the report required prior to the incorporation of the company ;" and by inserting after the word "situate," in the ninth line thereof, the following words :—"or by the Commissioner of Public Works."

23. The seventy-third section of the said Revised Statute is hereby amended by inserting after the word "damage," in the thirteenth line thereof, the following words :—"incurred after the time limited for the existence of the company has expired, or."

24. The seventy-fifth section of the said Revised Statute is amended by adding at the end thereof the following words :—"and in settling the amount to be paid to the company for such works, the amount of the sinking fund accumulated at the time of such valuation towards the payment of the capital stock shall be deducted therefrom."

25. Where a company heretofore incorporated under the said Revised Statute, chapter one hundred and fifty-three, or under the Consolidated Statute of Canada, chapter sixty-eight, applies for the issue of letters patent under section sixty-five or section sixty-six of the Ontario Joint Stock Companies' Letters Patent Act, the Lieutenant-Governor may, by the letters patent, confer upon the said company any of the powers authorized by this Act, and may by such letters patent limit the term of existence of the said company, and every such company obtaining letters patent as aforesaid, shall be subject to the provisions of the said Revised Statute, chapter one hundred and fifty-three, as amended by this Act, and to the provisions of this Act.

26. The Lieutenant-Governor may by Supplementary Letters Patent extend the term of existence of any company incorporated for a limited period under this Act, for such a number of years, as by order in Council made previous to the expiry of such period he may direct, and the provisions of this Act having regard to the expiration of the term of existence of a company shall thereupon apply to such term as so extended.

27. Sections—and—of this Act, shall not apply to any company heretofore incorporated, unless and until such company becomes re-incorporated under the said sixty-fifth section of the Ontario Joint Stock Companies' Letters Patent Act.

28. The first twenty-six sections, and also sections numbered from twenty-nine to forty inclusive, of the said Revised Statute respecting Joint Stock Companies for the construction of works to facilitate the transmission of timber down rivers and streams, are hereby repealed, except as to companies heretofore incorporated under the said Act.

TAMARACK vs. OAK.

Experience has shown, says an exchange, that in breaking up old steamboats, the softer tamarack wood will cling to the iron fastening with more tenacity than will the harder oak. If we endeavor to separate the two, we find it easier to drift the iron from the oaken frame than the tamarack knees. When a bolt is driven into hard timber, like oak, the elastic compression of the wood is not nearly so great as in more spongy timber, and where the latter endeavoring to assume its normal condition, hugs the iron more closely, the former retains its compression, and it is no extraordinary occurrence that for a time the bolt is comparatively lose in the hole. With oxidization of the iron, however, the bolt becomes cemented in the wood and is firm, the acid juices of the oak often eating away the iron, when it requires no great strain from the wrenching which a ship will get in a seaway to cause the rust shell to give way and the bolt to draw. When a bolt is driven through a tamarack knee into a ship's frame of oak, we expect the bolt to draw first from the oak, and if we desire to use the knee again, would consider ourselves fortunate if we could draw the bolt from it. If we did succeed, we should expect to find the bolt in the knee comparatively sound, while that in the oak was badly corroded. The same principle is seen in the driving of piles, which will hold better in quicksand than in clay, the loose soil accommodating itself to an easy driving, but closing about the stick with a suction which almost wholly prevents its withdrawal.

NEW USE FOR SAWDUST.

The *Lumberman* says : We have been shown a model of a car wheel consisting of an iron rim of seven inches outward diameter by one-half inch thick, fitted with a well-proportioned hub, the space between the hub and rim filled with pine sawdust, pressed in so solidly that we are ready to believe the assertion that resting the iron rim upon bearings, a pressure equal to 23 tons applied to the hub failed to develop any signs of weakness. We hesitate in these days of progress to assert that anything is impossible, and we begin to think that even sawdust possesses elements of value hitherto unsuspected, and that the day may come when the filled grounds adjacent to all sawmills may be seen to have a great value in the mechanical development and utilization of the now useless *debris* placed upon them to get it out of the way. Sawdust car wheels, sawdust brick, sawdust fence posts, railroad ties, and even sawdust window and door frames, wainscoting and mouldings, begin to appear among the possibilities of the immediate future.

MIDLAND LUMBER SUPPLY.

THE following is the stock on hand of lumber and the estimated cut of 1881 in the district served by the Midland Railway :—

Manufacturer.	*Place.*	*Stock on hand.*	*Cut of 1881.*	*Total.*
British Canadian Lumbering & Timber Co.	Midland	6,750,000	21,250,000	28,000,000

ALBANY INSPECTION.

This was originally divided into five qualities, viz.: Clear, Fourths, Box or Selects, Common and Culls, Clear, or Three Uppers, was subdivided into three grades: First, Second, and Third.

First Grade.—A First Clear board shall be perfect in all respects, free from wane, knot, rot, shake or check, not less than twelve feet long and eight inches wide, (in any case) unless a very wide and thick piece, when a minimum length of ten feet may be allowed.

Second Grade.—Not less than twelve feet in length, unless very wide and thick with not more than two defects, *i. e.*, two sound knots which could be covered by a York shilling (dime), or sap equal to one inch on one side, or one knot and one sap; not less than ten inches wide, well manufactured, and free from rot, shake or check.

Third Grade.—Not less than twelve feet long, unless very wide and thick, and ten inches wide, free from rot, shake or check, when three defects might be allowed; either three knots which a York shilling would cover, or two saps an inch wide, with one small knot. If very wide, the defects might be allowed slightly to increase, but not so as to injure the general character of the piece. These three grades are included in one and designated Clear or Good.

Fourths.—Not less than twelve feet long and twelve inches wide, with not exceeding four defects at that width, viz.: if free from sap, four sound knots on the heart side, not larger than a dime; if free from knots, two saps which must not exceed two inches on each edge, and must be bright. At the minimum width, one face must be perfect; with increasing width latitude may be allowed to the extent of the sap.

*Select Box.**—Not less than twelve feet in length and eight inches in width in any case. Must, if narrow, have one perfect face, and may have small knots, not exceeding five, in a width of fourteen inches or more. Sap may meet on one end for not more than one-fifth the length, or two saps may be allowed on sap side, but must have at least three inches of heartwood between; sap must be bright; must be free from rot, shakes and checks.

Box or Common.—All sound lumber free from loose knots, shaky hearts, rot, shake and worm holes, which is below the grades before named shall be classed as Box or Common.

Pickings.—A grade of common which in its general character will dress one side clear, or has no great number of small knots, but is suitable for finishing lumber. (A mighty good fine common, but indifferent select.)

Culls.—Will not hold water, shaky, rotten, coarse knots, black and mouldy sap. If very rotten, embracing more than one-eighth of the board, it becomes a scoot, refuse or mill cull. Market culls must be good enough to make hog pens, board fences or roof boards.

Scoots, Refuse or Mill Culls.—Lumber that is not worth removing from the mill, and is fit only to be burned.

*In the early days of the trade, the grade Select was known as Box, while Sound Common was known as Merchantable.

Remarkable Locomotive Explosion.

On the night of the 23rd of January 1881, a freight engine on the Philadelphia and Reading road was sent out from Palo Alto, Pa., to bring in a train of loaded coal cars from a siding. An hour later the engine was found a mile beyond the siding with all the crew—engineer, conductor, and two brakemen—dead and terribly mutilated. The boiler had exploded, tearing the engine to pieces and killing all the men As the explosion occurred in a very lonely place and all the men were killed, no details are known.—*Railway Gazette.*

Wood Freights.

The London *Shipping and Mercantile Gazette*, of February 24th, says: Three Rivers to Liverpool, 65s.; Quebec to London, 62s. 6d.; Shediac or Miramichi to direct United Kingdom or French Atlantic port, 60s.; Saguenay or Mills, River St. Lawrence, to direct port United Kingdom, 57s. 6d.; Richibucto to direct port W. C., 62s. 6d.; Nova Scotia ports to direct W. C. port, 57s. 6d. A sailing ship has been chartered in the Mersey to load timber at Quebec for Limerick at 26s.

LIVERPOOL.

Though our business has continued quiet, there has been a visible increase in the quantity of orders in the market, though they have been more numerous than large. Of course there is nothing doing in the mining districts, where all trade is standing still, and is likely to continue so until the disputes between the miners and the proprietors are settled. This, however, does not appear near at hand, and the whole district is in a more or less disturbed state; and so long as this condition lasts there is little chance of any business being done in this quarter. This will materially affect the Norwegian pitwood trade, and should act as a check upon the exporters, seeing that it is by no means unlikely that the strike will extend far beyond its present boundaries.

Producers of Norwegian goods are apparently ready sellers, especially of flooring, which is being pressed upon the market at lower prices than those current last year, but buyers are somewhat reticent in making purchases, after the experience of last year, when contracts were made early in the season at good prices, and other cargoes were subsequently shipped upon the open market, to find a purchaser at any price. The season of import for New Brunswick deals, etc., is now about over, and prices have dropped until they cannot be expected to go lower, as all the yarded stock of the port has been imported at higher rates than those now current. At the same time producers abroad must be prepared to suffer a still further reduction if they persist, in the face of the large stocks here and in other ports, in getting out large quantities of logs for deal-cutting.

There is little doubt that at the present time the stocks of deals in the shipping ports of New Brunswick and Nova Scotia are moderate, but that fact should have very little weight with shippers when they fully appreciate the fact that the stocks are heavy here, and must be worked down considerably before they can hope to get paying prices again.

Freights will, in all probability, rule low for the opening of the navigation, both for the deal-producing ports and Quebec. For the latter we hear that about 24s. is the prevailing idea, as the rate offering to Liverpool; this will leave little, if any, margin of profit to the shipowner. The common qualities of yellow pine timber, say from good fair average and downwards, are becoming year by year much less valuable than they were formerly, owing to the competition they meet with in pitch pine, as the latter can be obtained, not only of longer lengths and better sizes, even in sawn timber, but, what is now-a-days of greater importance, at a much lower rate than is asked for the Canadian production.

A large proportion of the stock on hand consists of this description, and it appears most difficult to sell. We cannot help thinking that the Canadians are putting far too high a value upon their productions, especially for the medium and lower qualities of pine timber and deals, and in fact of nearly all their timber, when not of really first-class quality.

LIVERPOOL TIMBER SALES,

On the 11th Feb. Messrs. Alfred Dobell & Co. offered a cargo of Norway spars, poles, etc., which realized fair prices, viz.:—

Masts, 6½ in. diameter, 12d. per cubic foot.
Spars, 4 to 6 in. diameter, 1⅝d. to 1½d. per lineal ft.
Poles, 30 ft. long and upwards, 1⅝d. per lineal ft.
" 29 ft. and under, 1d. per lineal ft.

On the same day Messrs Duncan, Ewing & Co., sold a parcel of 724 logs St. John birch timber, as under:—

13½	to 14½ in.,	14½d.	per ft.
14½	" 15 "	14½d.	"
15	" 15½ "	14⅝d.	"
16	" 16½ "	15½d.	"
17½	" 18 "	16½d. to 18d.	per ft.
18	" 18½ "	17½d. " 18½d.	"
19	" 20 "	19d " 23½d.	"
Maple, plain,		15½d.	per ft.
Ash,	"	18½d.	"

The Advantages of Sawdust as a Filtering Material.

On the 27th ult. Mr. Henry Chapman read a paper before the Institution of Mechanical Engineers on the Farquhar Filtering Apparatus, in the course of which he remarked that, in addition to water and sewage, this automatic self-cleansing process may be expected to effect a revolution in all kinds of filtration, and will prove of great benefit to sugar-makers, distillers, brewers, vinegar-makers, and others who require pure, rapid, continuous, and economic filtration. It entirely supersedes and dispenses with the use of cloths or bags, which entail a considerable annual outlay, and which do not produce an average pure filtration. For brewers and distillers it would be specially useful in filtering the refuse, which at present contains a very large amount of good liquid that is practically wasted owing to the inability of any existing system to filter it continuously.

Taking bulk for bulk it has been found that the following great advantages are in favour of sawdust and against sand, &c. :—

1. It is a cheaper commodity.
2. Its cost of conveyance is not a serious item as it is with sand.
3. Much less manual labour is required in washing sawdust, chiefly on account of its lightness and portability,
4. It produces far purer filtration, because the grains of sawdust, when saturated, pack closely together, and the greater the pressure employed the tighter the grains become knit together, which cannot take place with sand.
5. More than three times the volume of liquid is filtered in a given time through sawdust than through the same bulk of fine sand by this process. The reason is that the solid impurities are arrested immediately on the top surface of the sawdust, and are therefore instantly removed by the cutter, so that rapid and continuous filtration ensues; whereas with sand the impurities always penetrate some distance below the top surface, owing to the impossibility of making grains of sand pack close enough together, even under great pressure. In fact, the grains of sawdust tightly overclap each other under pressure being thus equivalent to a number of pressed layers of fine cloths or blotting paper, and the sawdust bed is thus impervious to anything but pure liquid.

The question naturally arises whether sawdust imparts any flavour to the filtered liquid, which with sugar, &c., might be a disadvantage. The answer is that, after the liquid with which the sawdust has been saturated previous to filtration has been expelled, no flavour from the sawdust can be detected in the filtered liquid. The reason is that the liquid with which the sawdust was saturated is thoroughly absorbed into the loose grains of the sawdust like a sponge, and that the whole of this liquid is, under pressure, squeezed out of the grains, carrying with it the greater part of the flavour in the sawdust. The sawdust being then in a compressed state, the filtered liquid is prevented from entering into the interior of the grains, and in its rapid passage between the grains it does not carry with it any flavour therefrom.

In all cases the sawdust must be saturated with some clear liquid prior to making the filter-bed, in order to create capillary attraction equally in all directions, so that the filtered liquid shall flow equally through the whole of the bed.

Repeated tests have been made to ascertain if the liquid to be filtered drives before it the whole of the liquid used in the saturation of the bed prior to filtration. This has always been proved to be the case, by the following test. The amount of water used in saturating the bed has been carefully measured. So soon as this quantity had been extracted, and not till then, did the filtered sewage, or sugar juice, &c., pass out of the machine.

Experiment with Gate Posts.

Fourteen years ago a Mr. Sterling, of Monroe, Michigan, placed two gate posts of white oak in front of his residence. When they were set he bored into the top of each with an inch and a half auger a hole three inches deep, filled it with common salt, tightly plugged it, and coppered the posts. Having occasion recently to change the location of the posts, he found them as sound from top to bottom as the day they were planted.

Exhausting the Pine Forests.

The Chicago Lumbermen's Exchange held its annual meeting in that city on Monday, March 7th. The President's address contains the startling statement that it will take only twenty years to exhaust the great pine forests of the country if the present rate of depletion continues. The receipts of lumber of all kinds at this port last year were 1,564,000,000 feet.

MIDWINTER MALARIA.

The last number of the *Scientific American* contains the following sensible sanitary advice which should be read by all classes:—

From some cause or combination of causes the present winter has been remarkable for a widely extended and marked increase in diphtheria and scarlet fever, which have invaded homes in which the highest attainable skill has been exercised and the most approved appliances have been employed to render them as healthy as possible. In some cases the immediate causes of these disorders are undiscoverable, but in the light of sanitary science the class of agents which either initiate or greatly increase the virulence of these complaints is no longer problematical. Decaying organic matters, more particularly animal excretions, give rise to a subtle blood poison, which, though it yet evades chemical analysis, is now conceded on all hands to be a positive deadly fact. When this poison invades a dwelling, no matter whether from exterior or interior sources, in sufficient quantity, the lives of the inmates are jeopardized as positively as though they were compelled to breathe a mephitic gas. The effect may not be so prompt or fatal, but the danger is a fact no longer disputed by any intelligent physician.

It is, therefore, not sufficient to guard against interior sources of diseases; the peril may be in a neighbor's house or outbuildings, in the emanations of a compost heap or a filthy street or hidden cesspool, which if they find an avenue may enter sleeping apartments, find a *nidus* in clothing, carpets, and drapery, and bring in their train the swift destruction of all that is most cherished.

A case in point has occurred in a neighboring village. Five cases of diphtheria appeared in a household where the utmost care had been taken with the plumbing. The obvious inference was that the causes of the complaint were exterior to the dwelling. It was found that the mouth of the air-box through which exterior air entered to supply the heating furnaces was on a level with the top of a cemented pit on the adjoining premises, in which accumulations of kitchen refuse, animal, vegetable and barn manure were promiscuously stored and allowed to rot for fertilizing purposes. The foul air from this pit was drawn into the house through this one avenue, and the poisoning of its unfortunate inhabitants, four of whom died in quick succession, was the result. It seems that disease may prevade a house with deadly result where the cause is least suspected; it therefore devolves upon every housekeeper, whether resident of the city, village, or on a farm, to be constantly watchful, not only of his own, but also of his neighbor's premises, that none of the obvious causes of disease be permitted.

New Method of Inlaying Wood.

A new method of inlaying wood has been contrived by a furniture manufacturing house, the process of which is as follows:—A veneer of the same wood as that of which the design to be inlaid consists—say sycamore—is glued entirely over the surface of any hard wood, such as American walnut, and allowed to dry thoroughly. The design is then cut out of a zinc plate about one-twentieth of an inch in thickness, and placed upon the veneer. The whole is now subjected to the action of steam, and made to travel between two powerful cast-iron rollers of 8 inches in diameter, by 2 feet long, two above and two below, which may be brought within any distance of each other by screws. The enormous pressure to which the zinc plate is subjected forces it completely into the veneer, and the veneer into the solid wood beneath it, while the zinc curls up out of the matrix it has thus formed, and comes away easily. All that now remains to be done is to plane down the veneer left untouched by the zinc until a thin shaving is taken off the portion forced into the walnut, when, the surface being perfectly smooth, the operation will be completed. It might be supposed that the result of this forcible compression of the two woods would leave a ragged edge, but this is not the case, the joint being so singularly perfect as to be unappreciable to the touch: indeed, the inlaid wood fits more accurately than by the process of fitting, matching, and filling up with glue, as is practised in the ordinary mode of inlaying.

Trade Notes.

Canadian.

THE outlook for building operations in Montreal during the coming summer is unusually bright.

IT is stated that thousands of tons of ore are ready for shipment at Kingston as soon as navigation opens.

On the 2nd inst., twenty-five men left Eganville for up the Bonnechere, to work on Barnet & Mackay's drive, when it commences.

THE new mill about to be put in operation by the Messrs. Gilmour, at Trenton, will give employment to about 200 men, in addition to the large force already employed by them.

THE Augur shipping company of Montreal, which already owns fifteen barges and two steamers, suitable for the Ottawa lumber trade, are negotiating for the purchase of two new barges with a capacity of 250,000 feet each.

Mr. D. R. MacLeod, of Quebec, bought recently the spruce deals to be cut at Montmorenci mills this year for Messrs. Bryant, Powis & Bryant, who recently purchased the pine deals referred to a few days since. Large purchases have also been made by a Quebec firm of spruce deals at Cap St. Ignace and river Ouelle. The prices are not yet known, but are understood to fully sustain recent quotations.—*Industrial World.*

Mr. W. J. Macaulay, formerly of Winnipeg, is erecting a new saw-mill at Keewatin, near that already erected by the Keewatin Lumber Company. It will have a capacity of eight million feet. By making a cut about 275 feet in length from the Lake of the Woods across a ridge to a pond, a head of 17 feet of water is obtained. Mr. Macaulay had 75 men at work in the woods this winter and will take out about four million feet.

THE Windsor *Mail* says:—"We hear that a stock company of about $200,000 capital is talked of in Windsor, for the purpose of manufacturing agricultural implements. As the sale of these goods is large, and always on the increase, we have no doubt of the success of the undertaking. We have heard it stated that at least $150,000 worth of agricultural implements have been sold in nova Scotia in one year, and there is no reason why such a large amount of money should not remain in the province. We look anxiously for further developments."

THE Perth *Expositor* says:—B. Caldwell & Son will cut 100,000 feet of square timber in the township of Canonto, Frontenac county, to be sent down the Madawaska. They did not cut last season. Hilliard & Dickson, of the same locality, will take out about the same amount. B. Caldwell & Son will cut 400,000 feet of square timber, to 150,000 last season. The yield of sawn lumber on the Mississippi will be from twenty to twenty-five million feet, about the same quantity as last season. On the Clyde, in Levant township, county of Lanark, B. Caldwell & Son will cut about 200,000 square feet of timber.

American.

EXPERIENCED lumbermen concede, says the *Lumberman's Gazette*, that this winter's log cut in Wisconsin will not exceed that of last season.

A STEAM mill, 40x128 feet, containing, besides other machinery, a rotary, for long timber, and eight shingle mills, is nearly completed at Van Buren, Me.

Lumber rates from Stevens' Point are as follows: To Missouri river points, $78.20; to East St. Louis, $61.20; to St. Paul and Minneapolis, $36.00; to Milwaukee, $29.00. This is per car load of 24,000 pounds.

The Stillwater (Minn.) *Gazette* says: It is claimed on good authority that the lumber orop for the present year will not be as large in proportion to the number of men employed as was that of last season. The reason is said to be too much dry snow, which makes hauling hard.

FIVE new glass works were started in Ohio last year, and several more will be added this year. The latest official statistics give 19 firms engaged in glass manufacture, with 32 furnaces, having 292 pots, and employing 2,032 men. In the production of window glass there are employed seven furnaces with 66 pots; flint glass, 19 furnaces with 199 pots; green glass, four furnaces with 27 pots.

The Clearfield (Penn.) County *Times* is moved to say: That there will be more timber put into the river, and if possible got to market, this season than for several years, is now disputed. The indications now are that the demand will be up to the supply, at least so far as the product of this region goes. The present outlook has ample time to change, however, during the next 60 days, and lumbermen who fail to get down on the first floods may get caught in a reduction of price caused by a glut in the lumber market.

THE value of Erie canal tonnage last year was $200,000,000. The wheat acreage of the west, which principally made this business, was more than 2,500,000 acres more than in 1879, and a like increase of acreage is expected this year. Although the paid tolls on the canal of $113,000 a year were abolished, the toll receipts have leaped up to nearly $300,000. The cost of keeping up the canal is nearly $900,000, and the revenues last year were $1,200,000, making a surplus of over $300,000. Before the State of New York discriminated in favor of the canals their business had run down 600,000 tons in twelve months; and since that liberalizing of rates the canals do 2,000,000 tons more business, and there has been a consequent lowering of tolls on the railroads. The Erie canal is almost the only corrective agency of high grain freights from the west.—*American Exchange.*

The Bangor (Me.) *Commercial* gives place to the following: Last fall, when lumber was bringing a good price, it was thought that with the coming winter there would be a general rush for the woods, and that every man who could haul a log on the rollway would do so. Others predicted that in consequence of the immense cut, lumber would sell at ruinous prices in the spring, and many of the operators would suffer financially. This may be partially true as regards the Penobscot, but on the Upper St. John it is wide of the mark, for it is estimated that the amount of logs cut on the Aroostook, Tobique and the small streams in their vicinity will not exceed 25,000,000 feet. Then, again, it is a poor way to figure the supply at market next year from the cut in the woods, for the drives may be hung up, as they often have been, and possibly, leave a not over large supply available.

British.

The deliveries at the Surrey Commercial Docks were very heavy last week, consisting of no less than 5,249 standards of sawn wood and 73,800 feet of timber, as against 4,165 standards and 38,200 feet respectively during the corresponding week of last year. The total quantity, however, for the five weeks is still very much below the figures of 1880.

The importation last year into the United Kingdom, without taking into account staves or mahogany, consisted of 310,338,900 cubic ft. of hewn and sawn wood, or nearly 3,725,000,000 super ft. To form an idea of this stupendous quantity, it may be mentioned that there would be a sufficient number of blocks 1 ft. cube, if placed end to end, to stretch a girdle twice round the earth, and leave almost a sufficient number over to extend through the centre of it.

Liverpool seems to have been very much overcharged with imported wood towards the end of last season. Messrs. Coltart & Co. placed the excess at 45 per cent. over the previous year, but Messrs. Farnworth & Co. reckon it to be 53 per cent. in their circular of 31st January, noticed in our last, and state that the stock on hand is greater now by 13 per cent. than the average of the last seven years.

The sum of the whole matter is that the prospects of trade are very good, but the timber market is in that kind of sensitive state which would be likely to render speculative importation a very risky experiment. Things may go down, but there is at present no indication of a rise.

Quotations are being made, it is said, for Quebec yellow pine at £17 10s. for 1st, £11 10s. for 2nd, and £6 for 3rd, per Petersburg standard, free on board. For spruce, St. John and Miramichi shipment, £4 10s. is, we believe, asked; while for Riga goods the figures are put down at £7 for full 11 in. crown, although a little time back £7 5s. was asked, and for 3x9 and 3x10½ to 11 £6 10s. to £6.15s. free on board. —*Timber Trades Journal.*

BRITISH AND AMERICAN TRADE WITH CANADA.

The trade and navigation returns for the Dominion of Canada, which were made up for the past fiscal year and laid on the table of the House of Commons at Ottawa on the 27th of January last, are quite as favorable as our own, and show an increasing trade with the mother country, in comparison of that with other nations, which it is very pleasant to see.

Our friends out there are fond of exciting our apprehensions by threatening to let the United States have all their timber (more than half, they generally tell us, is already set apart for them), if we do not relax our purse-strings and pay better prices than we are accustomed to do for their staple articles of wood traffic, pine and spruce, which have been getting very scarce (on paper) for the past ten years, but in reality pouring into this country faster and at a cheaper rate the last year or two than ever before.

But in point of fact these returns reveal to us by the test of figures that the United States, so far from superseding the British demand by their requirements from Canada, do not by any means keep pace with us. It was easily proved from the Custom House returns of the entries and clearances at Quebec, Montreal, and the Saguenay, that the deliveries by sea to the United States ports bore no sort of comparison to those for the United Kingdom. but there was always the traffic across the river and by the lakes to fill the imagination of buyers on this side of the Atlantic with untold millions of loads making their exit from the Dominion by routes of which the ports of entry on the St. Lawrence took no note. But the trade returns of a country grasp the statistics of the business done at every outlet or inlet of the Dominion, and by those now before us we are enabled to compare the respective values of their American and their British trade, as they really stand, to the people of Canada.

The total value of the exports of the Dominion last year was only twice exceeded since its Confederation, and that was in the wildly speculative years 1873 and 1874, when everybody thought they were on the high road to prosperity because, whatever price goods sold for during the first of those years, the buyer was willing to contract for similar goods at some advance for the year following; such at least was the case with the timber trade, till 1875 came and dispelled the illusion. However, not only has the trade again resumed the activity of its best days, but the exports last year from the Dominion, for the first time in its history, exceeded the value of the imports, which means just this, that in a national point of view it is taking more money than it is spending, and therefore doing its trade at a good profit.

The amount of the excess over the imports was $1,421,711, and over the goods entered for consumption $1,612,910. The total receipts from import and export duties collected at the Custom Houses were $14,138,849, and the aggregate trade of the Dominion shows an increase in business done with the United Kingdom over that of the previous year (1879) $13,018,438, and a decrease in that with the United States of America $8,207,863, than which we require no better evidence of the increasing importance to Canada of its British trade in comparison with that of the United States, the difference being in favor of this country by nearly four and a quarter millions sterling. These statistics are worth recording for future reference as often as we are admonished that the United States are going to buy up all our Canadian timber, as they are earnestly entreated to do in self-defence by those writers who, while preaching an impending timber famine, are not indisposed to do a lively business with what remains of the depleted forests, whose extinction, while they predict, they appear so feelingly to lament. After this, we can look without blinking at the forebodings of the coming year; and there is a paragraph in the circular of Messrs. Guy, Bevan & Co., of St. John, N.B., and Miramichi, which bears immediately on the question. After letting us know that the stock of spruce at St. John is only 27,000,000 ft. super, as compared with 79,000,000 the year before, we have the following warning:—

"The large and increasing demand for these in the United States is likely to prevent several mills, which have lately been cutting for the English market, from doing so any longer."

This would be rather alarming if we had not heard the same kind of report with slight variations before, but we require to be told a little more before attaching much importance to the stock on hand at any depot on the opening of the season. Sweden taught us a serious lesson on this particular point of the trade last year. They proved to us, and Englishmen going over there to see for themselves admitted to a certain extent the evidence of it, that the stocks on hand were much shorter than usual to begin the season with, and to remove any expectation that these small stocks were likely to be replenished during the season they remorselessly dried up their rivers in every direction, as far as it was possible for pens and ink to do it. Nevertheless, we never had such a plentiful supply from that country, which began earlier and lasted longer than usual, but not without water floatage, as appears to have been done last year in Sweden. Our Chicago correspondent add the following:—

"The amount already banked probably approximates pretty closely to 50 per cent. of the entire crop, or at least that part of it which it is customary to put in during the winter. Summer operations have become so common now that they are relied upon by many mill-owners to make up any deficiency in their stock, or to increase it if the development of the season makes it desirable to saw more lumber than they intended."

By this little piece of information the eyes of the importers at home should be pretty considerably opened. The year's supply is not, it seems, governed in any way by the quantity of stock on hand at the opening of the season. That may be large or small as it suits the convenience of shippers to lay it in. Last year during the winter great expectations were entertained by shippers, and they bought up all the stock they could in anticipation of a rise in price at the fountain-head; this year they are not quite so sanguine, after filling up to the brim most of their European channels of demand, and they wisely refrain from encumbering themselves with heavy stocks, as there is no apprehension of any scarcity, or any increase of price. We now can fully comprehend the situation. The stocks abroad at the shipping ports are evidently proportioned to the expected demand. The heavy supply in the interior, like the *poste restante*, must wait till called for. —*Timber Trades Journal.*

Responsibility of Employers.

While a boy of 16 was at work upon a printing press in the press room of a New York paper the press was unexpectedly started. The boy sprang back from his perilous position, and in so doing tipped over the bench he was standing on, causing him to fall against another press, which caught his arm and injured it so as to make it forever useless. He sued the proprietor in the superior court and obtained a verdict for $3,000 damages. The defence was that the accident was caused either by the negligence of the plaintiff or of a fellow workmen, for which the proprietor was not responsible. In charging the jury, Judge Speir said that if the plaintiff or a skilled fellow workman were negligent the plaintiff could not recover damages; but that if the defendant employed persons not skilled in their work and the accident occured through the negligence of one of such persons, the defendant was responsible. An appeal was taken from the judgment on the grounds that Judge Speir erred in thus charging, and in permitting the plaintiff to exhibit his mutilated arm to the view of the jury, thus arousing their sympathy. The general term has affirmed the judgment in a long opinion written by Judge Freedman and concurred in by Chief Justice Sedgwick.

THE Green Bay *Advocate* says there has probably never been so large an amount of products of our northern forests gotten out and shipped in any winter before as this, particularly cedar posts, railroad ties, and telegraph poles, large quantities of which have been put on the track. Much timber killed by fire has been utilized in this way. There has also been a large amount of cordwood and tan bark gotten out.

CARELESS SAWING AND PILING.

In the report of the Agricultural Commission just issued, we find the following with reference to the proper manufacture and piling of hardwood lumber :—

"One of the greatest drawbacks to the hardwood timber business is the difficulty experienced in getting the lumber properly manufactured. While there are many mills distributed throughout the Province, very few of the sawmill men seem to know, or if they do, don't care, how they cut their lumber. In most cases they will cut the logs through and through, thus leaving the heart in the lumber and often one or more inches of bark on one side, besides making the boards of uneven thickness. When they measure such lumber they do so on the wide side, and make no allowance for heart lumber. This is the source of great trouble to the purchasers, as when properly measured there is a great difference, even in a few thousand feet. All hardwood lumber should be cut free from hearts and shakes, and, when cutting, the logs should be turned so as to make the lumber as clear as possible, as a piece of good lumber, either inch or thicker, six or eight inches wide, is worth far more than one twice the width with a heart or shake in the centre or on one edge ; further, it should all be cut uniform in thickness and parallel width, and also square edged. Then, again, a great loss is occasioned by improper piling of the lumber, as often good lumber is completely spoiled and rendered worthless from the way in which it is piled. The piles should be started on firm foundations laid north and south, as lumber piled in these directions prevents the hot summer sun from splitting the ends. Each length and thickness should be piled separately, and, except in long lengths, should only have two cross pieces ; in lumber twelve to fourteen feet long, these should be about nine feet apart. The pile should have a slope of about six inches. This can be done by placing the back stringer six inches lower than the front. This fall causes the rain to run off. The front piling strip should be put across at the very end, or even a little past the end, and each board or plank should come a little forward of the one below it. The piling strips should be over each other, or rather a little in front. For instance, a pile twenty feet high should overhang say two feet, and a straight-edge put up on the front of the pile should touch all the front cross pieces, and not touch the ends of the lnmber. The lumber should not be allowed to remain uncovered, but should, as soon as piled, be covered with culls or cheap lumber. The ends of the covering-boards should extend over the front and rear, and be tied down or have heavy pieces of timber thrown on the top to keep the wind from blowing them away. The piles should be finished as quickly as possible.

If sawmill men would only attend to the above instructions they would get from one to three dollars per thousand feet more for their lumber.

BRITISH TIMBER TRADE, 1880.

An exhaustive review of the trade for 1880 is made by the London *Timber Trades Journal* of January 22nd, from which the following interesting particulars are compiled, attention being directed mainly to American stock sold in the various marts of the kingdom :

The total supply of foreign timber to the United Kingdom, exclusive of staves and furniture woods, for two years past was as follows, with the countries furnishing it, a "load" being 50 cubic feet :

	1879. *Loads.*	*1880.* *Loads.*
Norway and Sweden, hewn	436,653	658,881
Norway and Sweden, sawn	1,406,630	1,608,210
Russia, hewn	174,898	336,649
" sawn	723,609	1,060,608
Germany, hewn	200,911	277,579
British North America, hewn	194,431	360,622
" " sawn	904,589	1,147,040
Other countries, hewn	369,322	486,145
" " sawn	218,584	271,055
Total	4,731,527	6,206,778

The total supply of 1874 was 6,252,641 loads ; 1875, 4,985,769 loads ; in 1876, 6,260,913 loads ; in 1877, 6,665, 361 loads ; in 1878, 5,299,901 loads. Reduced to inch boards the superficial measurement of the supply of 1880 would be about 3,103,389,000 feet.

The importation from Canada to London last year was : Yellow pine deals, 1,805,000 pieces ; spruce deals 2,977,000 pieces ; yellow pine timber 4,357 loads ; red pine 992 loads ; elm 1,991 loads ; ash 2,719 loads ; hickory 311 loads ; ash 3,738 loads ; birch 8,617 loads.

As compared with the importation of 1879, there was a decrease last year of 289,000 pieces of pine deals and 345,000 pieces of spruce deals ; there was an increase in yellow pine timber of 1,603 loads, of oak 1,137, and of birch 5,357 loads.

In 1878 the tonnage employed in bringing cargoes of timber, deals, and other wood goods into Liverpool and Birkenhead was 373,000 tons in 1879, 326,000 tons, and in 1880 about 485,000 tons, or an increase of 28 per cent. over 1878, and 37 per cent. over 1879. Of this 485,000 tons, about 122,000 tons have been vessels engaged in the Quebec and Montreal trade, 102,000 tons from St. John, N.B., 110,000 tons from Nova Scotian ports, 96,000 tons from the Baltic and White Sea, and 55,000 tons from the pitch pine ports, and if we add the tonnage of the vessels bringing teak, greenheart, and mahogany, which have not been taken into account in the above, the total may be set down in round numbers at 500,000 tons.

The imports from Canada of yellow pine timber in 1880 were 47,800 logs, against 25,200 in 1879, and 25,100 in 1878, and from St. John, N.B., and the Lower Gulf ports, 6,100 in 1880, against 3,100 in 1879, and 3,100 in 1878. Of pine deals, 1,660,000 pieces in 1880, against 1,064,000 pieces in 1879, and 1,001,000 pieces in 1878, show a very large increase in this description of goods, which appear to be growing more in favor year by year. The increase in the quantity of deals from New Brunswiok and other ports, chiefly spruce, is shown as follows : In 1860, 6,289,000 pieces, against 4,735,000 pieces in 1879, and 5,896,000 pieces in 1880, which may be estimated as being 87,500 Petersburg standards in 1880, 65,700 in 1879, and 81,800 in 1878.

Canadian goods have not varied much in prices during the past season, save pine deals, which gave way to the extent of 10s. to 15s. per standard during the first part of the import season, owing to the consignment of parcels of low qualities and generally poor specifications, but regular sizes and good qualities have throughout the year been very steady. This has also been the case with prime timber, but fair average and common qualities have been sold at prices under cost of importation.

The import of pitch pine has been, like most other woods, in excess of last year, being about 59,000 logs, against 40,000 logs in 1879. But as there has been throughout a very lively consumption of this favorite timber, our stocks, as will be seen from the table, are moderate. Prices during the year have been high, and, although they have slightly receded here lately, the rates asked abroad are very firm.

	Stock for Dec. 31, 1880, ft.	*Year end'g Dec. 31, 1879. ft.*
Quebec square pine	869,000	534,000
" waney board	303,000	301,000
St. John pine	21,000	23,000
Other ports pine	43,000	18,000
Pitch pine, hewn	394,000	273,000
" sawn	200,000	204,000
" planks	37,000	13,000
Red pine	63,000	22,000
Dantzic, etc., fir	219,000	59,000
Sweden and Norway fir	4,000	7,000
Oak, Canadian	524,000	714,000
" Baltic	37,000	1,500
Elm	43,000	35,000
Ash	13,000	9,000
Birch	275,000	86,000
Greenheart	38,000	117,000
East India teak	77,000	93,500
	Stand'ds.	*Stand'ds.*
Quebec pine and spruce deals	11,095	6,766
B. B. & N. S. spruce deals	30,641	21,592
" pine deals	1,856	2,224
Baltic deals	6,943	3,468
" boards	790	1,002
" flooring boards	2,330	2,091

The total tonnage employed in the conveyance of wood goods to Clyde ports during the year 1880 has amounted to 184,000 tons ; from British North America alone 123,000 tons ; showing 5,000 tons more than the average of the last ten years. From United States (pitch pine), tonnage employed during 1880, 28,400 tons ; India (teak), 13,200 tons ; Mexico (mahogany), 3,200 tons ; Baltic ports and Norway, 5,000 tons, etc. For the conveyance of wood to Grangemouth, through which port this market is supplied with Baltic and Norwegian goods, the tonnage employed during the past year amounted to 99,968 tons. Of this total a small proportion represents imports from Quebec and Pensacola to Grangemouth.

During the year 1877 Quebec square yellow pine was imported to the amount of 77,472 pieces, while the total of 1880 only reaches 36,787 pieces, with a consumption of 43,899 pieces, and in 1879 import 13,231 pieces, and consumption 34,500 pieces. These figures show that much of the consumption of the past two years has been drawn from the unusually heavy import of 1877. The stock now on hand seems to be moderate. Birch timber shows a very heavy import during last year, 9,676 pieces; and the consumption 7,921 pieces. The stock on hand at 31st December last is about equal to that of 1878. The probability of a sparing import for the current year should have a tendency to improve prices.

There has been a marked increase in the import and consumption of pitch pine, a total of 96,694 logs being the import of 1880, and 71,465 logs the amount of consumption, as contrasted with an import of 43,506 logs, and consumption 35,725 logs during 1879. This wood appears to be improving in value and general estimation.

Yellow Pine.—Quebec waney boardwood : the stock at the beginning of the year was much less than usual, and an advance in prices soon took place, which is still well maintained. Recent sales of prime 19 in. average square have been at 2s. 4d.@2s. 7d. per foot.

Deck plank wood.—Prices, 60 to 70 feet average per log at 2s. 3d.@2s. 4½d. per cubic foot ; 90 ft. average at 2s. 6d. per cubic foot. These figures are much the same as were realized at the beginning of the year, and for the spring months a fair demand is anticipated, as shipbuilding promises well.

Building timber.—The import has been judiciously curtailed, and the stock now on hand is comparatively light, which is satisfactory in view of the dull state of the house-building trade ; 50 ft. average recently brought 14d.@16d. per ft., showing an advance on prices current at the beginning of 1880.

Red pine.—Parcels of 30 to 35 ft. average have recently sold at 14d. to 16d., being much the same prices as were obtained in the opening of the year.

Pitch pine.—There has been a very heavy import and large consumption during the year. The stock on hand is not very heavy considering the rate of consumption, and prices at present current are very similar to what they were about a year ago—hewn of 80 to 90 ft. average 20d. to 21d.; and sawn, 35 to 40 ft. average, 18½d. to 19½d.

Elm.—Present prices, 2d. 1d. to 2s. 2d. per cubic ft. for 45 to 66 ft. average, and 1s. 10d. per cubic ft. for 30 ft. average of good quality.

Ash.—Import and consumption during the year show a marked increase, this wood coming more into use by cabinet-makers ; prices 2s. to 2s. 3d. per cubic ft.

Birch.—Current prices Quebec of 16 in. average, 1s. 7d. per cubic ft., lower port, 15 to 16 in. average, at 1s. 4d. per cubic ft. Stock on hand may be called moderate, considering the rate of consumption experienced during the past year.

Deals.—Prices : 1st quality Quebec pine deals, 2s. 2d. to 3s. per cubic ft.; 2nd quality, 1s. 7½d. to 1s. 10d.; 3rd quality, 1s. 2½d. to 1s. 5d. Lower port pine deals, 1st, 2nd and 3rd quality mixed, at 11d. to 1s. 1d. per cubic ft. Spruce deals at 10d. to 1s. 1d. per cubic ft. Last year's total import of deals shows a very large increase over that of 1879. The most marked increase is in lower port deals, of which there were large arrivals in the spring of 1880. There is at present an ample stock of Quebec deals, but of other descriptions the supply is quite moderate.

Prices have undergone very little change during the year.

The reports throughout the entire kingdom show an increased importation for last year and larger stocks on hand at the close, notwithstanding an improvement in trade and a larger consumption.

TIMBER SUPPLY.

There are few questions more important to Western Ontario farmers than the question of timber culture for future use. Forests have been cut down with almost criminal waste and no new ones planted, and even in the Orillia districts ten years will use all lumber fit for the saw. While the futre lumber supply has been much talked of, a few farmers in that neighborhood, show the question not so hard of solution. Having planted a few acres of poor land, they found it does not require many years to grow profitable timber, and that if its culture were properly understood there is little occasion to offer any inducement to plant beyond the self-interest involved in itself, just as there is in any other business pursuit. The man who plants an orchard does not expect to get any return until it is ten or fifteen years old. He knows that if he wants to sell his farm before the trees bear fruit, the statement on the sale-bills that it contains "an orchard of fruit trees just coming into bearing," will help the bidding wonderfully, and it would be the same with the trees if the timber question were properly understood. These parties state that a piece of woodland properly planted will come into use as quickly as an apple orchard will, and a farm of one hundred acres that had a few acres of young forest would bring far more than the additional cost of planting, should the farmer be forced to sell before the timber matured. All this implies that it be properly located. It would neither be prudent nor profitable to plant where a whole acre of timber could be bought for a few dollars any more than it would be wise to plant apple trees the fruit of which nobody would buy. There is, however, no doubt that in fifteen or twenty years, over a large district of our Province, timwill be scarce and lumber high-priced, and that those who plant now will be well rewarded though the trees be not large enough for sawlogs then, yet the little plantation would come well into use for fuel and other purposes. Every one who own a farm should look about him and see how the timber prospect is, and, if he sees a probable scarcity in the market or in his woodshed, plant a few acres to supply the deficiency.

Where the Wood Goes.

To make shoe pegs enough for American use consumes annually 100,000 cords of timber, and to make our lucifer matches 300,000 cubic feet of the best pine are required every year. Lasts and boot-trees take 500,000 cords of birch, beech, and maple, and the handles of tools 500,000 more. The baking of our bricks consumes 2,000,000 cords of wood, or what would cover with forest about 55,000 acres of land. Telegraph poles already up represent 800,000 trees, and their annual repair consumes about 300,000 more. The ties of our railroads consume annually thirty year's growth of 75,000 acres, and to fence all our railroads would cost $45,000,000, with a yearly expenditure of $15,000,000 for repairs. These are some of the ways in which American forests are going. There are others ; packing boxes, for instance, cost in 1874 $12,000,000, while the timber used each year in making waggons and agricultural implements is valued at more than $100,000,000.

THE Thunder Bay *North Star Miner* urges the establishment of rolling mills and blast furnaces at that place. It expresses the opinion that "Thunder Bay is the one point most favorable for the erection of rolling mills and blast furnaces, and capitalists can find no better site, and no better time than the present, for the establishment of industries of this nature. There is here the necessary deposit of ore in quality and quantity, the opportunity of disposing of their manufacture at a large profit, and the matter of labor is also favorable, for it is generally abundant at fair wages."

TWELVE months ago only ten furnaces were in blast in Virginia. There are now 30 stacks for charcoal pig iron, with ten in blast ; eight stacks for coke iron, with eight in blast—24 stacks in blast out of 38 furnaces in the State. There has been an increase of five stacks this year (1880) in Virginia. So far the accumulation of pig iron is merely nominal. Throughout the State and the bordering States of North and South Carolina, Tennessee and West Virginia, the iron industries are prospering, and the promise for 1881 is most satisfactory.

Chips.

OAK is stronger than iron, both pieces being of equal weight.

THOSE who pretend to know predict a busy and therefore prosperous season for the owners of vessels during 1881.

LUMBERMEN in Pennsylvania have been compelled to suspend work on acoount of too much snow in the woods.

The number of boiler explosions in saw, planing and woodworking mills in 1880, was 47, and every explosion killed, on an average, one man and a half.

SINCE national banks were founded in the United States, the Government is the gainer by the single item of the loss in circulation notes of the banks to the extent of at least $3,500,000.

ACCORDING to the *Lumberman's Gazette* St. Louis is making rapid strides as a lumber market, and says that its receipts and sales for 1880 entitles it to rank as the third if not second lumber market in the United States.

THE new mode of manufacturing flour is being introduced into the Guelph, Ontario, mills, and promises quite a revolution in the trade. Iron rollers and middlings purifiers are the order of the day, and a very superior flour is the result.

DURING the last ten years the tonnage of Antwerp has increased 242 per cent. against an increase of 110 per cent. at Hamburg, and 36 per cent. at Liverpool during the same time. This does not look as if protection were killing the trade of Antwerp.

IT is doubtful if the iron foundries and machine shops in Montreal were ever so actively employed as at present. They are all working extra hours, yet unable to fill orders rapidly enough. A great deal of the work is for Manitoba and the North-West.

E. BURNS, of Hamilton, Ont., has been asked by a British company to act as agent for the purchase of timber lands either in Canada or the States. The company is prepared to invest $500,000; it is proposed to manufacture the lumber, and ship it direct to England.

IT is anticipated that the supply of peaches in the Western and Southern markets next season will be very scant. Not many peach buds are likely to escape the frost at some points. At some places even as far south as Arkansas it is feared the trees are killed as well as the buds.

THERE are many kinds of popular possessing qualities in some cases of no inconsiderable value when properly employed. Flooring boards, for instance, very tough and lasting, are made from some of the kinds, and are said to be all but fireproof, naturally, therefore, very unsatisfactory firewood.

THE lumber dealers of Chicago are agitated by the provision of a pending city ordinance requiring keepers of lumber yards to take out special licenses annually. They not only object to paying the fees but to being classed with distillers, brewers, billiard hall keepers and pawnbrokers.

A DEPUTATION of lumbermen from the Upper Ottawa waited on the Hon. Mr. Chapleau to protest against the imposition of the additional taxes which have lately been placed on the lumber by the Quebec Government. Mr. Chapleau promised to lay their grievances before his colleagues.

THE state of Nevada has a remarkable timber, known as mountain mohogany. The trees are not large, averaging less than a foot in diameter. The seasoned timber is said to be as hard as boxwood, of a very fine grain, of a rich red color, very heavy, and a fine material for the wood carver.

QUITE a lumbering business is springing up at Rat Portage, at the head of Lake of the Woods, a number of large saw mills are being constructed there. They are surrounded by considerable forests of pine and more extensive tracts of popular. The Canadian Pacific railroad crosses the Winnipeg river at Rat Portage, and a town of some importance is likely to result.

JAMES SMITH & Co., of Liverpool, in their annual circular say:—The year 1880, just closed, has, with few exceptional circumstances, been the first fairly satisfactory year the wood trade has enjoyed for many years past, and there is a strong opinion, expressed by many experienced buyers, that it is the commencement of several prosperous years.

THE new departure in the mode of bringing square timber down the Ottawa Valley promises to be successful and remunerative. A special train of twenty cars containg square timber from Mackey's station on the Upper Ottawa arrived at Ottawa the other day. The trip is now done in about twelve hours with no loss of timber. It formerly consumed several weeks.

Mr. WATSON, in his *Mechanical News*, says that the best packing he ever used for faced joints, either steam or water, is common drawing paper soaked in oil. After a short time the heat of steam converts it into a substance like parchment, so that it is practically indestructible. It has the advantage of stripping readily from surfaces when it is desired to break a joint.

THE Chicago lumbermen have instituted a system of weekly lunches at the rooms of the exchange, some member furnishing the spread and presiding as host. After disposing of the viands a business meeting is held and matters of interest to the trade are discussed. The attendance at the meetings of the exchange is said to have increased since the new order has prevailed. Lumbermen love to eat, no doubt.

THE Guelph *Herald* says that Mr. James Campbell, of East Williams, drew into Strathroy recently, with one team (one of which was his champion plough horse and the other a horse 24 years old), a stick of square oak which the culler scaled at 216 feet. He handled two other sticks which measured respectively 168 and 140 feet, the three making 516 feet. It was pretty generally supposed that the timber in this region was about exhausted, but these sticks do not point that way.

THE PROSPECT FOR BUSINESS.

If there is not to be a continuation of the business activity throughout the present year, and a large increase therein, the signs are very misleading. The flow of specie to this country continues, and the amount coming on account is not the whole sum, by any means. The stream of immigration is still pouring into this country, and the thrifty Germans coming are bringing with them no small amount of money, one train load which passed over a Michigan railroad the other day being reported as carrying westward more than one hundred thousand dollars. There has not been, at least since 1873, such an amount of railroad building done as is proposed this year, and never such gigantic enterprises on foot. Railroads are projected in every direction, and the money for their construction is at hand. Such grand enterprises as the world never saw since Rome built the Appian way, are under construction. The Canadian Pacific railroad, to cost some $90,000,000, and traversing the wilderness of the north to bind the British possessions in a closer union. The Northern Pacific, which is being pushed with remarkable energy and will be finished in 1882, although it was once considered a "dead duck." The Central and Union Pacific railways are spreading themselves out northward to mineral regions, coal lands and agricultural and grazing districts. The Union will soon have 3,000 miles of roads tributary to it, and the Central is destined to become a part of a line under one management extending entirely across the continent. The Southern Pacific railroad only lacks a few miles of completion, and will unite the Atlantic at Norfolk with the Pacific at San Diego as well as San Francisco. The new south-western system planned by Jay Gould has the ancient city of Mexico as an objective point and will probably be extended to Guayumas on the Pacific. Then there are the several schemes for crossing the isthmus of Central America, one of which will probably break ground this year and go forward until completed. There is no end of lesser railroad enterprises, which at other times would have been great undertakings, but are now mere bagatelle beside those above named. There is money for all, and the dirt will fly in a lively manner on all this year. Business is bound to be good while it lasts. Labor will be in good demand, money will be plenty and more building and repairing will be done, making an additional demand for lumber. This is going to be a good year for the trade, and no mistake.—*Lumberman's Gazette.*

THE QUEBEC TIMBER DUES.

On Tuesday of last week an influential deputation, representing the lumbering interests of the Ottawa District, Quebec and Montreal, waited on the Hon. Mr. Chapleau at his office in this city in reference to the proposed increase in the timber tariff in the Province of Quebec. The deputation was composed of Messrs. Alonzo Wright, M. P., John Rochester, M.P., John Poupore, M.P., Peter White, M.P., Col. Allan Gilmour, J. K. Ward, Mackey and several others. The timber dues heretofore have been levied upon each saw-log according to its dimensions, and the tariff has been for every log 13½ feet long and 16 inches in diameter and under 10 cents, and for every log of 13½ feet in length and 17 inches and over in diameter, 15 cents. To this rate the lumber dealers never objected, but by a recent order in council it appears that the Government propose to increase the tariff very greatly. It is now proposed to levy a tax of 12½ cents upon the smaller class of logs and 26 cents on the larger. This rate the lumbermen consider exorbitant, and ask that the dues be levied in the same manner as in Ontario, viz., that each log be taxed in proportion to its contents, superficial or board measure. In Ontario the tariff is 75 cents upon every thousand feet, and this mode of levying duties is found much more equitable for all concerned. The lumbermen ask for a reduction in the proposed duties, as they consider that to put such a tariff in force as proposed would seriously hamper the whole lumbering business of the Province, and result in a great waste of timber, and calculate that under the proposed tariff instead of 75 cents per thousand as in Ontario the duty in Quebec would amount to about $1.50 per thousand. The Premier informed the deputation that the Province was sadly in need of an increased revenue, and that other sources of revenue being almost exhausted, it had been decided to increase the timber dues, but he would bring the matter before his colleagues in the Government, with the recommendation that the Ontario system of levying dues be adopted. —*Montreal Witness.*

PUGET SOUND TIMBER.

A correspondent of the Chicago *Times* writes as follows concerning the fir tree growths of Puget Sound, W. T. :—He says the trees average 200 feet in height, and asserts that some specimens have been cut down in his presence that were 320 feet in length by 12 feet in diameter at the base, having a straight and well proportioned log length of 90 feet to the first limb, and being 2 feet in diameter within 20 feet of the top. The cedar trees are in like proportion, and are most valuable for wooden wares of all kinds, while the fir trees are the best for spar and ship timber yet found in any country, and there are but few maratime nations in the world that do not use it in their ship building. One-fourth of the wealth of San Francisco was culled from the firs of Puget Sound while the Government slept, and to-day all the principal large mill owners who saw and prepare for the market from 100,000 to 200,000 feet per day to each mill —and there are 30 or more mills—are all residents of San Francisco, where they invest their profits to the perpetual hurt of Puget Sound residents. A cedar and fir forest is, of itself, a great curiosity; so dense are the tree growths in some places that the sunlight of heaven never reaches the earth at their base. One monarch after another will be found grouped together like an immense barricade. When one of these huge firs is felled by the woodsman, the crash, bound and concussion that resounds over the earth remind one of heavy peals of distant thunder, or the explosion, miles away, of some great powder magazine. There is, apparently, no exhaustion of the timber, and 100 years will possibly pass away before the Puget Sound forests will be cleared of their immense resources of various tree growths; hence, that wealth alone far exceeds that of the entire state of New York.

To Fix Pencil Marks.

To fix pencil marks so they will not rub out, take well skimmed milk and dilute with an equal bulk of water. Wash the pencil marks (whether writing or drawing) with this liquid, using a soft flat camel hair brush, and avoiding all rubbing. Place upon a flat board to dry.

A FOREST MONARCH

Mayor Sleeman, of Guelph, having bought the oak timber rights on the property of Mr. Beeley, near Kossuth, county of Waterloo, had brought home the ten feet butt cut off a certain tree to his brewry, where it was much admired by the members of the Local Legislature during their recent visit. Desirous of obtaining a section of what was evidently an uncommon specimen of tree growth, Professor Brown and some students of the Ontario Agricultural College, by kind permission of Mr. Sleeman, went to Kossuth last Saturday. They found an easy slope of free clay loam, having a south-eastern exposure, and covered all over some 200 acres—with rare samples of maple, beach, ash, birch, elm, bass, and oak, in all their glory of height, girth, and plenty; a rare bush for the older townships of Ontario, and well worth $200 per acre.

About the year 1505, one of these oaks appeared above ground—probably from the dropping of an acorn by a previous monarch long deceased, and may now be growing fine wheat in the immediate neighborhood. In 1881 the proceeds of this acorn are being made into beer barrels, and part rescued to adorn a museum.

This tree is the *Quercus Rubrum*, or Red Champion Oak of America, and in the example now felled stood 135 feet from top to toe; girthed 17 feet 9 inches inside the bark, two inches from the ground, the bark being four inches thick ten feet up. The stem was straight and branchless for 66 feet, and gave measureable timber fifty feet above that. Not a flaw, nor rotten hole of any sort disfigured this magnificent specimen. It grew fresh wood all around last year, as much as it did three hundred years ago, and by careful calculation the students made the age 375 years. The contents of the stem proper are 530 cubic feet, and 90 for top timber—in all 620. We do not know what Mayor Sleeman paid for this "stick," but laid down at Liverpool it is worth $450. Weight 15 tons. Made into inch boards it would floor the largest hall in Canada.

It was a flourishing seedling only fifty years after the discovery of the American continent by Columbus; was seven inches in diameter when England's Virgin Queen reigned. It could tell of the time when the Niagara falls were a quarter of a mile further down stream than now, and at the declaration of American Independence would have made a shed to cover four hundred men.

Nevertheless, it may never have sheltered a red man, as being out of the usual paths, though hungry bears must often have been served with acorn dinner.

What a pity somebody won't try to rouse our national pride towards legislating something to conserve even individual specimens of our forest wealth and beauty. Everybody appears to be so well off, and so busy, that a few strokes of the axe wiping out of existence a four century monument calls for no lament, and certainly calls to no action. When will Canada know what a tree is in all its relationships?—*Guelph Mercury.*

Two Thousand Dollars.

The easiest, cheapest and best way to secure the above amount is to apply for membership in the Mutual Benefit Association of Rochester, N.Y. Pay Dr. S. B. Pollard, 56 Bay Street, one dollar for four medical examinations, he will send your application to the head office, if you are accepted as a member they will issue a certificate of membership, which, on payment of eight dollars, entitles you to full benefits as a member, should you die to-morrow, next day, next week, next month, or any time within three months, this Association will pay to your heirs or assigns, the sum of two thousand dollars. At the expiration of the three months all you have to do is to pay your pro rata amount, which is from 20 to 75 cents on the death of some other member, who has done nothing worse than to die during the three months just past. By paying your assessments on deaths, you keep your certificate alive, and at the commencement of the second year you are assessed two dollars per thousand to keep up office expenses, etc., for the next year. No easier, surer or better schemes to carry two thousand dollars has ever been devised than the Mutual Benefit Associates, of Rochester, N.Y.

Market Reports.

OFFICE OF THE CANADA LUMBERMAN,
March 10th, 1881.

We have been unable to obtain any reliable figures with regard to late transactions (if any) in the Canadian markets, and therefore refrain from giving those that would be necessarily valueless. We trust, however, by our next issue to have such arrangements completed as will enable us to discharge our duty in this respect.

New York Lumber Market.

The report of the Real Estate Record shows that the market is presenting fairly cheerful features. The majority of the trade speak hopefully of the outlook and if all expectations and predictions are realized there is a first-rate business ahead. Accumulations commence to dwindle and break up, and the additions cannot amount to much for a considerable time ahead.

Spruce meets with some demand for both prompt and distant delivery, but there is no excitement or undue anxiety on the part of buyers, and the market fails to receive a decided stimulus. Quotations as named range from $15.00 up to $17.50 for randoms, and thence up to about $20.00 for specials, with extra difficult held higher. Quite a number of cargoes of random are said to be afloat for this market.

White pine remains in a pretty firm position, and holders express much confidence over the outlook. Available stocks have been greatly reduced, additions cannot be made except at much trouble and expense, and the demand, as a whole, is promising. We quote $17@20 per M. for West India shipping boards; $23@24 for South America do.; $15.50@16.50 for box board; $17.00@17.50 for do. wide and sound do.

Yellow pine continues somewhat in sellers' favor, but more particularly on specials. On random, offering of either old accumulation or current arrival, the tone is unsettled, but inclined to a little weakness, especially on boards. We quote random cargoes at about $23.50@25.00 per M.; ordered cargoes, $25@26 do.; green flooring boards, $24@25 do.; and dry do. do $25 @26.50. Cargoes at the South $14@17 per M. for rough, and $19@20 for dressed.

Saginaw Valley.

The *Lumberman's Gazette* of February 20th says :—

The market this week presents no special features to distinguish it from other points where a firm feeling and confidence in the future prevails. There is no especial activity noticeable, but orders and enquiries are being received daily. The sales made are generally satisfactory; in fact, they have to be satisfactory, especially to the seller, or they are not made. When we speak of sales, of course reference is had to lumber to be delivered on the opening of navigation. When this is remembered, the confidence in the future stability of the general market will be more fully realized. Not less than 100,000,000 feet of stock will have been bought before the opening of navigation at prices averaging $7, $14 and $32. It must be admitted that this is a pretty good indication of a stable market. Sales have been made the past week at $7, $14 and $32, $6.50, $13 and $30 and $7.50, $15 and $35 for cargo lots.

The demand for shingles has increased, and the stock on hand has been pretty much exhausted. Clear butts command $1.90 @ $2.10, and XXX $2.90 @ $3.10.

The expectation is that freights will rule higher than last year. These expectations seem justified by the facts that there will be demands made upon the lake marine in excess of the tonnage added since the close of navigation last year. Some contracts have been made for the entire season of 1881, but the terms have not transpired.

The rates of freight by rail from the Saginaw Valley, for 10 tons, to Albany is $60; to Burlington, Vt., $76; to Buffalo, N. Y., $36; and to New York city $66.

The Australian Timber Trade.

In their monthly timber report, dated Melbourne, Dec. 23rd, 1880, Messrs. Gemmell, Tuckett & Co., state as follows :—Since our issue of the 25th ultimo a large amount of business in timber has been carried through, both at auction and privately, and prices on the whole have been well sustained.

AMERICAN LUMBER.—We report sales ex *Willard Mudgett*, *Ladogo*, *B. Webster*, and *Penobscot*, realizing—for Canadian clear, £14; white pine shelving, £8. 12s. 6. to £10. 10s.; white pine, t. and g. ceiling, £9 per m. super. We hear the clear pine ex *J. A. Borland*—49,238 ft.—has been placed privately at full rates We note the arrival of *W. H. Besse*, with 264,083 ft. shelving, 56,246 ft. white pine, t. and g. ceiling, 10,356 ft. Canada pine siding, 495 spruce deals, and 25 m. 4½ ft. sawn laths. Shipments advised are very moderate, and we look for higher rates being obtained for parcels here and to arrive.

CANADIAN TIMBER.—The cargo ex *R. B. Fuller* was sold at auction on the 17th inst., about three days after the vessel was berthed, realizing—for 2 in. and 3 in. clear, £18 to £18 7s. 6. per m. super; 1 in. do., £15 10s. do.; 6×⅞ t. and g. spruce, 8s. per 100 ft. lineal; 6×⅞ t. and g. red pine, 8s. do.; 11×3 spruce deals, 4d. to 3 11-16d. per ft of 9×3; 9×3 do.; 3 7-16d. to 3 5-16d. do.; 8×3 do.; 3 5-16d. do.; 7×3 do.; 2 15-16d. do.; 2 in., 3⅝d. to 2⅞d. do.; 11×1, 10×1, 9×1, 8×1, do.; 3⅝d. to 3¼d. do.; red pine deals and boards, 4½d. do. Ex *P. J. Carleton*, 11×3 spruce, 3⅝d. do., 9×3 do., 4d. do.; 7×3 do., 3 9-16d. do.; 11×1 do., 3⅝d. do. As the *Republic* is now the only vessel to arrive this season from Canada, and will comprise our whole stock in first hands, we expect prices will advance.

COMPARATIVE IMPORTS.

	1880.	1879.	1878.
Spruce deals	56,531	113,053.	60,952

Glasgow.

The imports of foreign timber to Clyde during last week are three cargoes, consisting respectively of mahogany, greenheart, and pitch pine. The mahogany is the cargo per *Ensign* from Belize, the arrival of which, off coast, was announced by the brokers, Messrs. W. Connal & Co., in last issue of the *Journal*. The date of sale is now fixed for the 25th current, at Yorkhill Wharf, Glasgoow.

With regard to the public sales of American timber and deals, reported below, prices are steady; but, owing to the present inclement weather, purchases have been light, various departments of out-door work being hindered from proceeding, and buyers consequently not disposed to stock heavily.

AUCTION SALES.

On 10th inst., at Greenock, Messrs. Allison, Cousland & Hamilton, brokers :—

Quebec waney boardwood, 50 c. ft. av. per log 2s. 1½d. per c. ft.
Do. 33 to 43 c. ft. av. per log 1s. 8d. to 1s. 11½d. per c. ft.

SEALED TENDERS, marked "For Mounted Police Provisions, Forage and Light supplies," and addressed to the Right Hon. the Minister of the Interior, Ottawa, will be received up to noon on Saturday, 5th March.

Printed forms of Tender containing full information as to the articles and quantities required, may be had on application at the Department.

No Tender will be received unless made on such printed forms.

No payment will be made to Newspapers inserting this advertisement without authority having been first obtained.

J. S. DENNIS,
Deputy Minister of the Interior.

FRED WHITE,
Comptroller.

Ottawa, January 28, 1881. b10

NOTICE.

SEALED TENDERS addressed to the Superintendent General of Indian Affairs, and endorsed "Tender for Indian Supplies," will be received at this office up to noon of Saturday, 26th February, 1881, for the delivery of the usual Indian Supplies, duty paid, at different points in Manitoba and the North-West Territories for the year 1881-82—consisting of Flour, Bacon, Groceries, Ammunition, Twine, Oxen, Cows, Bulls, Agricultural Implements, Tools, Harness, &c.

Forms of Tenders and full particulars relative to the supplies required, can be had by applying to the undersigned or to the Indian Superintendent, Winnipeg.

The lowest or any tender not necessarily accepted.

[No Newspaper to insert without special authority from the Department through the Queen's Printer.]

L. VANKOUGHNET,
Deputy of the Superintendent General of Indian Affairs.

Department of the Indian Affairs,
Ottawa, 17th Jan., 1881.

The time for receiving tenders for Indian Supplies is hereby extended to noon on Saturday, the 5th of March, 1881.

L. VANKOUGHNET,
Deputy of the Superintendent General of Indian Affairs.

Department of Indian Affairs,
Ottawa, 14th February, 1881. b10

PORT HOPE.

THE RUSSELL HOUSE,

OTTAWA.

JAS. A. GOUIN, - - PROPRIETOR,

Is the Favourite Resort of Leading Public men of the Dominion attending the annual Session of Parliament.

Ministers of the Crown, Senators, Members of Parliament, Public Officials, as well as those having business with the various Departments of the Government. It is also the headquarters of those having dealings with the princely Lumber Manufacturers in the Great Pine Valley, of which Ottawa is the acknowledged centre.

THE RUSSEL HOUSE being central, almost abutting on the magnificant PARLIAMENT and DEPARTMENTAL BUILDING—the pride of the Country—is thus conveniently situated for those visiting the City on public business. But the location is also everything that could be desired alike for the man of business and the man of pleasure. A few minutes walk brings the guest of the Hotel within reach, not only of all the principal business resorts, but also of the most splendid Mountain and Valley Scenery that can be seen anywhere, as also of the two almost unrivalled Waterfalls—the Chaudiere and Rideau—and of the extensive Manufacturing Establishments and Depots of the leading Lumberman. But, besides the beautiful scenery, which, it may be mentioned, includes the magnificant Ottawa and two of its grand tributaries—the Rideau and Gatineau—there are in the immediate neighborhood, beautiful Lakes and apparently never-ending woods, which afford opportunities for the finest Fishing and Shooting that can be obtained on the Continent.

THE RUSSELL HOUSE affords excellent accommodation for 300 guests; its table is abundantly supplied with Viands of the choicest description, in season, and nothing is left undone to make every visitor feel comfortably "at home."

☞ **Omnibusses meet the Arrival of every Train and Boat.** b26

American Hotel, Corner Young & Front Sts.,

MACHINERY OILS!

TO DEALERS & CONSUMERS.

STOCK OLEVINE,
Equals Castor Oil, and
Warranted not to Gum,

STOCK OLEVINE,
Equals Castor Oil, and
Warranted not to Gum.

It will give the subscriber much pleasure to forward, post free, to any address, on application, a pamphlet, containing instruction and information that have been found of the greatest practical use to dealers and consumers of machinery oil in Canada. It contains the fullest information as to the different kinds of oils, their qualities and uses, thus enabling the consumer to make choice of the very oil best adapted to his wants, and also enables the merchant to select the kinds most likely to be in demand in his neighborhood. The pamphlet shows conclusively that oils properly manufactured from petroleum, are vastly superior to any *animal* or *vegetable* oil. I am now making the same qualities of "Extra" and "XX" oils I manufactured from 1870 to 1873. They are *guaranteed not to thicken with extreme cold*, and warranted to give satisfaction in every particular. Beware of Agents soliciting your orders without my trade-marked order-book.

b12 Address GEO. B. STOCK, P. O. Box 1146, Toronto.

THE GENUINE SILVER-STEEL, Lance Tooth CROSS-CUT SAW!

It stands without a rival, and is the fastest cutting saw in the world. It has beaten the best Canadian and American made saws 33½ per cent in every contest. Its superiority consists of its excellent temper. It is tempered under the secret Chemical Process, which toughens and refines the steel. It gives a finer and keener cutting edge, and will hold it twice as long as any other process. We have the sole right for this process for the Dominion of Canada.

None genuine that are not like the above cut, with registered trade mark with the word "The Lance," and Maple Leaf with our name. Price $1 per foot.

CAUTION.—Beware of Counterfeits. There are inferior counterfeits on the market, which are intended to be sold at a high price upon the reputation of this saw. We will send to any address a saw exactly like any counterfeit, warranted equal in quality or no sale, at 60c. per foot. Therefore do not be humbugged into paying a first-class price for a second-class saw. A fact to bear in mind is that if the material and temper are not of the very best quality the shape of the teeth amounts nothing. A saw, like a knive, will not cut fast without it will hold a keen, cutting edge. We have cut off a 14-inch sound basswood log in eight seconds with this saw. Manufactured only by

SHURLY & DIETRICH,

Manufacturers of Saws, Plastering Trowels, Straw Knives, &c. &c.

WITH THE TOMLINSON
(PATENT)
BARREL MACHINE

One man and two boys can turn out

One Hundred and Fifty First-class Flour Barrels in Ten Hours,

made from veneered wood of two thicknesses. The inside is one solid sheet of veneer running around the barrel, making in reality one hoop from top to bottom, and in the outside thickness the grain is reversed, running up and down, finished with five hoops two inches wide, reversed again, making the barrel almost three thicknesses, which gives the package superior strength, tightness and durability over the ordinary hand-made flour barrels, yet with all its many advantages cost less than the old style of package. My barrel machine is arranged to make all sized packages from a large barrel down to small nail kegs, butter packages and cheese boxes. I am open to prove at any time the superior strength of my barrel. That one will stand more hardship by any actual test than one hundred of the old ordinary flour barrels. County rights for sale, and all information given by applying to

M. Covel's Latest Improved Automatic Saw Sharpener!

Is the Most Perfect Machine that has ever been Introduced into Mills for that purpose.

CIRCULAR SAW STEAM FEED!

I would also call special attention to my

Heavy Circular Saw Mills

and for STEAM MILLS, would recommend the Steam Feed, having put in several which are giving the best of satisfaction, as will be seen by the following testimonials:—

GRAVENHURST, August 20th, 1880.

WM. HAMILTON, ESQ., Peterborough.

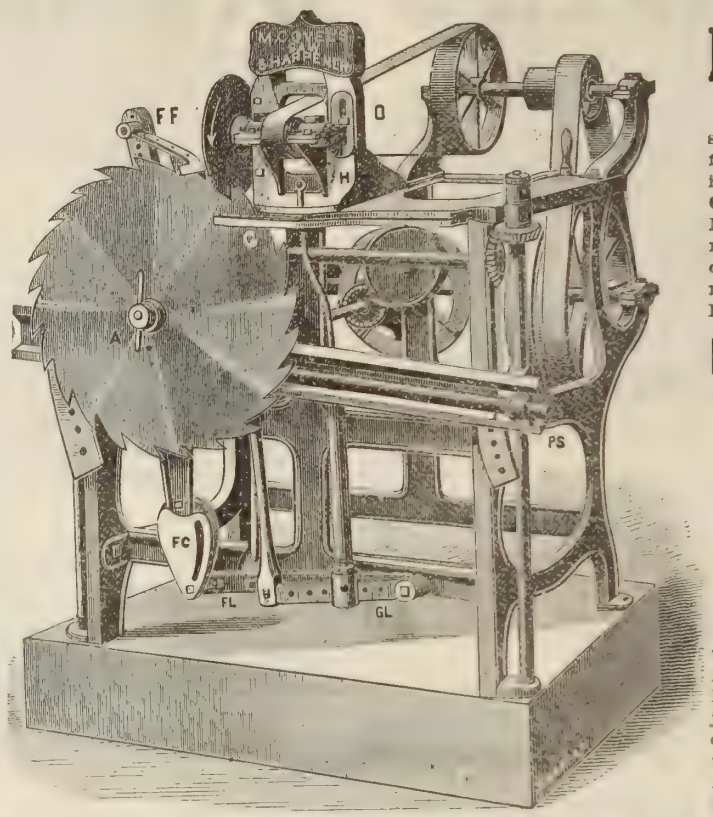
DEAR SIR—I have used your Steam Feed for near four months, and it has given me perfect satisfaction in every way; it is admitted by every person who has seen it work to be the best feed ever invented. Since I put it into my mill, I have not lost ten minutes time fixing anything belonging to it. I can cut 18 boards 13 ft. long in one minute. It can do much smoother and better work than the pinion feed. It is easily governed and reverses the carriages instantly. I am thoroughly satisfied with it and can recommend it to any person who has a Circular Saw Mill for cutting long or short logs. I consider I have cut more lumber than will pay for the Steam Feed since I got it than I would have cut had I not put it in.

Yours respectfully,
WILLIAM TAIT,
Lumberman, Gravenhurst.

TORONTO, August 11th, 1880.

WM. HAMILTON, Peterborough, Ont.

DEAR SIR—The Steam Feed you put in is working splendidly. Yours, &c.,
THOMPSON, SMITH & SON.

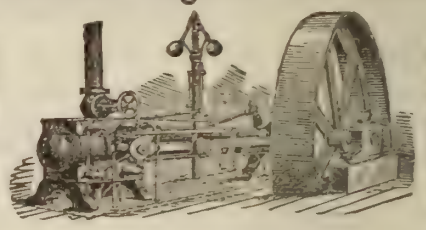


MILL MACHINERY!

I am also manufacturing Saw Mill Machinery, for all sizes of Gang or Circular Mills, Span or Double Circulars for Slabbing Small Logs. My Patent Jack Chain for drawing logs into Saw Mills, acknowledged by all to be the Cheapest and best ever got up; also, my Patent Lumber Markers, different sizes of Edgers, Gang Lath Mills, Trimmers, Power Gummers, and all Machinery used in a first class Gang or Circular Saw Mill; also, small Hand Gummers for use in the woods, for Cross-cut Saws. Rotary Pumps of different sizes, for Fire Protection in Mills, &c.

Horizontal Engines and Boilers

CORLISS ENGINES



Where economy of fuel is the great consideration, along with uniformity of speed, such as is required in Grist and Flouring Mills, Woollen and Cotton Factories, or large Factories of any kind, I supply the Corliss Engine. I feel justified in saying that our Style, Workmanship and Finish on this Engine will be no discredit to its renown, and certainly is not equalled in this country for economy of fuel I have them working at 2½ pounds of coal per horse-power per hour. FORESTRY AND ARBORICULTURE.

BEING THE FOURTH CHAPTER OF THE REPORT OF THE ONTARIO AGRICULTURIAL COMMISSION.

In dealing with the large and very attractive subject of fruit-growing, the Commissioners have had occasion to use only the language of encouragement, but, in connection with the topic they have now to discuss, they have to utter words of warning, perhaps even to give expression to some alarm, for, from the day that the first pioneer settler entered Upper Canada until now, a process destructive to our forest wealth has been rashly, recklessly, wastefully, and it may even be said wantonly, going on.

No one seems to have stopped to inquire into the relations which, particularly in such a climate, the trees of the forest bore to the operations of the husbandman, affected the rain and snow fall, protected the crops, or served any other purpose than to supply fence rails or cordwood.

If the farmer who entered the country fifty or sixty years ago were told he might have secured for himself at this moment, in timber alone, an amount equal to the value of his farm at the highest given price, and that he could have obtained this without sensibly diminishing the area under cultivation, he might be incredulous. But there are, nevertheless, many districts where such an assertion would hold good, where a fortune which might have been saved has been split up into snake fences or sent whirling in clouds through the stove pipe.

Meantime, while men have toiled early and late to shelter themselves and their families—and let us hope their cattle too—in comfortable buildings, and to provide the necessaries of life, they have deprived the "staff of life" of its natural and necessary shelter, and seen, time and again, perish before their very eyes, the wheat and clover on which have depended much of their prosperity.

Small blame, it is true, attaches to the pioneer in a wooded country if he does cut and slash at all obstructions somewhat ruthlessly. The early settlers in Upper Canada often found themselves in circumstances almost desperate. They had neither roads, nor markets for timber if they preserved it, and, surrounded by what seemed to them an illimitable extent of forest, they naturally took small account of what might be the state of things in the days of their grandchildren or their great-grandchildren. But it is surprising to see that, even with the bare facts staring them in the face, our farmers who are practically to-day the owners of the remaining timbered lands of the Provinces in all the settled districts, are in a condition of profound lethargy or innocent unconsciousness of the dangers they invite or the losses they incur.

Still there is time even yet on many farms in not a few of the counties, for waste to be prevented, danger averted, and money saved, if men will only shake off the apathy they have hitherto exhibited, and see the true state of affairs in the light of self-interest, not to say self-preservation.

How little idea of providing against the continued depletion of the forests many of them have, was well illustrated by an incident that occurred during one of the early sittings of the Commissioners. The witness before the Commissioners was a gentleman enjoying beyond most the confidence of his brother agriculturists—an admirable specimen of an intelligent and substantial yeoman. To the question, whether anything had been done in this district in the direction of replanting forest trees, he replied in an almost surprised manner:—

"We do not think that we have reached the miserable condition which requires us to face that difficulty yet. We have more bush than there is in many parts of the West."

But it happened that, just before, this same gentleman had told the Commissioners, that his crop of fall wheat had been saved from winter-killing—by what?—*by the accidental shelter afforded it, not by his own, but by his neighbor's bush.* But for this—the merest chance—one of the best farmers in Ontario would not in all probability have had enough fall wheat to pay for the harvesting. And yet he almost scornfully repudiated the idea of planting a tree.

Nor is this all. Not only have the farmers of Ontario destroyed property of fabulous value, in the clearing process; not only have they denuded their lands of necessary protection; not only have they dried up their streams, and left dry ditches in many places to mark where once existed a valuable water-power, but they have been, and still are, going on very fast with the destruction of their supply of fuel. Instances have come within the observation of the Commissioners, where men who took up bush land thirty years ago have so thriftlessly managed their timber, that to-day they have used the last stick and are actually buying cordwood.

But there is hope yet. Ontario is not the only country that has had to face the situation in this respect, and is to-day, thanks to her prodigious forest wealth, better off than many. If some choice woods are nearly exhausted, many others of high marketable value still remain. There are, in the settled counties of Ontario, and altogether exclusive of free grant territory, containing every variety of timber used for economical purposes, forests as extensive in area as some not unimportant European principalities. The woods of Ontario consist principally of the elm, oak, ash, hickory, butternut, maple, beech, chestnut, poplar, birch, cherry, basswood, hemlock, cedar, tamarack, cotton wood, ironwood, whitewood or tulip tree, willow—where it has not been wholly destroyed—the walnut; and in addition to this the pines, balsams and spruces, in great variety. And all these have now a recognized place in the markets of the world. It is not the duty or purpose of the Commissioners to discuss the relations of the Government to the lumbermen, or of the latter to the settler. They look at this question solely as it affects the interests of the agriculturist, and through him the country, and while, as may be pointed out, the cultivation of the pine and other coniferous trees is to be encouraged on various grounds, it is with the deciduous (generally known as hardwood) trees they are most largely concerned, so far as relates to the question of timber supply or cultivation.

It is proposed, therefore, now to notice:—

1. The management on cleared farms of the bush, usually from five to twenty acres in extent.
2. The economic uses of the several varieties of timber.
3. The market value of various woods.
4. The age of trees maturing, and conditions in which they are merchantable.
5. Tree planting including choice of trees, methods, and cost.
6. The construction of wind-breaks or shelter belts in fields and orchards.
7. The planting of trees and shrubs for ornamental purposes.

Coppices.

The subject of coppices, or the cultivation of young timber from the stumps of a former growth, is discussed in Dr. F. B. Hough's very able report of 1877 to the United States Bureau of Agriculture. Some of the information given by Dr. Hough under this head will be of practical interest in the present connection. Dr. Hough says:—

"The coppice is a growth of timber of various deciduous kinds, from the stumps of a former growth, and is usually cut before maturity, at intervals of from ten to forty years, according to circumstances and the uses to which the product is to be applied.

"This mode of cultivation is in great favor for the growth of firewood, and the smaller wood used in various industries, and is the means by which tanning materials are often produced from the oak, where reliance is necessarily had upon this means for supplies.

"The coppice of short period produces hop-poles, and the stakes and vine-props so much used in vine-growing countries, and in many parts of this country may be able to supply, with but little care beyond protection, the fencing material and other woods required for farm purposes. It is destined to be in future of great importance in the growing of poplars for paper-making.

"The trees that sprout best from the stock are the ashes, elms, oaks, poplars, cottonwoods, willows, chestnut, linden, mountain ash, maples, sycamore, birches, alders, and hazel. The beech will reproduce but slightly, except in very favourable conditions, and the conifers not at all, with the single exception of the California redwood.

"Whatever may be the effect upon the durability of the timber by cutting at particular seasons, we have, in case of coppice growth, no alternative choice, and must cut in winter, and, by preference, toward the approach of warm weather but before the sap starts, as at this time alone will the stumps be in best condition for sending up a vigorous crop of young shoots. The months of February, March, and first part of April are generally best for this labor.

"In cutting, with the view of reproduction, the stumps should be left low, and the tops sloping and smooth, so as not to admit water. It is sometimes the practice to dress off the stump in a convex form with an adze, taking especial care not to separate the bark from the trunk. It is along this line of union, between the wood and the bark, that the young shoots start, and if separated they will not sprout.

"In the cutting of coppice woods it is often the practice to leave a certain number of choice trees of the more valuable kinds to grow to full maturity, and thus acquire a much greater relative value than if cut small. These reserves may be kept through two or three periods or 'revolutions.' They influence the young growth by their cover and shade, and when properly distributed may be, on the whole, beneficial rather than injurious to the future crop. They should not cover more than a twentieth, or at most a sixteenth, part of the whole surface. As same stocks will be weakened by repeated cutting, care should be taken to secure new roots from time to time, and one means of doing this is to bend down the tops of some of the sprouts and bury them partly in the soil, by which means new roots will in some species form, and when fairly established they may be separated from the stock. Such sprouts should be held down by hooked stakes, and the tops kept in position by a piece of sod."

It will be seen from the foregoing how important a source of wood supply, and of income too in many cases, the gradual and judicious removal of the larger trees, and the careful and intelligent cultivation of a second growth may become. If in clearing up land a strip or belt of timber were left on the north and west sides of every ten or twenty acre lot, and intelligently handled in the way suggested, not only would a very excellent wind-break be maintained, but the farm would yield two crops annually in place of one, with very little loss of space, and with, probably, a gain rather than a loss in the value of the grain crops.

Preservation of Standing Timber on Farms.

The usual treatment of the standing timber on a farm, unless cleared to be used as a grove, or where it consists wholly of sugar maples, is unscientific and wasteful to the last degree. Its final disappearance is looked upon as inevitable,

and the process of chopping and clearing mows it down as surely and steadily if not quite so rapidly as a reaper the field of grain. Now, in most cases, by selection and good judgment, the bush may be saved, and enough timber for all useful purposes still obtained. In a very interesting and comprehensive letter to the Commissioners, the Hon. George W. Allan, of Toronto, alludes to this particular matter.

He says :—

"And here let me remark in passing, that, in this country, where tree growth is so rapid, if every farmer who has not been so recklessly improvident as to leave himself without a few acres of bush on his farm, would only manage his bit of woodland, be it twenty, fifteen, or even ten acres only, carefully and systematically, it would keep him, and his children after him, supplied with fuel, and to a great extent with timber for fencing and repairs on the farm.

"I have known instances of pieces of woodland of from twenty to twenty-five acres in extent, which have been thus systematically cut now for twenty years and upwards; no tree under a certain diameter was allowed to be touched; all the young growth of beech, oak, maple, elm, etc., was carefully protected; and the result has been that these comparatively small reserves have continued to furnish, under the same management, sufficient firewood for the wants of their owners, as well as much useful material for repairing fence, gates, and out-buildings.

"On many farms in Ontario, however, not an acre of wood is now left, and on many more, the small reserves are rapidly dwindling away, so that planting would seem to be the only means of providing—at least in country districts—a supply of firewood for the future, unless our farmers are to burn coal, and become dependent in a great measure for their fuel on a foreign country."

By selecting (1) such trees as are in demand for mechanical purposes, and (2) those of an inferior class, for fuel; carefully cleaning up all mere rubbish, and encouraging the development of seedlings and second growth by judicious thinning, the timber crop will be literally perennial. Where too, it is necessary to clear, belts, or clumps of second growth, may be profitably left to form shelter belts in the first instance, and timber-yielding plantations in due course. In the course of his address to the Commissioners, Prof Buckland mentioned a little incident within his experience, bearing on the last suggestion. He said :—

"The question of raising trees from second growth is a practical one, and I am aware of at least one instance in which the plan was successful. About thirty years ago I was staying a few days with a farmer in Prince Edward County, who was clearing up eight or ten acres of bush and burning it. Three or four acres were covered with second growth maple, and I persuaded him to leave that for the purposes of a sugar bush. He did so, and now it is one of the most beautiful little sugar bushes you can find in Ontario. This, of course, could only be done where the maple is the predominant wood."

Puget Sound Fir-Trees.

The fir-tree growths of Puget Sound form one of the wonders of the American world. They average 200 feet in height, and some specimens have been cut that measured 320 feet in length and twelve feet in diameter at the base, with a straight and well-proportioned log length of ninety feet to the first limb. The cedar trees are in like proportion and are most valuable for wooden wares of all kinds, while the firs are the best for spar and ship timber yet found in any country. There are few nations that do not use them in ship-building. One fourth the wealth of San Francisco was culled from the firs of Puget Sound while the Government slept, and to-day all the principal steam mill owners who saw and prepare for market from 100 to 200,000 feet a day to each mill—and there are thirty or more mills—are residents of San Francisco, where they invest their profits, to the great injury of residents of the Sound. There is, apparently, no exhaustion of the timber, and a century will possibly elapse before Puget Sound forests will be cleared of their immense resources of varied tree growths.

ONTARIO WOODLANDS.

THE UNCLEARED LANDS IN THE OLDER PARTS OF ONTARIO.

Among other informafion placed before the public for the first time by the report of the Agricultural Commission is a mass of statistics relating to the state of the land in every township in the Province. From these figures we are able to learn exactly how far the work of deforesting the country has actually gone, and how much further it is likely to proceed before a stable ratio between the cleared and forest land is reached. We have compiled, from the digest by counties of the township reports, a table showing the total area of each country and the area of cleared land therein, and have calculated the percentage of land which is still under forest. Bearing in mind the frequent outcry about the destruction of our woodlands, it may be anticipated that the first thing to strike the reader will be the great number of acres still uncleared. even in such old and densely settled countries as those of York and Middlesex.

ACREAGE OF ONTARIO COUNTILS, NUMBER OF CLEARED ACRES, AND PERCENTAGE OF UNCLEARED LANDS.

Wentworth	272,190	197,586	27
York	540,271	392,513	28

It will be observed that in only two counties —Peel and Brant—is there less than 26 per cent of the land still in forest. Of counties still possessing more than a quarter and less than a third of bush land there are nine—Durham, Haldimand, Halton, Lincoln, Oxford, Prince Edward, Waterloo, Wentworth, and York. In twelve counties the bush land is more than one-third and less than one-half of the total area, namely, in Northumberland, Elgin, Huron, Leeds and Grenville, Middlesex, Norfolk, Ontario, Perth, Peterborough, Dundas, Welland, and Wellington. The following counties have more than a half and less than three-quarters of their lands still in forest :—Bruce, Carleton. Essex, Frontenac, Grey, Hastings, Kent, Lambton, Lanark, Lennox, Prescott, Stormont, Glengarry, Victoria. And the following have more than three-quarters of their forests still standing :—Addington, Renfrew.

We have some recollection that a French Commission on forestry reported, after a careful investigation, that one-sixth of the whole face of the country shall be clothed in forests in order to secure favorable conditions for agriculture. Bearing on the same point we may mention the fact that any farmer of a hundred acres of good land in Ontario who has ten acres in bush considers that an ample allowance. According to this, none of our counties have as yet approached alarmingly near the point of danger, and it is to be hoped that in those counties which are nearest exhaustion, the reckless waste of the early days will not be practised hereafter. The trouble with our farmers is that the forests which are still standing are not by any means evenly distributed. There are hundreds of farms so stripped of wood that the owners have to purchase fuel. The condition of these farms ought to be, and probably will be, a sufficiently impressive example to deter the owners of woodlands from further lavishing of their resources.—*Globe.*

THE INDUSTRIAL CONDITION OF CANADA.

A couple of years ago our Canadian neighbors, tired of the industrial stagnation, adopted a protective tariff in the hope of developing home industries. A return to a free policy is strenuously insisted upon by many Canadians, whose idea of national economy never rises above the sophistry of "buying in the cheapest market."

In an argument for the policy now under trial the *Industrial World* of Montreal describes a very hopeful state of things as its first fruits, and points out the obvious conditions of the new prosperity :—

"Suppose, for instance, a factory is opened in Montreal, giving employment to 1,000 hands, what does this mean? One thousand factory employees will represent a population of at least 2,500. What would the closing of this factory and consequent expiration of these craftsmen mean? A loss of 1,000 to 2,500? Much more. These artisans require boots, shoes hats, caps, meat, bread, roots, vegetables, medicine, clothing, houses, wood, etc., almost *ad infinitum*, and likewise each of the new or additional industries which they inaugurate to add to in all its various forms, require the same things. So that each thousand artisans probably adds, in one way or other, 5,000 additional to the population. Have our free trade friends ever considered this? What emptied one-fifth of the houses of Montreal under the late regime? The closing of the factories. What studed the growth of the city during that dark era? The impediments which the tariff raised to the establishment of new industries and the development of diversified labor. All the artisans employed in the factories of the metropolis wanted homes. It required carpenters, joiners, bricklayers, painters, plasters, roffers, glaziers, workingmen of all kinds to erect these houses. It required vast quantities of agricultural produce to fill the stomachs of the various craftsmen which the tariff furnished with a purchasing power. And although to-day the same clouds float over us, the same sun, moon, and stars light the heavens by day and night, in the language of Webster, How altered! and how changed! Of 2,000 notes falling due on the 3rd of February in the Bank of Montreal, not one was protested!! Among the thousands of vacant houses in Montreal in '78, not an empty place is to be found, and the demand is for hundreds more. The market is flooded with money for investment. Canada fours are worth more than Canada sixes were formerly. Our alms houses, except for the old and infirm, are empty, and the soup kitchen is now a matter of history. The railways are unable to carry the freight offered to them, and the demand for increased accommodation is met by the employment of thousands of able hands, working night and day to meet the public wants! Never was there an era promising greater prosperity for Canada. Bank stocks have appreciated 37½ per cent, and all securities have become correspondingly improved in value, and the prospect of a £5,000,000 surplus for the financial year ending July 1st stares us in the face to terrify us into a free trade policy! If it is a bad policy to swamp horses while crossing the stream, we think it would be rather imprudent to risk a change from prosperity, under protection, to one of promised increased (?) aggrandizement under free trade."—*Scientific American.*

Effects of Advertising.

Mr. Alsop, of the Steam Cabinet Works. Broadmead, Bristol, has just executed a furnishing order for South Africa. The sender admitted that he had only heard of Mr. Alsop through the columns of an English newspaper.

SUPERIOR QUALITY OF SAW LOGS.

A "Traveller" writes to the Pembrooke *Observer* as follows :—

"In passing round by the Schyan the other day I could not help remarking the quantity and quality of saw logs manufactured by the Messrs. Bronson & Weston on that stream, and never was I more surprised than when observing those logs which are large and of the very best quality, being of the finest yellow pine. As a great many of them are taken out by jobbers and culled on the river, it is a good sign to see so little red chalk, which indicates culls, and deals out destruction to the jobbers. I opine it did not cost the company much this year for crayons. The reason my attention was more particularly drawn to these logs was that the limits from which they were taken belonged to the late John Egan. After his death their working was carried on by trustees, they were pronounced by the agent to be of little value, and were sold by public sale and knocked down to the company for a mere trifle. Alas for men's judgment in these days. I have been informed that the Messrs. Bronson & Weston will have about one hundred thousand logs taken from their Schyan limits this winter, part of which will go down by Black River. I did not see all their logs but was told they were all of A 1 class. I can safely say the Schyan river will produce more first-class logs in proportion to quantity than any tributary of the Ottawa. I must not forget in passing, that Mr. Richard Fraser, of Pembroke, has a few thousand logs near the mouth of the Schyan which are well worthy the attention of intending purchasers, as I understand they are for sale, they are a fair average and good quality. On my arriving at the mouth of Schyan I could not help taking notice of the improvement being made on Capt. Thibeaudeau's screw steamer, the *Walter B.* He is getting her renovated and enlarging the first and second deck. This will have ample room to accommodate the travelling public the ensuing summer and autumn. There is an appearance of prosperity over all parts of this section. I see Wm. Leroy's wharf is well filled with wood, I believe for the use of the Union Forwarding Company's steamers; it looks encouraging to see all these preparations making for the next summer's business. With a railroad running along side, it is surprising to see all the teams that are drawing up loading for the Upper Ottawa. I could not help thinking there must be something wrong. Do they charge too much for freight on the Canada Central? All the better for the farmers and hotel-keepers along the road."

THE EASTERN TOWNSHIPS.

Lumbering interests in the Eastern Townships of Quebec are this winter very brisk. Especially is this the case along the line of the South Eastern R.R., which, with its several branch lines, has done much to open up sections of the country containing large quantities of spruce and hemlock standing timber, which have heretofore been unavailable. A Montreal correspondent who has just spent several days in the township of Roxton, reports lumbering operations in that vicinity as being very actively prosecuted. There are large tracts of land there covered with hemlock, which has heretofore been cut solely for the sake of the bark for tanning purposes. Thousands of trees lay rotting in the bush, but since the completion of the railway between Sutton Junction and Sorel, which affords direct access to the American market, all the available timber lands have been bought up. Messrs. Prouty & Miller, a considerable lumbering firm, of Newport, Vermont, have built a fine mill at Roxton Falls; Messrs. Cosgrain & Lee, who hold some 4,000 acres of timber land, expect to get their new steam mill running in a week or so, and have already sold all their cut hemlock to a North Troy, N.Y., concern. Three or four other mills are in course of erection in the same neighborhood, and the general business activity prevailing is in marked contrast with the state of affairs which existed a few years back, when railway facilities were wanting.—*Monetary Times.*

A PROMINENT lumberman in Burlington has had his coat of arms painted on the panels of his carriage with the Latin motto "Vidi," which by interpretation is "I saw."

THE FUEL OF THE FUTURE.

THE DISCOVERY AGAIN CLAIMED—WHAT IS SAID ABOUT ATOMIZED PETROLEUM AND SUPER-HEATED STEAM.

Reports current among engineers and others interested for some months past were only the prelude to disclosures which must excite the industrial world. The main fact is the production of a new fuel, from the combination of petroleum and steam, from which intense heat is instantly generated, under perfect control, and at an expense so insignificant, compared with coal, as to promise results of an importance not easily exaggerated. This is the conviction of all present to-day who witnessed its practical operation at the smelting works of G. D. Mackey, in Grand street, Jersey City, where he has had liquid fuel in use for a considerable time, but meanwhile avoiding observation. The explanation of the methods and principles was volunteered by Colonel John C. Rose, of the Pennsylvania Railroad Company. But the simplicity of the arrangement was not the least remarkable of the whole. To produce combustion, nothing more is necessary than

BY MEANS OF AN ATOMIZER

to unite dry steam and crude petroleum, only a common inch pipe being used for this purpose, one for steam, the other for oil, with cocks to regulate the flow. The junction is made within six inches of a perforated brick retort, which the nozzle enters, and instantly, on a match being applied, the whole interior of the furnace (an ordinary reverberatory smelting furnace) becomes intensely heated, so much so that all the exposed surfaces may be easily fused. If applied to a steam boiler, on a locomotive, or on shipboard, it is only necessary to place the retorts, made of fire clay, on the grate bars, thus protecting the boiler plates from injury. Said Colonel Rose: "We can now run a locomotive from New York to Phiiadelphia for four dollars instead of an expense of some $25, as at present, with coal." More than this, the fuel creates no gas, smoke, ashes or cinders—in corroboration of which statement the spectators were asked to observe the interior of the furnace and the opening of the flue above the roof. Mr. Mackey reminded the spectators of what liquid fuel might do for the elevated railways, and of the revolution to be affected in steam navigation. Said he: "We have the system in perfect working in a boiler at the Jersey City water-works in Belleville, and have demonstrated more than what we have said to be true." "Why," said he, "we have only to make a retort full of holes, where the gas is generated, and placing it on the grate bars of any furnance nothing else is required but to turn on the steam and oil, or as for that matter, coal tar or the refuse of an oil efinery will do just as well, and one fireman can tend to a dozen furnaces just as easy as one, for all he has to do is to keep up steam." He affirmed that the new motive power could be used at

ONE-EIGHTH THE COST OF COAL.

Indeed, the cost was so trifling for ordinary purposes as to be too small for easy calculation. The gentlemen present engaged in a general conversation, expresssing themselves in reference to the great changes to take place in running engines and machinery, all seeming to be firm in the faith that great results are in the immediate future.

Mr. McCrae, superintendent of the motive power on the Pennsylvania railroad, said immediately: "This is just the thing we want and have been long trying for." The only difficulty heretofore has been in the combustion—in the mode of applying the fuel. On the New Jersey Midland railroad, not long ago, they thought they had the right thing beyond a doubt, and went so far as to organize a company, with $2,000,000, to apply it, but the plan did not work. Several of the steamship lines, too, have tried it, with no better success. The atomizing process, however, with super-heated steam in combination, is accepted as the true solution of the difficulty. It is observed that the dryer the steam the greater is the power, and so the present purpose is to turn the pipes supplying steam directly through the furnace, so that the combination with the oil shall take place after the steam has been heated to the highest degree attainable. As yet the mechanicism employed is of a very crude character, but is susceptible of a perfection which shall set at rest all questions concerning the feasibility of a practical application.—*N. Y. Commercial Advertiser.*

THE CHICAGO LUMBER TRADE.

At the recent meeting of the lumber dealers of Chicago, B. L. Anderson gave the following resume of the lumber trade of that city during the past 20 years, with some sensible deductions therefrom:—

"Lumbermen of 1881, what is our duty at this time? To rightly understand and appreciate the true condition of our trade. To do this, facts must be ascertained, and after we have made the correct deductions therefrom, it is our duty to outline and follow the policy that shall most surely remunerate us for the investment of our time and capital. Facts and figures, I am aware, are rather dry food so soon after lunch; but it is for our present and prospective good to look at a few of them. From 1861 to 1865 the average receipts were 425,000,000 feet, and the average stocks on hand Jan. 1, 86,000,000; from '66 to '70, the average receipts were 931,000,000, and the stocks 215,000,000: from '71 to 75, the receipts averaged 1,110,000,000, and the stocks 306,000,000, and from 1876 to 1880, the receipts were 1,263,000,000, and the stocks 394,000,000. In 1860, the total receipts were 262,000,000 feet, and the stock on hand Jan. 1, 1861, 36¼ per cent., or 94,000,000 feet; in '65 the receipts were 647,000,000, and the stock on hand Jan. 1, '66, 137,000,000, or 21¼ per cent.; in 1870, the receipts were 1,018,000,000, and the stock at the end of the year, 298,000,000, being 34 per cent. of the receipts; in 1875 the receipts were 1,147,000,000, the stock 352,000,000, and the percentage 30½; and in 1880, the receipts were 1,564,000,000, the stock at the close 497,000,000, and the percentage 32. Prior to 1876, there were no monthly accounts taken of the stock in the yards, and I cannot, therefore, show the average percentage during the year, before that time. In 1876, however, we find that, with receipts aggregating 1,039,000,000 feet, the average stocks, as shown by the inventories taken on the first of each month, were 303,000,000, or 30 per cent., while the stock on hand Jan. 1, was 352,000,000, or 33¾ per cent. of the receipts; in '77 the receipts were 1,065,000,000, the average monthly stocks 305,000,000, or 30 per cent., and the stock Jan. 1, 369,000,000 or 34½ per cent.; in '78, the receipts were 1,180,000,000, the monthly stocks 333,000,000, or 28½ per cent., and the amount on hand Jan. 1, 385,000,000, or 32½ per cent. of the receipts; in '79, the receipts were 1,468,000,000, the average stocks 407,000,000, or 27¾ per cent., and the 1st of January stock 410,000,000, or 28 per cent., and in 1880, with receipts of 1,564,000,000, the monthly average of stock was 404,000,000, or 25 per cent., and the amount on hand Jan. 1, 451,000,000, or 28½ per cent. of the total received.

"To appreciate correctly these figures, there is one very important element to be borne in mind; namely, that previous to 1876 considerably more than 50 per cent. of our receipts were shipped green from our yards and railroad docks, whilst now, 25 per cent. of green shipments would be a very liberal amount to estimate. My own opinion, however, is that from 15 to 20 per cent. of green shipments is more nearly the correct amount, which fact, of itself, necessitates a largely increased stock of dry lumber, over and above what the yards have carried hitherto. Hence, in view of the receipts of 1880 being 1,564,000,000, I estimate that we ought to have had on hand on Jan. 1, a stock of not less than 600,000,000, taking into consideration the largely increased demand of 1880 and the prospective demand for 1881,; instead of which, all we had on hand Jan. 1 was 497,000,000—fully 20 per cent. less than we ought to have had. Hence arises the unwisdom of any alarm about the stock on hand being excessive.

"The fact is, if we want to hold the trade we have acquired, and increase it, we must of necessity have a largely increased stock of dry lumber all the time on hand for shipping to points where we come into direct competition for the trade of those points. Which of these policies we shall pursue will determine whether we are as wise in our day and generation as our worthy predecessors were in theirs."—*Lumberman's Gazette.*

LOSSES BY FOREST FIRES.

We some time ago stated that the Superintendent of the Census had placed all that relates to Forestry, including lumbering, and whatever concerns forestry as a source of national wealth, in the hands of Prof. C. S. Sargent, of the Arnold Arboertum of Harvard University. How thorough his investigations would be, those who know him need not be told. In a general way we may say that his own journeys to the Rocky Mountains and to the Pacific, as far as the forests of Washington territory, his employing of local agents, and the sending of experts to important localities, have been but a part of his labors. To show how every ramification of the subject is provided for, we may refer to the circulars sent out to collect information as to forest fires. We often see articles in the journals lamenting the destruction of our forests by the demand for railroad ties and fuel; the wanton waste in clearing for farms, and the rapid destruction by lumbermen. It is believed, by those best able to judge, that the destruction of our forests by fires, is greater than from all other causes together. It is also known that such fires are annually increasing in number. It is believed that these fires are mainly due from avoidable causes, and that proper legislation is needed to prevent this useless waste of national wealth. For proper measures of prevention to be taken, it is an important point to know just the extent of the evil, and this it is proposed to learn by means of the Tenth Census. Prof. Sargent has prepared a circular to be addressed to the town officers in all parts of the country where forest fires may occur. This blank form, which can be readily filled, asks for the number of acres, or square miles of forests destroyed by fire in 1880, the value of the property thus destroyed; causes generally producing such fires, and any suggestions relating to the general subject of forest fires and how they may be prevented or diminished.—*American Agriculturist.*

FOREST PRESERVATION.

The Brantford *Telegram* says that much has been written lately in reference to the preservation of our forests, but still the reckless waste of fire and axe goes on. Notwithstanding the statutory laws for the prevention of forest fires, there is no effectual check to prevent our valuable forests from being willfully or aceidentally swept away by fire during the dry summer months. The Orillia *Packet*, referring to the subject, calls attention to the scarcity of firewood in some of the older settled townships, which, heavily wooded a few years ago, now, with the exception of their hilly condition and line fences, look like prairiee. Farmers within the radius of twenty miles from cities and large towns are commencing to burn coal, so that the question of fuel supply is a serious one, and will have to be faced within a few years. But apart from this the absence of forests will produce a deleterious effect upon our climate—creating, as the experience of other countries shows, atmospheric changes, anything but beneficial either to the crops or conducive to the comforts of living. We should see to it that at least our tracts of woodlands, which represent thousands of dollars, are not mercilessly left to the incendiary or criminally careless sportsman, but that Forest Rangers be appointed to take charge of our back forests and other non-resident wooded lands, and see to it that in case of fire the flames will not be allowed to devastate, without opposition, vast tracts of country, leaving nothing but a ruined waste. Probably the best plan would be for the Local and Dominion Governments to appoint a joint commission to investigate the subject, and submit proper regulations on Forestry in general.

Got Up in the Very Best Style of the Art.

We have to thank the publishers, Messrs. Toker & Co., of the Peterborough REVIEW, for a specimen number of THE CANADA LUMBERMAN, hitherto published at Toronto, by Mr. Alex. Begg. It is got up in the very best style of the art, and speaks most favorably for the enterprise of its new proprietors. Published semi-monthly, at $2 a year; 16 pages. The only work of its kind published in the Dominion. In our next we purpose giving extracts from its "Introductory" articles, which will more fully explain its mission.—*Millbrook Messenger.*

TIMBER RESOURCES

The forestry division of the Department of Agriculture, national Government, has been engaged in attempting to ascertain the timber resources of the country, in connection with the tenth United States census. The work in the States of Michigan, Wisconsin and Minnesota, has been under the supervision of H. C. Putman, of Eau Claire, Wis., whose researches have so far progressed that an approximate estimate of the amount of standing pine in the three States has been reached. From what we learn of the method pursued in obtaining the figures it is judged that the result will be a nearer approach to a knowledge of the actual timber resources of the country than has ever before been obtained. To be sure, there has been a reliance upon estimates, but they have been more closely scanned and compared and have gone more into particulars. The results secured in the three States named are these:

Minnesota will be credited in the census reports with containing 6,150,000,000 feet of standing pine, distributed as follows: Rainy Lake and tributaries, 350,000,000; Red River and tributaries, 600,000,000; St. Louis and Cloquet rivers, 1,500,000,000; Mississippi and tributaries, 2,900,000,000; North Shore of Lake Superior, 800,000,000.

The State of Wisconsin is credited with 40,500,000,000 feet, distributed in districts as follows: St. Croix river and south shore of Lake Superior, 6,000,000,000: Chippewa and tributaries, 12,500,000,000; Wisconsin and tributaries, 11,000,000,000: Lake Superior district east of range 11, 2,000,000,000: east of the Wisconsin river, 9,000,000,000.

Michigan is credited with having 35,000,000,000 feet of standing pine—6,000,000,000 in the upper peninsula and 29,000,000,000 in the lower peninsula.

The aggregate in the three States is 81,650,000,000 feet.

This is much less than the amount of pine supposed to be standing in these States, but there is no means of ascertaining whether the figures given include only the bodies of pine which in the present condition of lumbering operations are regarded as profitable to lumber, omitting lands which have been culled but which still contain a considerable amount of pine which will eventually be cut, when the decadence of timber shall sufficiently advance the price of lumber.

There is quite a probability that there will be a goodly quantity of pine cut in the three States after the reports show the 81,650,000,000 feet of the census bureau's finding have been manufactured, which will be in about 11 years at the present rate of cutting.

At the present rate of cutting the pine in Michigan will last 10 years, if the figures above given are proper representatives of the amount now standing.—*Lumberman's Gazette.*

Important Function to Fulfil.

THE CANADA LUMBERMAN.—We have received from Messrs. Toker & Co., Peterborough, a copy of this semi-monthly published by them. It is a sixteen page quarto, and its typographical appearance and make-up are exceedingly neat, such as one would expect the REVIEW establishment to turn out. The prospectus announces that the LUMBERMAN will be a "purely trade organ and entirely non-political." "All information of value to the trade at large will be diligently collected and matters of interest to them will be discussed and advocated." And judging by the number before us this promise will be faithfully carried out. This journal as the guardian of one of the most extensive interests of the Dominion has a most important function to fulfil and the promise of the initial numbers is a good indication that this importa duty will not suffer at the hands of THE CANAD LUMBERMAN. The single number before us appears for its varied and interesting contents to be worth the price of subscription ($2.00) for a year to anyone to whose interests they appertain We give it our best wishes for success.—*Napanee Standard.*

THERE are now six European countries whic refuse to allow the importation of pork from the United States, viz.: Russia, Italy, Spain Portugal, Greece and France.

Chips.

In Chicago 3,411 men find employment in the lumber yards, and 2,761 men and 265 boys in the planing-mills.

During January and February, 9,597,043 feet of lumber were exported from New York, the West Indies taking fully half of it.

A cord of second-growth, dry oak wood, by actual test, weighs, 2,948 pounds, and a load of green, of the same kind, 4,820 pounds.

It is said that it will crowd the mills of Orange and Beaumont, Texas, to fully meet the demands even of the railroads this year.

The Muskoka *Herald* says: The Muskoka Slide, Dam and Boom Company will build a new dam at the falls at Baysville during this season. The company's engineer was taking levels and making measurements for the work last week.

Mr. Arthur S. Pierson, of Harvard, N.Y., has patented a jointer for circular saws, so constructed that it can be readily adjusted to operate on saws of different diameters, and which will bring all the teeth to a uniform length. It is an ingenious, simple, and effective device.

The Flos Lumber Company have erected a new saw and shingle mill of large capacity, not far from the Midland Railway station at Orillia, and already two boilers and machinery are forward, the intention being to have the mill ready for work at an early day on the large stock of logs cut during the winter.

The official figures for 1880 show that the exports of the United States have increased to the enormous amount of $889,649,840, exceeding 1879 by $124,490,015. The imports have increased largely, yet there still remains an excess of exports over imports of $192,846,407—or nearly two hundred million dollars for 1880.

A despatch announces that a Minneapolis firm has secured a large order from the Syndicate for lumber for the construction of the Canadian Pacific Railway freight-sheds and depots on the line. It is stated also that 600,000 ties, manufactured on the eastern ssection of the C.P.R., have been bought at reasonable figures.

The Muskoka *Herald* says Mr. T. Halliday is at work with a gang of men improving the navigation (logivation) at Mathiase Falls, by building a pier opposite the one built by the Government four years ago. The present improvement is being done by the Muskoka Slide, Dam and Boom Company, and, if properly carried out will be a great boom to river drivers.

The Fredericton *Reporter* says the people of Quebec are beginning to wake up to the great waste of the hemlock trees, in procuring bark for exportation. The hemlock tree will be a thing of the past in New Brunswick before long, unless some restriction is made. The suggestion to increase the stumpage tax on bark cut for other than local tanning or extract purposes, is a good one.

The Tracadie *Star* says there has been, or will have been by spring, nearly 8,000,000 feet of logs cut on Tracadie this winter. It is principally for R. A. & J. Stewart, and will be sawed at the Tracadie Mills, and thence conveyed to Chatham in woodboats. Mr. J. A. McDonald has now put out 3,500,000 feet on the South Branch of Tracadie, has 13 teams and 90 men in, and works for Stewart.

The Ottawa *Free Press* says that Capt. W. O. McKay informs us that Dosithe Galipaux, Joseph Galipaux, Orphir Philon, and Hermidas Desmarchis, four men in the employ of Mr. A. McLean, cut 155 pieces of square timber on the Upper Ottawa in six days. The timber averaged 54 feet. This is claimed to be the biggest week's work ever performed by four men in the Ottawa Valley.

The Quebec *Chronicle* says the Canada Central Railroad is to blame for the failure of timber merchants to ship timber through to Quebec by rail. It says that line charges more than double the rates of the Q.M.O. & O. Railway, and that Mr. Chapleau has been endeavoring at Ottawa to bring about such a reduction in the rates of the Canada Central as will enable the Q.M.O. & O. Railway to assist in the development of this important traffic.

The Bangor (Me.) *Whig* of the 2nd of March says, that at the annual meeting of the Penobscot Lumbering Association, held yesterday, the following officers were elected: Presldent, W. B. Hayford; Clerk and Treasurer, Abram Moor. Directors, Charles G. Sterns; Joab W. Palmer, Eben Webster, John Morrison, John P. Webber and Jos. M. Hodgkins. The rafting of the logs at the Penobscot boom for the coming season was bid off by Mr. John Ross at the rate of thirty cents.

A scaler in a lumber camp in Gladwin county was instructed to scale out both saps on certain logs. One of the kind was banked which the foreman thought ought to scale 500 feet. The scaler insisted, though, on following directions and scaled out the saps. Later he went around to the other end of the log and discovered it was hollow, and when last heard from he was sitting on a stump scratching his head, for after taking out the hole he wanted just 13 feet of having any log at all.

The Renfrew *Mercury* says that on the limits lately sold by Messrs. Mackay & Smith, there has been cut this season one tree, five lengths of which (each 13 feet 6 inches long) measured one hundred and fifteen standards, and said to contain 23,000 feet of lumber. The smallest end of the smallest log measured 35 inches in diameter. From another tree, a piece of timber 44 feet long by 3 feet square was manufactured. The stump of this tree measured 18 feet in circumference. This limit is within a day's drive of Renfrew village.

The Pembroke *Observer* says that Mr. P. Fitzpatrick, Mayor of Allumette Island, who has the contract of drawing a raft of timber, manufactured on the Coulonge by Bryson & Murtagh, for J. R. Booth, has caught up to the timber makers, and has now between one thousand four hundred and one thousand five hundred pieces conveyed from the bush and deposited on the ice. According to Mr. William Clarke, forest ranger, of Pontiac, the timber will average between sixty-five and seventy feet, and he says it is the best he has seen this winter. The distance which the timber had to be drawn varied from six to eight miles. It is now lying on the Coulonge river, some seven or eight miles above its junction with the Ottawa, and consequently about the same distance from Coulonge village. If the season permits, about seven hundred pieces will be manufactured and added to the timber already drawn.

It is believed that the railroad tie of the future will be cut from the beautiful catalpa tree. The Fort Scott, Texas and Gulf Railroad have planted 900 acres of young trees and the Iron Mountain railroad 100 acres, near Charleston, Mo. On the track bed of the latter company ties of this wood have lain in the muddy silt of the Mississippi for twelve years, and are still in a good state of preservation. They have outlasted two sets of white oak ties, and bid fair to survive the third. Fence posts in Indiana and Illinois are now sound after having been in service for forty, fifty and even seventy-five years. In the muddy regions about Cairo, where it is grown extensively, it is used as "corner stones" for the most substantial buildings. It is of an elastic nature, but not so soft and light as cottonwood. Dr. John A. Warder, President of the American Forestry Association, claims for the catalpa a durablility and power of resistance to the influences of the elements possessed by no other wood. It is found in the Mississippi valley and on the shores of the tributaries of the great river. It bears a large white, highly perfumed flower, and grows quite rapidly.

Deserving of Liberal Support.

The Canada Lumberman.—This journal, the first nine numbers of which were published in Toronto, has been purchased by Messrs. Toker & Co., proprietors of the Peterborough Review. The Canada Lumberman is the only paper published in Canada devoted to the interests of the lumber and timber industries of the Dominion, and being purely a trade publication, is deserving of a liberal support from those in whose interest it has been established. The first number issued by the new proprietors is before us, and is in every respect a credit to them. It is published semi-monthly at $2 per annum.—*Belleville Intelligencer.*

THE DRY LUMBER QUESTION.

At the meeting of the Chicago lumber dealers on Saturday of last week, in response to a resolution of thanks, extended to Mr. T. W. Harvey, who officiated as the host, that gentleman made some very sensible remarks upon the relation of the Chicago lumber trade to that of the country at large. "Chicago," said Mr. Harvey, "makes prices for the entire western country, and the markets of the East are influenced by the action of the dealers of this city in fixing the value of lumber. The qnestion of carrying larger stocks is one which must materially affect the prices of the future. If this market fixes its prices upon the basis of green or but partially seasoned lumber, as must inevitably be the case if the yards of the city do not carry stocks of sufficient extent to at all times insure a full assortment of dry, the markets at other points will be established upon the same basis. The extent of the trade which Chicago shall transact during the coming year, hinges largely upon this question. The total supply, of the year 1879, amounted to 1,850,000,000 feet, of which, in round numbers, 1,400,000,000 feet was disposed of, and the close of the year found us with about 450,000,000 feet on hand. The stock of 1880 aggregated 2,000,000,000 feet, of which 1,500,000,000 feet was sold, and 500,000,000 feet remained on hand for commencing the business of the present year.

"Every indication now points to an increase of not less than 150,000,000 feet in the business of 1881, and we should prepare ourselves for handling not less than 2,250,000,000 feet, including the stook now on hand. This will admit of a disposition, during the season, of 1,650,000,000 feet, leaving on hand, at the close of the season, 600,000,000 feet. That this will not more thau suffice for the wants of the trade, our present condition fully assures us. Entering upon the year with 500,000,000 feet, the first of July will find our dry stocks so far depleted as seriously to cripple our trade for the succeeding three months. We should have closed the last season with at least 100,000,000 feet more than we did, in order to keep ourselves in position to supply the prospective demand which is now indicated.

"And the trade is rapidly increasing. The rapid development of the western country admonishes us that if we would keep pace with it, we must enlarge ou stocks. If we are called upon to receive such a vast amount as 1,750,000,000 feet during the coming season, and the prospect of the winter's logging assures us that we shall be, where shall we sent the 1,650,000,000 feet which I claim we shall be able to dispose of? In answer to this, let me point you to the 10,000 miles of railroad now in course of construction, and call to mind the growth and increase of the towns and villages which are building up as a result of the wonderful era of prosperity which has dawned upon us. And if the country west of us will so largely increase its demands for lumber, what shall we say for Chicago? At no time in the past six years, have so many plans been supplied by the architects of this city for improvements as are now in hand.

"And all this means a demand for dry lumber. We cannot ship it green. The day when 10,000 feet could be loaded on a car and billed as 5,000, has gone by. Everything is weighed, and the lumber manufacturers and dealers of the whole country are in the same boat; all must submit to the weighing process. There may in the past have been a "buy" way, but that is out of the way for us and for a majority of dealers elsewhere. Pools have been formed; all the railroads of the country have become members of what is known as a weighing association, and the pool association has agreed to haul no lumber which has not passed over the scales of the weighing association. This does not apply simply to shipments from Chicago; it includes not only lumber, but everything else, not only here, but everywhere throughout the land.

"Let us, then, see how we are to be affected by it. The average stock of lumber in Chicago will weigh 3,200 pounds to the thousand feet. The average freight is 25 cents per 100 pounds. Dry lumber will average not over 2,500 pounds. If, then, we dry 700 pounds of water out of the lumber, we reduce the freight $1.75 per thousand feet. Lumber weighing but 2,500 pounds is worth fully $1.25 more in our yards than lumber weighing 3,200. By carrying sufficient stock to enable us to season it, we add, therefore, $3.00 per thousand to its value to us. Will not this pay? True, dock rents are high, but the increased value of our lumber will pay the difference of expense in this respect and still leave us a handsome margin, beside enabling us to fill the orders which reach us, with promptness. The manufacturers also must learn to carry a supply at their mills, and thus to share with us in the benefits of cheaper freight and a better price. Dry lumber is what we want, and dry lumber we must have, and we must make up our minds this very season to place ourselves in a position to at all times have it.—*Northwestern Lumberman,*

CANADIAN AND BRAZILIAN TRADE.

The ventilation of the proposed new trade between Canada and the Brazils has so far been in a dormant state as regards practical statistics for the guidance of our commercial and trading community. The *data* relative to this subject has been compulsorily held in abeyance awaiting the consummation of arrangements by Mr. Wm. Darley Bentley (the Brazilian Consul-General) who, since October last, has been vigorously engaged in England and Rio Janeiro conferring with financiers and shipowners for the bringing about of a company to conduct direct service between the two countries. We are enabled on good authority to state that that gentleman's negotiations have been successful, and a company has been formed in London, England, whereby a first-class line of steamships will, almost immediately, come into operation, commencing probably between Halifax and Rio, and performing a bi-monthly trade. The company's capital is stated at $500,000, which, together with the respective subsidies of 850,000 voted by the Canadian and Brazilian Governments, will enable the service to provide such comfort to passengers and freights as, in the past, has not been provided. The prospects of an increasing trade between the Dominion and the Brazils is encouraging to all parties interested; and at once opens up a new channel for shippers to consign marketable produce to more distant ports, where, probably, the field for requirements will enhance the value and more than fully repay the consignor for his speculation. On the other hand, we have exceptional transit offered for Brazilian produce imported into Canada, giving Brazilian exporters facilities for shipment of tropical goods such as sugar, coffee, cocoa, hides, etc., and various articles of farina indispensible in our markets. The specialities of exports to the Brazils include flour, furniture, coal, codfish, dry goods, all descriptions of canned goods (meat and fish), kerosene and petroleum oils, pine wood and lumber in every shape for building purposes. In fact, the interchange of commodities are so numerous that a glance at the import and export trade during the past two years between the United States and Brazil at once implies that similar transactions are adapted to Canadian and South American requirements. It is the company's intention to make one of the West India Islands (perhaps St. Thomas) a port to call *en route*—whereby their interests and the public convenience will be further developed. The rates proposed to be exercised by this service will be of such quotations as to render attractions to shippers, and provide opportunity for consignments of saleable articles to receive the attention of consignees at their destination. The necessity of this service between Canada and the Brazils has long been recognized, and, now that it has arrived at the present satisfactory point for practical work, there is every reason to believe that its merits will be fully entertained by the travelling and commercial community, and ultimately establish such benefits as its promoters and Government supporters have so ably organized.—*Industrial World.*

Improvement on the Old Issue.

The Canada Lumberman has changed hands, and is now published by Toker & Co., of the Peterborough Review. The first number published by them, is before us and presents a very neat appearance, being quite an improvement on the old issue. It should receive the patronage of all interested in the lumber business. Terms $2 per year.—*West Durham News.*

IMPORTS AND EXPORTS OF WOOD.

We have received, from the secretary of the treasury, a summary statement of the imports and exports, to and from the United States, for the year 1880, from which some general facts regarding the trade with foreign countries may be obtained. The value of imports of merchandise for the year, free of duty, amounted to $206,583,345, of which the item of unmanufactured wood is stated at a valuation of $3,229,333—an increase in this class of imports of $943,518 over those of 1879. Of dutiable goods, the total imports of the year amounted to a valuation of $490,222,522—an increase over 1879 of $151,362,883. Of this amount, the following table exhibits the value of wood products on which duties were collected :

Articles.	*1880.*	*1879.*
Furniture and manufactures of wood	$1,325,397	$1,010,162
Boards, plank, joist, etc	6,251,335	3,839,535
Shingles	158,485	90,303
Timber, sawed or hewed	14,435	3,043
Other timber	457,950	208,867
Total, dutiable timber imp't's	8,207,602	5,151,910
" non-dutiable	3,229,333	2,285,815
Grand total	$11,436,935	$7,437,725

From the above table it appears that imports of the products of the forest increased in 1880, over the preceding year, to the extent of $3,999,210, or but a fraction less than 54 per cent. But while importing to the extent of $11,436,935 the exports of wood and its manufactures for the year amounted to $17,333,844, against $15,240,743 in 1879, or less than 14 per cent. increase. The following is a detailed statement of the exports included in these figures :

Articles.	*1880.*	*1879.*
Boards, planks, joist, etc	$4,306,429	$4,042,444
Lath, palings, pickets, etc	12,368	13,048
Shingles	180,176	163,612
Box-shooks	193,805	127,562
Other shooks, staves and headings	3,496,528	3,565,035
Hogsheads and barrels, empty	263,485	257,845
All other lumber	1,053,370	643,336
Fire-wood	11,462	9,810
Telegraph and other poles	298,966	442,128
Logs, masts and other whole timber	671,948	637,179
Timber, sawed and hewed	2,592,077	1,742,622
All other timber	123,940	97,337
Household furniture	1,872,589	1,604,279
Woodenware	312,447	298,430
Other manufactures of wood	1,944,274	1,596,076
Total	$17,333,844	$15,240,743

The above includes only the exports of domestic wood products, and to this should be added the exports of foreign goods, imported and again exported, which were as follows. Duty was paid on everything except unmanufactured wood :

Articles.	*1880.*	*1879.*
Wood, unmanufactured, free of duty	$ 79,420	$ 59,610
Furniture and manufactures of wood	65,883	52,430
Boards, plank, joist, etc	450,185	351,907
Shingles	3,438	1,998
Other lumber	5,270	513
Total of both classes	604,196	466,458
Exports of domestic goods	17,333,844	15,240,743
Grand total	$17,938,040	$15,707,201

At the end of the year, there remained in bond, manufactures of wood, boards, plank, joist, scantling, shingles, timber and other lumber, of the value of $289,752, against a valuation of $219,823 at the close of 1879. The lumber represented in the values given above, in the tables of domestic woods exported, comprising the items of boards, clapboads, plank, joist, scantling and deals, amounts to 279,931,000 feet; lath, palings, broom handles, curtain sticks and bed slats, 4,265,000 feet ; shingles, 60,680,000 ; for box and other shooks, no details are given ; sawed and hewed timber figures at 18,425,438 cubic feet, equal to 221,105,256 feet board measure ; hogsheads and empty barrels are stated at 151,337, and firewood at 4,323 cords. The aggregate of the above items of lumber, timber, lath, etc., is 505,301,256 feet board measure, and adding to this the re-exports of foreign manufacture stated at 46,494,000 feet, we arrive at a grand total of exports for the year, of 551,795,256 feet, although 100,000,000 feet more would not exaggerate the extent of the articles of which the quantities are not enumerated.—*North-western Lumberman.*

An English company offers to invest £220,000 in the Jarrah timber business if the South Australian Government will grant reasonable concessions. It is not probable that any definite answer will be given until after the next meeting of the Legislature.

HOW TO DESTROY THE BORER.

James W. Robinson, Esq., of Fremont, Ill., an ex-president of the Illinois State Horticultural Society, gives the following mode of dealing with that destructive insect, the tree borer :

"The eggs are deposited in the bark of the tree, the beetle puncturing or splitting the bark of the tree upward or downward and a little sidewise, the puncture looking very much as if made with an ordinary pocket-knife. The eggs are usually injected into this puncture so deep as to be out of sight ; but not always. On young and thin-barked trees the eggs will be pushed in next to the wood ; but in older and thicker-barked trees they will only be through the hard outer bark and inner soft bark. As soon as the eggs begin to hatch, which is in a few days after being deposited, its enlargement causes the puncture to open, and thereby it is much easier detected. The young borer hatches out in the inner side of the egg, and eats but a circular piece the size of a half dime ; and then starts off, boring upward at first, but sometimes sidewise or downward. At this stage of development it is easy to detect the young depredator by a few drops of discolored juice of the tree exuding from the puncture and sticking on the bark. The larvæ usually bore down below the ground-surface in the winter, and up again in summer, living in the larvæ state in the tree nearly two years ; then boring out in the form of the beetle, ready to repeat their round again. The remedy I have successfully used is to keep the ground around the trunk of the trees clean and mellow, so that there will be no cracks or openings there for beetles to get in to lay their eggs in the tree, and so that the puncture where the eggs are laid or young beetles may be easily seen, and eggs or insects destroyed, which can be done while in the egg by merely pressing firmly on the puncture with a knife-blade (the cracking of the eggs can be heard distinctly), and, if hatched, by cutting away the dead bark over the cavity first eaten out and killing the young worm. The borers do not get into the wood much the first year and can be easily followed by a knife ; but, if not taken out soon after hatching, they seriously injure, if not entirely kill the tree, especially when they run around just under the bark, as they sometimes do. Or, when several borers are in a small tree, they so injure it that it breaks over with the wind. If the ground is well cleared and patted down smooth around the tree about the last of June, the destroying of the eggs and young borers will be more certain. The trees should be examined twice or perhaps three times a year, if the borers are very numeerous, in order that the first hatched may be killed before they do serious injury to the trees. August, September, and October are the months in which to destroy them. They seem to infest certain parts of the orchard from year to year, while others are comparatively exempt. Low grounds have been more infested with me than higher parts of the orchard. A man can usually examine and kill all eggs and borers in five hundred or more trees per day, if the ground has been properly prepared, and no work in any orchard has been so absolutely necessary."—*Ohio Farmer.*

A Store of Useful Information.

Messrs. Toker & Co., of the Peterborough REVIEW, have assumed the publication of THE CANADA LUMBERMAN. It is a sixteen-page quarto, well and neatly printed, and will be devoted to the interest of the great lumbering industry of our country. The LUMBERMAN will advocate the establishment of a Bureau of Woods and Forests in connection with the Provincial Government. There is a store of useful and interesting matter in the first copy issued by Messrs. Toker & Co., and, judging from the success which has attended other publications with which these gentlemen have to do, we may safely predict success to the LUMBERMAN.—*Brampton Conservator.*

THE weather this month has been unfavorable for trade about Philadelphia, Pa., but there has been an activity of sales and inquiries very gratifying under the circumstances. All agree in predicting plenty of business in the near future for both city and country dealers. Prices are well maintained, and we do not think there will be any changes unless on seasoned lumber.

OUR TIMBER SUPPLY.

The *Monetary Times* says :—The question of the extent of the timber supply is relatively a more important one for Canada than for the States. What our remaining supply is, the means of estimating are much less accurate, and it would be well if in connection with the census of this year, special preparation had been made for getting reliable information on the subject. Alarmist stories are started, from time to time, that our timber supply is getting low ; bush fires doing more to denude our forests than the axe of the lumberman. One writer tells us with horror that in removing the forests which protect us from the bleak winds of the Arctic Ocean, we are in danger of letting in eternal winter upon us. Precisely where fact ends and imagination begins, there is no means of knowing. It is, however, about time that an effort should be made to find out the truth. But this is not sufficient. It is essential that every available means be used to put a stop to wanton waste by means of fire. A beginning has been made by the Ontario Government, but the effort is mere tentative and the extent of the means made use of is already known to be insufficient. The forest literature of European countries, respecting which but very little is known here, would furnish many useful hints as to the best means of forest preservation. The subject deserves at the hands of the local governments which are largely interested, more special attention than it has hitherto received.

SHIPPING NOTES.

FREIGHT RATES—INSURANCE—SAILORS' YARNS—NOTES FROM VARIOUS POINTS.

There is no movement yet among vessel men in Toronto harbor in the way of making engagements. It is a certainty that shippers have offered $1.25 per 1,000 on lumber from here to Oswego, but we have not heard of any vessel men having accepted a charter at that rate. On the contrary, they are asking 1.50. Both parties are lying off easily so far, as there is no hurry yet for two weeks or more. About grain rates there is an uncertainty. Shippers say they have been figuring and find that railway rates will leave them about even if they should pay the vessels 2c. from here to Kingston. This will be no better than the rate last year. Nothing can be done with vessel men on such a basis as that with lumber offering at $1.25. Rates on Lake Michigan ports have not been settled exactly, but charters have been made which will give some idea of what may yet be. A prominent shipper in Chicago has determined not to pay more than 6c. on corn to Buffalo, but some agents say they will get 7c., and some vessel men are holding off for 8c. One schooner has been chartered at Milwaukee with corn to Buffalo at 7½c., and another with wheat at 8c. Grain rates from Lake Michigan are expected to be higher than they were last year, but that circumstance will scarcely affect the rates out of Toronto harbor.

INSURANCE.

There is nothing doing of any consequence up to the present. The underwriters will not get fairly into business till the new book is out, or before April. All opinions point to the probability that rates will be higher this spring ; at least that they will open higher. Negotiations are said to have brought out the views that premiums may be in cases one-half to one per cent. higher than they were last year at the opening of navigation. There is no certainty that rates will be sustained at a higher figure, for it is pretty certain that insurance companies will be found outside of any pool combination who will offer better terms.

SAILORS' TALK.

There are no sailors in yet, but vessel captains are gathering round their usual places of rendezvous and exchanging views. These views cover the range of subjects that come up at this season. When the harbor will be open; whether they shall all stand out for "better terms" from shippers ; what sailors' wages will be ; and a strong current of yarns about how they did in wild encounters with ice of fabulous thickness in many past spring times. It is pretty safe to say that the ice in Toronto harbor will not be out of the way much before the first of April, and it will not cause any repining among vessel men if it should be so. The captains all feel pretty sure about getting good paying rates on lumber, and there are said to be plenty of freights just as soon as the vessels can move, so the vessel men are waiting their time with patient assurance. The rating of their vessels in the underwriters' book for 1881 will be looked for with interest by many who do not feel quite sure about the inspector's report. There is not much said yet about the sailors' wages, and it is not yet hinted what the demand will be. There was a good deal of grumbling last year about the rate paid to men before the mast, which was as much towards the close of the season as what was paid to the masters of vessels.

CANADIAN VESSELS AND AMERICAN FREIGHTS.

The Chicago *Tribune* has some observations on the operation of Clause 30 in the Washington Treaty relating to the carrying of American freights in Canadian bottoms. After reciting the regulation that Canadian vessels may carry freight from one American port destined to another American port, provided that a portion of such transit is overland in Canada and in bond, similar regulations being applicable to American vessels with British freights, the *Tribune* says that this agreement is fair [illegible] but the Canadian vessels get a large advantage from its operation, and gives the following figures in demonstration, showing the shipments in transit through Canada to American ports :

Articles.	*Collingwood.*	*Goderich.*	*Port Colborne.*	*Sarnia.*
Wheat, bush	75,385	[illegible]	[illegible]	[illegible]
Corn, bush	1,722,964	[illegible]	[illegible]	[illegible]
Flour, brls	4,582	[illegible]	[illegible]	[illegible]
Cornmeal, brls	3,100	[illegible]	[illegible]	[illegible]
Oatmeal, brls	385	[illegible]	[illegible]	[illegible]
Grass-seed, bags	5,210	[illegible]	[illegible]	[illegible]
Flax-seed, bags	847	[illegible]	[illegible]	[illegible]
Pork, brls	740	[illegible]	[illegible]	[illegible]

Of this quantity American vessels carried 581,898 bushels of corn and 28,285 bushels of wheat, the Canadian vessels getting the other share. So Canadian vessels get over three-fourths of the entire eastern bound freight, which passes overland in Canada during its transit.—*Globe.*

THE new lock and canal at the Sault Ste. Marie will be ready for use about July 1, 1881, with a depth of water at the present stage of sixteen feet. The river has been dredged to sixteen feet for forty miles southward from its head. Now that the final appropriation—$150,000—for the completion of these improvements has been made by Congress, our shipping will have the use of the increased depth of water—sixteen feet—throughout the entire channel between Lake Superior and Lake Huron, in 1881, excepting at two points—Lake George and the East Neebish rapids. The work in Lake George is under contract for completion in 1882. The improvement of the channel at the East Neebish rapids has been in the hands of the Government of the Dominion of Canada.

STEAMBOAT masters, mates, and engineers in the United States pay $10 every spring for their certificates. There is a sum of $300,000 to the credit of the Steamboat Inspection Service now, but fees are kept up.

THE schooner *Wanderer*, lying at Toronto, has been sold to Captain John Spence, of Saugeen, for $3,000. She will go into small timber trade on Lake Huron.

British Timber Trade.

Considering the spring trade indications, the London *Timber Trades Journal* says :

With regard to the timber trade, which has been a principal sufferer, it is not that we have had an unusually long winter—on the contrary, we had very fine weather in December—but when winter really did come in January, it came so much in earnest that for nearly a whole fortnight it almost entirely shut up the timber trade and brought it to a standstill, from which it only rallied at intervals till last week, when it seemed to resume its normal course and return to its ancient habits. This interruption to the trade was not limited to any locality ; it pervaded the whole kingdom, but it was chiefly exceptional in the south, where we are unused to such heavy snowfalls and to such biting frosts as we had to contend with during all the latter part of January, and the timber trade suffered in proportion, insomuch that our reports from the provinces were all of one kind for awhile. The state of trade was everywhere torpid, and was easily summed up as no trade at all anywhere.

OUR QUEBEC LETTER.

A QUIET SEASON—STOCKS WINTERING IN QUEBEC—THE MONTMORENCI MILLS—THE PROPOSED SHIPMENT OF LUMBER BY RAIL—THE NEW TIMBER DUES OF QUEBEC—CONFERENCE BETWEEN THE LUMBERMEN AND THE GOVERNMENT.

QUEBEC, March 25th, 1881.

In lumbermen's offices in this city, the present is the quietest season of the year. The accounts of last year's operations and shipments, and of stocks on hand are for the most part completed before the end of January. Contracts for next season's delivery have mostly been made weeks ago, and the chartering of vessels has hardly commenced. The stocks wintering here, as appears from the annual trade circulars of Messrs. J. Bell, Forsyth & Co., are unusually light, particularly those remaining in first hands.

The Montmorenci mills are working on full time night and day, the full yield for the season having been long ago disposed of. The figure paid for the season's cut of pine deals by Messrs. Bryant, Powis & Bryant, of London, has not yet transpired. It is believed in usually well informed circles to fully sustain recent quotations. The firm in question are opening an office in this city, and will certainly load twenty to thirty vessels here during the coming summer.

The shipment of lumber from Ottawa to Quebec, by rail instead of by water, has for some weeks past been engaging public attention here. The question has been opened by the recent connection made between the Canada Central, and Quebec, Montreal, Ottawa and Occidental Railways, and by the facilities offered in this port, where the terminus of the Q.M.O. & O. R. has been extended to deep water. The only difficulty in the scheme appears to be in connection with the rates of freight charged upon these two lines of railway. Lumber has been actually brought for over 200 miles over the Canada Central and its connections to Hull, but it has not been found possible after paying the freight thereon, to go to the expense of shipping it by Q.M.O. & O. R. to this city. The Local Government of Quebec and the management of the Provincial line have attempted patriotically enough to overcome the difficulty, by offering exceptionally low rates for the development of this trade, amounting to something like $17 to $20 per car from Hull to Quebec, a distance of 280 miles. Those interested in this proposed route are not without reasonable hopes that an arrangement will be made between the Provincial or Q.M.O. & O. Railway and the Canada Central, which will allow of the shipment of lumber by rail direct to deep water at Quebec, and avoid the danger and delay of rafting.

The most important event in connection with the lumber industry which has occurred here for a long time past, is the conference had here yesterday between the members of the Local Government and a deputation of lumbermen, concerning the new table of Crown timber dues imposed by the Order-in-Council of November last. It will afford a better understanding to readers outside of Quebec, to explain that prior to the passing of this Order, the dues imposed were ten cents upon logs of 16 inches diameter and under, and fifteen cents upon those of 17 inches and upwards. These dues have been increased to twelve instead of ten cents, and twenty-six cents in the latter case instead of fifteen. Now, the lumbermen complain with reason, not only that the rates, since the new imposition, are exorbitantly high and more than they can afford to pay, especially after so many seasons of depression in the trade, but also that the system of levying the dues is manifestly unfair, and operates to the disadvantage of those getting out a small class of logs. The lumbermen ask therefore, not only that there should be a reduction in the dues, which, by the new Order-in-Council, have been increased from 50 to 75 per cent, but also that the method of levying them should be assimilated to that which obtains in Ontario, where, instead of levying upon the dimensions of the log, a standard of the board measure contained in it is adopted, based upon the tables in Scribner's Doyle. These demands of the trade, decided upon some weeks ago at a convention of lumbermen held in Ottawa, were embodied in a petition to the Provincial Government of Quebec, and an interview was arranged which took place in Montreal. The Commissioner of Crown Lands, Hon. E. J. Flynn, was prevented by illness from participating in this meeting, and consequently a second convention was arranged, through the exertions of Hon. L. Ruggles Church, and took place in this city yesterday. All the Ministers of the Local Government were present, and the following lumbermen: Messrs. James McLaren, E. H. Bronson, J. A. Cameron, J. R. Booth, and W. G. Perley, of Ottawa; and Messrs. Robert Hamilton, Andrew Thompson, and McNaughton, of Quebec. The grievances of the trade, as already exposed, were fully explained, and the demands of the lumbermen were urged upon the Government. It was shown that the dues imposed in Quebec amounted to something like $1.22 per 1,000 feet if imposed as in Ontario by Doyle's Scribner upon the board measure contents of logs, while the dues in Ontario are but 75 cents per 1,000. By way of a compromise, it was stated that the majority of those in the trade, recognizing the necessity of the Provincial finances, would be willing to pay equivalent to $1.00 per 1,000. After a lengthy and pleasant conference, the Hon. Commissioner of Crown Lands informed the deputation that he hoped to be able before long to promise the lumbermen some slight concessions and probably a diminution in the tariff. It was also possible, he said, that next year there might be a change in the system of collection. This, however, could not be attempted during the present season, owing to other instructions having been sent to agents and bush-rangers. The members of the deputation left for home the same evening.

STADACONA.

Board of Trade Returns.

Showing receipts of wood imports into the United Kingdom for the last three years:—

TIMBER, HEWN.

	1878.	*1879.*	*1880.*
Russia	322,219	174,898	336,649
Sweden and Norway	468,096	436,653	658,881
Germany	216,158	200,911	277,579
British North America	260,890	196,431	360,622
Other Countries	413,442	369,322	486,143
	1,680,805	1,378,215	2,119,874

TIMBER, SAWN OR SPLIT, PLANED OR DRESSED.

Russia	914,807	723,609	1,060,608
Sweden and Norway	1,453,477	1,406,730	1,608,201
British North America	963,171	904,559	1,147,040
Other Countries	287,641	218,414	271,055
	3,619,096	3,253,312	4,086,904

As it may be of interest to timber operators to know the points in the United Kingdom which received the bulk of the imports of hewn timber, we annex the following statement:—

IMPORTS.

	1880.
Cardiff	216,226
Greenock	90,363
Hartlepool	168,866
Hull	80,329
Liverpool	128,336
London	241,424
Newport	125,711
Sunderland	122,855
Tyne	112,978

All the above in loads of 50 cubic feet.

Value of Sawdust.

We should hardly credit so large a story from a less reliable source than the *N. W. Lumberman*, but we presume the editor has the statistics, at hand to confirm his assertions:—

"In New York there are about 500 venders of sawdust, having a capital of $200,000 invested, and doing a business amounting to more than $2,000,000 annually. Forty years ago the mills were glad to have sawdust carted away; twenty-five years ago it could be bought for fifty cents a load, but the price has increased, and now it brings $3.50 a load at the mills. It is used at the hotels, eating houses, groceries, and other business places. It is wet and spread over floors in order to make the sweeping cleaner work. Plumbers use a great deal about pipes and buildings to deaden walls and floors. Soda water men and packers of glass and small articles of every kind use it, and dolls and some living creatures are more or less stuffed with it. Yellow pine makes the best sawdust, as it is the least dusty, and has a pungent, healthy smell. But any white wood dust will do. Black walnut sawdust will not sell and is burned."

THERE are 215 penitentiary convicts employed in logging camps in Texas.

THE VANISHING FORESTS.

The New York *Shipping List* says: The American people boast of their quickness to profit by the logic of events but in respect to many things in the line of general duty to society, they are as slow to learn as was the ancient Egypt, who resisted a number of very convincing arguments with which the Lord had intrusted Moses. There can be no doubt, in light of events, that the greed of man, and not the unkindness of nature, must be held responsible for the increasing frequency of droughts in this country. By such an extensive denudation of forest lands is now being practiced, we are seriously disarranging Nature's economy and interfering with the conditions that are essential to her healty processes. It is a generally understood fact, upon which scientific men have now no monopoly, that the increase of draught is, in the long run, in direct ratio to the destruction of the forests and general tree supply. A statistician, who claims to have made accurate calculation, declares that the pine forests of Michigan will be exhausted in thirteen years, and those of Wisconsin and Minnesota in thirty and forty years. There is little reason to doubt the approximate accuracy of the estimate. Twenty years ago this region had scarcely been touched by the axe. The disappearance of forests will make the economy of wood a matter of duty, could a generation habitually thoughtless of its descendants be influenced by such a remote evil. We are a little too much inclined to guard the claims of our descendants as did the miserly humorist, who, when asked to do something which conduced to the good of after ages, asked why he should be called upon to do anything for posterity since posterity had never done anything for him. Wood must always enter more or less into building enterprises. If for no other purpose, our forests should be spared from wanton destruction. If we can economize them by using the more substantial building materials with which nature has so lavishly supplied us, and at the same time save moisture for the parched country, and add safety, beauty and durability to our cities and villages, it is certainly worth our while to make the effort.

Blowing off Boilers.

A French scientific journal gives some useful hints in regard to emptying and blowing off steam boilers. It is injurious to empty a boiler soon after stopping it, because, in the case of an externally fired boiler, the masonry in which it is placed being at a higher temperature than the boiler it envelops, imparts to it some of its heat, which, in the absence of the water, may do it some harm. It is well to admit a current of air through the flues some hours after stopping the generator, and not to empty it before the flues become cooled to a temperature below 300°. When the flues are not too hot, no serious inconvenience is experienced in emptying the boiler under pressure. We do not say at high pressure, as for a boiler, the pressure of which would be 10 pounds, the temperature of the water being 304°, a great quantity of steam would be generated during the process of emptying; we think at a pressure of two pounds the boiler could be emptied without danger or inconvenience. We have sometimes seen owners empty their boilers almost immediately after the fires had been extinguished, clean them with cold water as soon as they were empty, and keep up a current of water so that the workmen might work there. Boilers of small dimensions sometimes resist such treatment, but in large boilers it will be seen that unequal contractions must take place, causing the rivets to burst.

Accurate Statistics, &c.

THE CANADA LUMBERMAN.—This is the title of a paper published in Peterborough, by Toker & Co., devoted to the interests of the Lumber and Timber Industries of the Dominion. THE CANADA LUMBERMAN will be purely a trade organ, and will be absolutely non-political. It will contain those accurate statistics which are necessary to the trade as a basis for intelligent operations. All information of value to the trade at large will be diligently collected and matters of interest to them will be discussed and advocated. Subscription $2 per annum, published semi-monthly.—*Brantford Courier.*

APPREHENSIONS OF NORTH-WESTERN LUMBERMEN.

The *Mississippi Valley Lumberman and Manufacturer* has the following concerning the logging situation on the Upper Mississippi streams:—

"The gravity of the situation comes not so much from the fact that there is too much snow for logging purposes as from the danger of a sudden thaw, which would certainly create the most disastrous floods ever known on the continent. This danger is so imminent that all stand in fear at the probable events of the next sixty days, which will almost certainly ruin scores if not hundreds of lumbermen. There is now more than double as much water on the 150,000 square miles drained by the waters of the Upper Mississippi as there has been since its first settlement at any one time. Last year the floods did more than a million and a half of dollars' damage to the lumbermen of this valley, but from the situation now the losses of 1881 will render the damage of last year insignificant. Those who have logs secure in lakes and small streams will do well to keep them there as long as possible."

FOREST FIRES.

We find the following editorial in the Montreal *Witness*:—

The loss caused by forest fires may be partially seen by a statement made by Mr. Mackay, the great Ottawa lumber merchant, that in four townships between the Mississippi and Madawaska rivers, which fifteen years ago were one of the finest pine countries ever known, the pine has almost all been destroyed by forest fires, started by malicious vagabonds. A series of interesting articles on forestry, by a special correspondent, appeared in the *Witness* a couple of years ago, in which it was made very plain that if remedial legislation were not had and a stern example made of the "malicious vagabonds" and others who, though not malicious, have no sense of responsibility when making fires in the bush, our magnificent forests would in a few years be a thing of the past. Every patriotic man should consider himself personally a custodian of these immense sources of wealth to the country, and do what is in his power by example, rebuke, advice, and, where necessary, "legal persuasion," to make people, especially wandering vagabonds, understand their value.

Port Hope Freight Rates.

A meeting of the vessel-owners of Port Hope was held at the office of Mr. R. C. Smith, jr., to take into consideration the rates of freights from this port. Mr. R. C. Smith, jr., was in the chair. After a general discussion and careful calculation of the expenses of vessels, at the lowest rates, the following rates of freight were adopted, and the owners pledged themselves to carry them out in good faith. The resolutions are based with equal fairness to owners and shippers:—From Port Hope to Oswego, and other American ports on Lake Ontario, lumber, $1.20 per 1,000 ft.; shingles, 20c. per 1,000; lath, pickets, &c., at a proportionate rate; grain 2½c. a bushel (Oswego to Kingston); coal, 40c. per ton (free in and out Oswego to Port Hope); hay, $2 per ton (on and off rail, with deck load); on all other articles of freight, the rates to be regulated by the expenses incurred for the trip and the foregoing freights.—*Times.*

Toronto Freight Rates.

The ice still remains firm in the bay, although the recent fine weather has so honeycombed it in places that crossing it is now considered dangerous. Special telegrams from various ports tend to show a similar state of affairs existing over the lakes, and point to a late opening. At this point preparations are being actively made for the opening of navigation, and both vessels and docks are being thoroughly overhauled and repaired. Rates promise to open higher than last spring, and charters have already been made at $1.25 per thousand on lumber to Oswego.

THE difficulty experienced, in filling orders in the Chicago market, on account of broken stocks is on the increase in the American markets, and it is said that on this account in some markets the lumber being handled is not far removed from green.

Trade Notes.

Canadian.

RAILWAY ties and cedar posts are being shipped in great quantities from Kemptville to the United States.

MEDONTE.—Twenty-nine years ago Mr. Geo. Wright planted a spruce about six inches in circumference. Last season, it measured five feet nine inches in circumference.

THE Halifax *New Era* says: Of inward freight we note 41 cars deals and timber for the loading ships at the depot, and 213 cars coal. Three large ships of from 600 to 1,000 tons each, are at present loading deals and timber at our railway depot.

THE Collingwood *Messenger* says: From Byng Inlet we learn that lumbering operations are over for the season, all the logs required being in. It has been a very favorable winter for lumbering purposes, and there are more logs cut for Byng Inlet mills than in anv past year.

THE value of buildings already projected in Toronto, exclusive of the Parliament buildings and Court House reaches to nearly half a million dollars. On the whole the outlook for building operations in Toronto during the present season, and therefore for the local demand for lumber, is brighter than in any preceding year.

TWENTY-FIVE cars of lumber are being shipped at Ottawa city daily, by the St. Lawrence & Ottawa Railway, to the United States. Last week Bronson & Weston shipped ten car loads of timber by the Canada Central Railway to New York. Col. Robbins also shipped ten car loads of iron ore to the same place.

A RAFT of wood belonging to Mr. Alexander Russell, of Levis, went adrift the other day opposite Beaumont, with three men on board, who were several hours afloat and suffered very severely from the cold. Mr. Russell sent the steamer *Prince Edward* to their assistance, but it failed to find them owing to the darkness of the night; meantime they managed to land at Beaumont.

A COMPARATIVELY new industry is the getting out of hop-poles for the American market. For this purpose small cedar is greatly in demand, owing to its lasting character. Large quantities have been shipped from the stations of the St. Lawrence and Ottawa Railway, and other local lines. Within four weeks from fifty to sixty car loads have been shipped from Buckingham station alone.

A GENTLEMAN just arrived from the Upper Ottawa states that at Fort Eddy, which is 117 miles from Pembroke and 236 from Ottawa, there is plenty of snow for good sleighing. The cut of logs in that region has been in excess of any previous year. It is thought that owing to the large quantity of snow there will be no difficulty in floating out the timber and logs. Shantymen and teams are on their way down the river in large numbers.

ORILLIA.—Last week, Mr. Wm. Ramsay, of the Orillia Carriage Works, shipped to Emerson and Winnipeg, by the Midland railway *via* Whitby, one hundred and ten vehicles—waggons, buggies, and buckboards, all manufactured since the 1st day of February. Mr. Ramsay expects to follow up this shipment with another equally as large in the course of a few weeks. He has about forty men employed, and has enough orders ahead to keep them hard at work for some time.

WASHAGO.—A correspondent writes: Sawlogging has been a boom in this part of the country, the weather and roads being all that could be desired. Thompson, Smith & Sons, of Bradford, and Andrew Tait, of Orillia, have a large quantity of logs on this end of Lake Couchiching. Mr. A. Marshall and others are getting out considerable, and the three shingle mills are running steadily. Messrs. Tobey & Co., of Collingwood, are doing a large business in tanbark; the station yard is nearly filled with it.

FOLLOWING the example of Ontario, an effort is being made in Quebec to interest British capital in the lumbering interests of that Province. Mr. H. Atkinson, of Messrs. H. Atkinson & Co., is at present in Britain forming a joint stock company to work limits in which his firm and La Banque Nationale are interested. He has met with good encouragement and it is reported that upon the strength of his favorable reports, supplies are being sent into the bush so as to be ready for an early start next fall. Messrs. Girouard & Beaudet, who have extensive limits in the Saguenay district, and a fine steam mill at Betsiamis, will also likely put their business into the shape of a joint stock company, and Mr. Girouard is at present in England negotiating to this end.

American.

ONE hundred and fifteen ship builders from Scotland arrived, recently, to work in the ship yards of Detroit, Mich.

IN Boston, the stock of hardwoods has been somewhat enlarged by late arrivals, but prices are firm and unchanged.

PARCHMENT made from the palmetto of Florida is likely to come into quite general use for conveyances, land office receipts, etc.

ONE of the institutions of Beaumont, Texas, is a cistern-factory. The cisterns are made of cypress, and shipped in pieces, to various parts of the state.

IN New York, extreme rates are obtained for everything desirable. Seasoned oak and ash are scarce, and, owing to the limited supply of walnut, the extra demand for mahogany continues.

A CLEVELAND, Ohio, paper says that the present season promises to tax the vessel capacity on the lakes to the utmost and that a marked advance in the freight rates may be looked for.

HENRY & BALDWIN, of Wells River, Vt., have sold their Granby mill land of 13,000 acres, to T. G. Beattie, of Brunswick, and A. M. Beattie, of Lancaster, for $4 per acre. The late owners bought the land, in 1871, for something less than $1 per acre.

THERE are no changes to note in Detroit prices; in fact, the question of price is not put first. Now, the first inquiry is, Can you furnish the bill? Next, Can you deliver at once? If the dealer can furnish and deliver at once he can make a price to suit himself, particularly on dry stock and large or long dimension stuff.

THE Saginaw lumber market has developed no noteworthy changes. Appearances begin to indicate the approach of spring, and some buyers from eastern points have arrived to look over the market. I have heard of no sales, and, so far as learned, no desirable lumber is offering; in fact, that class of stock is not on the market. Prices are steady and firm, with prospects of a very active season.

HON. ALEX. STEWART furnishes the Wausau *Wisconsin* with figures on the season's log crop on the Wisconsin and its tributaries as follows: Upper Wisconsin, 52,750,000; Somo river, 9,600,000; Tomahawk river, 5,500,000; Willow river, 5,900,000; Spirit river, 6,600,000; Devil creek, 1,100,000; Copper river, 3,100,000; New Wood creek, 8,500,000; Prairie river, 10,000,000; Trapp river, 5,700,000; Pine river, 16,700,000. Total, 124,475,000 feet.

AT Milwaukee trade has been very near at a stand still, owing to the big snow storm, as no lumber can be shipped at present on account of our railroad companies refusing to let dealers have cars before they have got their road cleaned from snow so they can again move freight. If this snow storm had not set in they would now be enjoying a good trade. Stocks are getting badly broken on joist, scantling and timber; we also hear of a number of dealers being short on 16-foot fencing.

AN establishment has recently been started near Mobile, Ala., for the manufacture of furniture from gum. The enterprise will be watched with much interest, and should it prove successful, others are sure to spring up in various parts of the country, as it will be a solution to one of the vexed problems of the day. Since walnut has become so scarce and high, furniture manufacturers have been anxiously hunting for something to supersede it, and if it be found in gum it will be a wood at once cheap and abundant.

THE large tract of pine timber land on the upper waters of the Pere Marquette river in Lake and Newaygo counties, Michigan, known as the Waters tract, changed hands recently. It was owned by H. D. Waters, and contains 4,000 acres, from which it is estimated that from 50,000,000 to 100,000,000 feet of pine will be cut. The purchasers are Messrs. Thompson & Patterson, of New York, and Messrs. Walkup, Fisher & Co., of Chicago, who intend making arrangements with some party to build a mill near Crooked Lake, for the purpose of turning the timber into lumber and putting it on the market.

THE cedar tie trade at Cheboygan this season promises to be the most profitable one for several seasons past. One of the most extensive dealers says he is constantly in receipt of letters making inquiries as to whether they can be had in that section. These inquiries come from all sections of the country and show that railroad matters are booming. Several hundred thousand ties are being got out in that vicinity and the indications are that sale could be had for as many more. The most of those being got out are already contracted for.

THE contracts made by Chicago dealers for maple aggregate millions of feet. The demand for maple flooring has not been met for some time past, but there is no probability that it will be scarce for some time to come, although the dry kiln will be for a while called into use. That the sales of this kind of flooring for the present year will exceed those of any two years past, there is no doubt. At the same price many prefer it to ash, and the high price of the latter will cause it to be looked upon with still less favor.

A GENTLEMAN, who has recently been travelling through the lumber regions of Georgia and Florida, writes to the *Lumberman* that he never saw so many vessels on demurrage at the principal shipping points before. They are prevented from loading through the inability of the mills to supply them with cargoes, the long continued rains having made it impossible for the manufacturers to get the logs to saw. In many cases, the mules work in water up to their haunches hauling logs, and after they are hauled, many of the streams are so full it is dangerous to raft them.

THE stave market is pretty well cleaned out. The dealers in Michigan are receiving orders from Iowa, Wisconsin and Minnesota, that they are not able to fill. They attribute the scarcity, partly, to the snow blockade that has kept them back; but, from what we learn, it is safe to say that the stave cut in Indiana has been light this winter. A firm in Minneapolis that heretofore would not use an elm stave has just ordered 100,000 from a dealer here, and other firms are necessarily looking in the same direction. Hoops are in moderate supply and without change in prices, except flat, No. 1, which are selling higher.

THE Diamond Match Company is the name of a corporation recently formed in New Haven, Conn., which, if all reports concerning it be true, starts out with the intention of becoming one of the greatest monopolies in the country. According to the statements made regarding it, it has a capital of $2,250,000, something over one-half of which represents property already purchased, consisting of 23 match factories in different places. It is said to be the purpose of the company to buy up all the factories it can get and convert the business of making matches into a monopoly. To this end it proposes to limit the production and regulate prices.

A BEAUMONT, Texas, paper says that the demand for lumber at the present time is unprecedented in the history of Texas. The only thing which now prevents the mill men from realizing immense profits is the lack of cars to carry their lumber. This defect is being remedied in a measure; but there is another matter of intense interest to them and to that place. The long continued rain has made the hauling of timber impossible, and the consequence is that the supply of logs on hand is short in comparison, both to the cutting capacity of the mills and the demand for lumber, and the lumbermen hope that they will soon be able to ship their stuff promptly.

FROM Cadillac, Mich., it is reported that the bill stuff trade there is beyond all precedent. Prices for same are at least $1 higher, and orders hard to place. Dry stock is very much diminished and nearly all desirable grades are out of first hands. Stocks are badly broken. Buyers are plenty. Some manufacturers are shipping stock barely half dry and putting a price upon it to cover added freight. Prices are, of course, very firm. Opinions differ as to the future. Some dealers are rushing off their stock at quoted prices, as fast as they can get c[illegible] anticipation of a drop as soon as the dry stock along shore can be reached by water. No one expects a further advance, unless temporarily. There are 33 per cent. more logs in hereabouts than at the same date last [illegible]

THE cut of hardwoods this season, it is said, will be the largest in the history of the business. Everybody that can get at a log will cut it. To this rule we know of but one exception. Some of the Michigan men are l[illegible] their maple in reserve, entertaining the opinion that, on general principles in the lumber business, rarely comes to the surface, that a few years hence there may possibly be a call for maple flooring. How wise a move it is, a few years will tell. An extensive pine operator in Michigan recently said to the writer, that although his business was a good one so far as profits are concerned, if he were to sell his mill property and put the money into standing hardwoods, he would expect at the end of a few years to be the winner.

THE *Northwestern Lumberman*, under date of March 16th, says: Anyone in pursuit of information regarding the state of the lumber business throughout the country, and desirous of finding it in a flourishing condition, will not be seriously disappointed in reading the reports from the various distributing points. They uniformly speak of trade as good; in some cases it is characterized as remarkable, considering the season of the year and the fact that the atmospheric conditions are, and have been, so unfavorable for the sale of lumber. The present demand regarding it as a whole, is excellent. Orders are plenty, and inquiries, which afford an even better index of the feeling among the retailers, are received in such numbers that owners of lumber yards are beginning to talk enthusiasticaly of the business that is likely to be transacted this spring. The indications certainly point to a very large spring trade, and most operators are satisfied that the first of it is already reaching the points of distribution. The general report is that almost any quantity of new buildings have been projected, and their erection will be begun as soon as the season is far enough advanced. The expectation on every hand is that the business of this season will largely exceed that of last year, or any year, in fact. The *Lumberman* does not recall a time in the entire history of the trade when the confidence in the future was so great, or when the dealers, at this time in the spring, manifested such a degree of satisfaction with the business doing. There seems to be no question, anywhere, but that we are entering upon a season that will go down in the annals of the lumber trade as one of the most active and prosperous for lumbermen ever known.

NOTICE.

The undersigned having transferred the CANADA LUMBERMAN to Messrs. Toker & Co., Peterborough, it will in future be published by them. The facilities possessed by this extensive and old established house, and the high reputation of the publishers, should be a guarantee that the LUMBERMAN will command a prominent position amongst the leading journals of the day. Those who should patronize it are a wealthy and influential class. The field is ample, and as the undersigned made the transfer above referred to with a view of improving the LUMBERMAN, he feels assured that it only requires the combined support of those in whose interest it is published to ensure it that success which was anticipated when he first established it.

All sums due for subscriptions must be paid to TOKER & Co., or their duly authorized agent.

ALEXANDER BEGG.

February 24, 1881.

The Canada Lumberman

DEVOTED TO THE LUMBER AND TIMBER INTERESTS OF THE DOMINION.

PUBLISHED SEMI-MONTHLY BY

TOKER & Co. PETERBOROUGH.

Terms of Subscription:

One copy, one year, in advance	$2 00
One copy, six months, in advance	1 00

Advertising Rates:

Per line, for one year	$0 90
Per line, for six months	50
Per line, for three months	30
Per line, for first insertion	10
Per line, for each subsequent insertion to 3 mo's.	05
Cards not occupying more than 12 lines (1 inch) per annum	8 00
Cards not occupying more than 12 lines (1 inch) for six months	5 00
Cards not occupying more than 6 lines per annum	5 00
Cards not occupying more than 6 lines, for 6 mo's	3 00

Special rates will be made for page, half page and column advertisements.

Advertisements intended for insertion in any particular issue should reach the office of publication at least three clear days before the day of publication, to insure insertion.

All communications, orders and remittances should be addressed and made payable to TOKER & Co., Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

Travelling Agent.

MR. A. L. W. BEGG has been appointed agent for the CANADA LUMBERMAN, and is authorized to collect subscriptions and grant receipts therefor and to make contracts for advertisements appearing in its columns.

PETERBOROUGH, Ont. APRIL 1, 1881

OUR WOODS AND FORESTS.

In our introductory editorial of the first number of this paper issued from this office, we briefly sketched out the policy in regard to the conservation and management of our forests, which we proposed to advocate. We asserted that the responsibilities attached to this subject should be dealt with by a separate department of the Local Government, which might very properly be called the Bureau of Woods and Forests.

In comparatively new countries such as ours, there is a disposition on the part of the general public to over estimate the areas of timber lands and the quantity of the industrial woods upon them. This arises no doubt from the fact that so long as the required Government revenue is derived from this source, the diminution of forest areas by manufacture, by fires and by other destructive causes excites little attention. If there is any useful lesson to be learned from experience why should we not look for the causes which have denuded European and other countries of their timber—investigate their manner of dealing with the question—and adopt the best methods which modern intelligence has brought to bear on the subject? It should be kept in mind that the prosperity of this country is, in a great measure, dependant upon the existence and the activity of the lumber trade—a trade that in this Dominion of ours gives employment directly, it is estimated, to 100,000 men and 20,000 horses, not to speak of the indirect employment it gives to manufacturers of woollen goods, boots and shoes, and other clothing, to axe factories, foundries and saw manufactories, to railroads and their employees, to vessels with their crews, and to a host of others too numerous to particularize. It is none too soon to call public attention prominently to this, and to have investigations made to ascertain how long the forest resources of the country will stand the present drain upon them It is none too soon to enquire what industry can be established to take the place of this leading factor in Canada's present prosperity, when it is exhausted.

So far we have only alluded to the immediate effect of losing this industry from the want of the raw material, and the most sanguine do not pretend that the period of exhaustion will be extended beyond twenty years. But we propose to look somewhat further and to ask if the study and promotion of arboriculture under Government auspices is not necessary to protect and foster even the agricultural interests of the country. The climatic influences of well distributed forests are only now being understood and appreciated. The effect they have in influencing the humidity of the air and soil—in mitigating the extremes of heat and cold—in preserving the equitable flow of streams—in retarding too sudden evaporation—in the hygienic influence upon the population—are not these matters which should command the attention of our legislators? We shall endeavor to call public attention to the subject by showing what progress other countries have made and the means they have adopted to repress and replace the ravages of the ruthless axe-man and the deadly incendiary.

THE PRODUCTS OF THE FOREST.

One of the eight schedules prepared for use in the taking of the census of the current year is devoted entirely to obtaining a return of the products of the forest for the twelve months ending the 4th instant, divided under the following seventeen headings, viz.:—

1. Number of cubic feet of square white pine.
2. Number of cubic feet of square red pine.
3. Number of cubic feet of square oak.
4. Number of cubic feet of square or sided tamarac.
5. Number of cubic feet of square birch and maple.
6. Number of cubic feet of square elm.
7. Number of cubic feet of black walnut.
8. Number of cubic feet of other species of walnut.
9. Number of cubic feet of hickory.
10. Number of cubic feet of all other kinds of square or sided timber, including railway ties.
11. Number of *census standard of pine logs.
12. Number of census standard of spruce and other logs.
13. Number of spars and masts, including telegraph poles.
14. Number of thousands of staves.
15. Number of cords of lath-wood.
16. Number of cords of tanbark.
17. Number of cords of wood.

*The census standard is 100 feet.

If the enumerators discharge their duty properly and the "getters' out" of our forest products exercise a reasonable amount of forethought and care, in giving the information for which they are to be asked, much valuable information, will thus be obtained with regard to this most important product of our Dominion. We trust that those who can alone furnish the information asked, will deem it their interest as well as their duty to take sufficient trouble to give the facts as they really are and not as they may estimate them in a haphazard sort of fashion—a little forethought is all that is required to do so.

The circulation of the CANADA LUMBERMAN is over 2,000 copies. Advertisers should note this.

CAPITAL OR REVENUE.

The *Monetary Times* of March 4th, in an editorial on Provincial railways subsidies has the following paragraph:—

"A sensible thing to do would have been to separate receipts, which properly belong to capital, from those which properly belong to revenue; otherwise, when the last acre of Crown lands is sold and the proceeds spent, an important source of revenue will have been dried up. The Crown lands might reasonably have been treated as a source of capital, and the net proceeds derived from them, less perhaps what comes from timber, formed a fund intended to be productive when these lands all become private property. A reserve of this kind, intended to meet a deficiency now dimly foreshadowed in revenue, would have been an intelligable provision for the future. An accidental surplus accumulated to-day and liable to be dissipated to-morrow, is more purposeless and less certain of permanence."

While we fully agree in the propriety of treating the land receipts as capital, we maintain that the still more important receipts from our forests should also be looked upon as capital—not revenue. Our forests are being rapidly destroyed and this valuable public property being thus made away with, it is common sense to admit that our capital is by so much dininished. If such a system were adopted as obtains in older countries, by which the forests are perpetually maintained unimpaired, the yearly produce might then fairly be looked upon and treated as revenue.

BRITISH COLUMBIA—ITS TIMBER, &c.

That section of British Columbia west of the Cascades and including Vancouver and Queen Charlotte Islands, is, according to Professor Macoun, covered with, probably, one of the finest forests in the world. Chief amongst the trees is the Douglas Fir *(Abies Douglasii)*, which is the chief forest tree, and which is used throughout the country for building purposes, and for export in the form of deals and spars.

White Cedar *(Thuja gigantea)* is another giant, and in the Valley of the Fraser and up the coast attains to an immense size. The Indians use this wood altogether in the construction of their houses, and in building those large canoes which are the wonder of the eastern people.

The other trees are a species of Yew, another of Alder, two species of Fir *(Abies Menziesii* and *Grandis)*; two species of Pine *(Pinus contorta* and *monticola)*; two species of Maple *(Acer macrophyllum* and *circinatum)*; Hemlock Spruce *(Abies Mertensiana)* is a common tree on the mainland; while a species of Oak *(Quercus Gayrrana)* is abundant on the Island, but has not been detected on the continent. An evergreen tree *(Arbutus Menziesii)* is quite common along the coast of the Island, and, both summer and winter, its foliage contrasts finely with that of the sombre-hued Douglas Fir.

In the second, or arid district, a Pine *(Pinus ponderosa)* takes the place of the Douglas Fir of the coast, and is a very valuable tree, growing to a large size, with clean trunk, and resembling the red pine of Ontario very much. The tops of the lower mountains and the sides of the higher ones support a heavy growth of Douglas Fir, but it is far from being the beautiful tree of the coast.

The timber of the third region is not so good, and consists principally of Poplar and Black Pine *(Pinus contorta)* with occasional groves of Douglas Fir on the higher hills. Black and White Spruce with a little Balsam Fir make up the remainder.

The Island of Vancouver is about 300 miles in length with an average breadth of about 60, and probably contains 20,000 square miles. The soil is good, but the surface is so much broken by rock that it is altogether impossible to tell the amount of good arable land on the Island. There is no doubt the day will come when Vancouver will support a large population—partly agricultural, and partly engaged in mining, lumbering and fishing.

Burrard Inlet is situated on the Gulf of Georgia, a few miles from New Westminster. It is nine miles long—deep and safe. It is the port from which the lumber trade is chiefly carried on. It is very easy of access to vessels of any size or class, and convenient depth of water for anchorage may be found in almost every part of it.

Various species of raspberries, currants, gooseberries, and blueberries are found throughout the country. The Oregon grape *(Berberis aquifolium* and *nervosa)* extends all the way from Vancouver to latitude 55° in the interior, and to Alaska along the coast. Apples and pears of a very large size are produced in such abundance that the former can hardly be sold at any price.

LONGFORD.

On Monday, the 14th instant, Mr. William Thompson, eldest son of Mr. John Thompson, President and Manager of the Longford Lumber Company, was presented with a valuable gold chain and locket, from the employees of the Longford Mills, it being the anniversary of his twenty-first birthday. Mr. John Thompson was also at the same time presented with a tray and elegant silver tea-service and liquor stand, accompanied by the following address from employees in his mills and shanties. The address was read by Mr. Stewart, engineer:—

To John Thompson, Esq.,

We, the employees of the Longford Lumber Company, desire to congratulate you and Mrs. Thompson on your safe return from your native land, hoping you have enjoyed yourselves, viewing the scene of your younger days. No doubt many of them were very dear to you, and you have met some of your relations and friends, who have drawn around you pleasant memories of the past. We take this opportunity of tendering to you our respectful recognition of your many excellent qualities, which yo have shown in your dealings with us; your consideration of our faults, your ready sympathy in our troubles, and the special interest you take in our welfare, through a period extending from one to twelve years. We have felt like yourself many times, despondent at the financial depression prevailing through our country, in almost every occupation, but in your line of business particularly. But we are pleased that now a new era has dawned upon us and matters look more favorable, and we trust that during the coming years, you may have prosperity in every branch of your business, and we can assure you that anything we can do to make it more successful will be our delight. We wish to convey to you the esteem in which you and your family are held by us, and request you and Mrs. Thompson to accept this present as a token of our regard for you, hoping that an All Wise Providence will spare you both to enjoy many happy years together with your family.

Signed in behalf of the employees,

A. STEWART,
And 85 others

Mr. Maxwell Hall, accountant to the firm, on presenting the chain and locket to Mr. Wm. Thompson, read the following address:—

To Mr. Wm. Thompson:

DEAR SIR,—We, the employees of the Longford Lumber Company, felt as this is the aniversary of your twenty-first birthday, and having the very highest regard for you as the eldest son of our esteemed employer, would not allow this occasion to pass unnoticed. We therefore are delighted to congratulate you on arriving at you majority, the age at which one is supposed to leave the days of his boyhood, and reach forward and claim to be a man. The majority of young men on attaining manhood have very often to start out in the world with but small means, this, happily, is not your case, having at your command a large business in connection with your father, and having many of those sterling qualities, which compose the true man, and which we have all so much admired and respected in you. We can assure you that we hope you may long be spared to live a happy and useful life, and in your efforts to make your business a success you will have our warmest sympathies and assistance.

Signed in behalf of the employees,

MAXWELL HALL,
And 30 others.

The addresses were beautifully illuminated, and embellished with scenes associated with the life and butiness of a lumberman.

After the presentations, supper was partaken of in the spacious dining-room of the boarding-hourse in connection with the mills. The occasion was enjoyed by all present, and demonstrated the deep feelings of friendship and confidence existing between the employer and employed. Probably in but few business concerns in Canada, so large as this, does there exist the same degree of mutual good-will and cordiality as are to be found at Longford. After supper the dining-room was cleared and dancing kept up with great glee until a reasonably early hour in the morning.

THE average price paid for hemlock bark at Richmond, Que., is $6.25 per cord.

BOOMS AND BOOMAGE.

The Municipal Council of the County of Northumberland, New Brunswick, have passed a By-law, ordaining :—

1. That the Boom Master of Barnaby River Boom shall, on or before the 31st day of December in each and every year, render to a Committee of three persons appointed by the shareholders of said Boom, a detailed statement of all lumber that shall pass through the said Boom during the season, together with the amount of boomage collected thereon.

2. That the Boom Master shall be entitled to receive out of the amount collected, the sum of $1.00 per day for each day's actual attendance at said Boom, and the balance of the boomage collected shall be distributed by said Committee among the shareholders in proportion to the quantity of lumber each may have.

SLIDES AND BOOMS.

From the report of the Minister of Public Works for the year ending 30th January, 1880, under the heading "Slides and Booms" we have some instructive figures. The Government slides were constructed to effect the passage of timber, where impediments to navigation exist. Works have been constructed on the Saguenay, St. Maurice, Ottawa, and Trent Rivers and some of their tributaries. On the former stream they consist of one slide 5,840 feet in length, with a boom of 1,344 feet and dams, piers and bulkhead. The slide takes the timber past the rapids between Lake St. John and the River Saguenay. The works extend over a distance of 60 miles, and occupied four years in building, having been begun in 1856 and completed in 1860. The slides and booms on the River St, Maurice and the Vermilion, one of its tributaries, are met in the order following :—

Stations.	*Distance from Three Rivers.*
River St. Maurice :—	
Booms at mouth of river	0 miles.
Gres Falls	16 "
Shawenegan	23 "
Grand' Mere	29 "
Little Piles	31½ "
La Tuque	100 "
Plamondon Eddy	106 "
River Vermilion :—	
Mouth of River	116 "
Iroquois Falls	121 "

The principal tributaries of the River St. Maurice are the Shawenegan, Mackinak, Matawan, Petit Bostonais, Grand Bostonais, Croche, Vermilion, Tranche, Grand Pierriche and Manouan. The following works were executed during the fiscal year :—A new pier was built at the mouth of the river St. Maurice with the view of rendering the fastening of the boom more secure, and the working of the swinging boom easier. Old piers at this station were repaired and raised. At Gres Falls, a new wharf was built on the site of the one carried away by last year's freshet. The old booms were repaired and 800 feet of new ones constructed. The slide at Shawenegan was completely restored, the booms repaired and other improvements made at this station. A dam measuring 110 feet long and 7 feet high was constructed at Little Piles, but the water carried it away. $768.81 were expended during the year at La Tuque, towards widening by blasting the channel of the river at the head of the falls. The Government Works for the descent of timber in the Ottawa district, include 11 stations on the Ottawa Main River, 1 on the Gatineau, 15 on the Madawaska, 2 on the Coulonge, 1 on the Black, 24 on the Petewawa, and 12 on the Du Moine. On most of these, more or less work was, of an improving nature, done during the year. The booms, piers and slides and all such portions of the works as are connected with the lumbering operations on the River Trent at Chisholm's Rapids, Ranney's Falls, Middle Falls, Heeley's Falls and Crook's Rapids, were transferred to a company formed purposely for the management and maintenance of those works, with the right of levying tolls thereon, at the rate of five shillings per crib, at each of the slides, except at Chisholm's and Crook's Rapids, where the works constructed do not facilitate the descent of timber. This rate was altered by an Order in Council, on the 8th Dec., 1866, fixing the tolls to be levied at Ranney's Falls and Heeley's Falls, at one cent for each log of 13 feet in length, and a proportionate sum on pieces of greater length ; and one dollar on each crib of square timber. The company are not liable for the renewal of the works, in case of their failure from decay of materials, or their destruction by fire, flood or any other cause. It is their duty to keep an exact account of all monies collected by them, and to transmit the same to the Department of Public Works, as provided by the Orders in Council passed on the subject. The extraordinary repairs which from time to time were required have been executed at the expense of the Government, as also new works at localities other than those mentioned. Since the 20th of May, 1879, when the division of the Public Works Department into two Departments took place, the charge of the works connected with the Trent River navigation has not yet been apportioned between the two departments to which they respectively belong, but has been under the control of the Department of Railways and Canals.

THE TIMBER TRAFFIC AND THE Q. M. O. & O. RAILWAY.

We have no hesitation in affirming that a feeling of intense disappointment has been caused here by the failure of the owners of timber for this market, to make arrangements for shipping it to Quebec by Q.M.O. & O. Railway. It is well, however, to understand the causes that have so far prevented the inauguration of this most desirable traffic. Merchants having timber for Quebec, have of course a certain limit to which they can go in respect of the price to be paid for shipments. The first part of the route by rail to be traversed by this timber is that over the Canada Central Railway from Pembroke to Aylmer, a distance of rather less than 100 miles. From Aylmer to Quebec by Q. M. O. & O. Railway is 280 miles. The merchants who hava thus far attempted to bring timber by rail to Quebec, have found that on the 80 to 100 miles of the Canada Central Railway, the charge for the carriage of their freight has amounted to about two cents per ton per mile, or equivalent to $16 to $18 per car load for the run to Aylmer. This sum is found to be about one-half of the merchant's limit for shipping timber to Quebec, and consequently it has so far been necessary to unload the cars in the vicinity of Ottawa and send the wood to Quebec by water, owing to the very natural refusal of the management of the Government railway to convey it over that road 280 miles for the same figure as the Canada Central receives for carrying it about a third of the distance. The management of the Q.M.O. & O. Railway has, however, offered the lowest possible terms to the shippers in question, in order to foster and develope a traffic which is so urgently demanded in this city. With this object in view, a proposition has been made to shippers, looking to the carriage of timber from Aylmer to Quebec, at something like one instead of two cents per ton per mile, or an amount not exceeding $19 or $20 per car load for the whole distance from Aylmer to Quebec. A less amount would, it is said, entail an absolute loss upon the management of the Provincial road, which of course nobody desires. Mr. Chapleau has occupied himself very largely during his recent visit to Ottawa, in seeking to obtain some reduction in the rates of the Canada Central Railway, and, if possible, to secure some understanding between the management of the two roads relative to a similarity of rates. The Premier is not without hopes of accomplishing his project. The matter rests primarily, of course, with the Canada Central Railway, and it is to be hoped the management of this road will see the advisability of agreeing to such rates as will enable the Q.M.O. & O. Railway to assist in the development of this very important and desirable traffic.—*Quebec Chronicle.*

The Publishers of the CANADA LUMBERMAN desire to obtain a reliable and well informed correspondent in every lumbering centre in the Dominion of Canada, and to that end would ask those disposed to act as such, to communicate with them at once, stating the facilities they possess for obtaining *reliable*, early and full information as to the lumber trade in their respective districts, and the renumeration which they will expect for their services as such correspondents.

LOSSES BY FOREST FIRES.

The *American Agriculturalist* says :—

"We some time ago stated that the Superintendent of the Census had placed all that relates to Forestry, including lumbering, and whatever concerns forestry as a source of national wealth, in the hands of Prof. C. S. Sargent, of the Arnold Aboretum of Harvard University. How thorough his investigation would be, those who know him need not be told. In a general way we may say that his own journeys to the Rocky Mountains and to the Pacific, as far as the forests of Washington territory, his employing of local agents, and the sending of experts to important localities, have been but a part of his labors. To show how every ramification of the subject is provided for, we may refer to the circulars sent out to collect information as to forest fires. We often see articles in the journals lamenting the destruction of our forests by the demand for railroad ties and fuel ; the wanton waste in clearing for farms, and the rapid destruction by lumbermen. It is believed, by those best able to judge, that the destruction of our forests by fires, is greater than from all other causes togother. It is also known that such fires are annually increasing in number. It is believed that these fires are mainly due from avoidable causes, and that proper legislation is needed to prevent this useless waste of national wealth. For proper measures of prevention to be taken, it is an important point to know just the extent of the evil, and this it is proposed to learn by means of the Tenth Census. Prof. Sargent has prepared a circular to be addressed to the town officers in all parts of the country where forest fires may occur. This blank form, which can be readily filled, asks for the number of acres, or square miles of forests destroyed by fire in 1880 ; the value of the property thus destroyed ; causes generally producing such fires, and any suggestions relating to the general subject of forest fires and how they may be prevented or diminished."

TORONTO AND NIPISSING RAILWAY.

The following statement shows the supply of saw logs on hand adjacent to the Toronto and Nipissing Railway, on the 15th March, which will be supplemented during the spring to make up the estimated cut of 1881, at the places mentioned below :—

Manufacturer.	*Place.*	*Logs in ft.*	*Shipments.*
J. E. Gould	Coboconk	1,000,000	2,000,000
Capt. Corson	Victoria Road.		500,000
A. Washington.	" "	50,000	250,000
J. Graham	" "		50,000
McKenzie Bros.	Kirkfield	6,000	500,000
J. McDonald	"	1,700	150,000
J. Cowie	"		140,000
J. Roddie	Sunderland		20,000
I. J. Gould	Uxbridge		500,000
W. Link	"		75,000
H. Clarke	Goodwood	2,000,000	2,250,000
Bessie Bros.	"		1,500,000
White Bros.	Stouffville		100,000
J. Milne	Agincourt	400,000	30,000
W. A. Milne	"	750,000	100,000
J. Ramsden	Mount Albert.	500	50,000
E. B. Appleton	Vivian	3,000	700,000
R. McCormack	"	4,000	1,500,000
R. & A. Bessie	Ballantrae	5,000	1,200,000
W. S. Ramsay	Sutton	600,000	800,000
			12,415,000 ft.

THE UPPER OTTAWA.

Le Moniteur du Commerce says that the timber trade is full of hope at present. Latterly there had been abundant snowfalls on the Upper Ottawa, which is what the shantymen required. The cut has been large and snow was necessary to get the wood out of the forests. It is believed that the cut of square timber on the Upper Ottawa will reach 10,000,000 feet. During the last week twenty cars of square timber have arrived at Ottawa, and as soon as navigation opens they will be floated down for the Quebec market. Every day trains of lumber for the United States leave Ottawa by the Canada Central, the St. Lawrence & Ottawa, or the Q.M.O. & O. The opening of navigation at Ottawa gives promise of a greater activity in business than has ever been known there before.

A Vast Amount of Information.

THE CANADA LUMBERMAN.—Messrs. Toker & Co., of Peterborough, have purchased the above semi-monthly. The number of March 15th is to hand and contains a vast amount of interesting information in regard to the lumber trade. We have no doubt but that it will prove a success under the new management.—*Whitby Gazette.*

PENETANGUISHENE.

A report which appeared in one of the monetary journals gave the estimated cut of lumber in Penetangishene for 1880, at six millions. The figures represent the cut of only one mill, and not of the mills collectively. Our cut this year, says a correspondent, will not be the full capacity of the mills, as our two new mills will not be prepared for working up to the full capacity until the following year, The figures, however, will be as near as possible as follows : Penetanguishene Lumber Company, five million ; C. Beck & Co., six million ; D. Davidson, three and a half million; F. McGibbon, three million, making an aggregate of seventeen and a half million. To this may be added a little more for the cut of Copeland & Marchildar's mills. The timber shipments over the Northern *via* Penetanguishene will be very large, as the great bulk of the timber from the north will be shipped on the rail at Penetanguishene. A good deal of outside lumber, too, is expected to go over the line from mills on the Georgian Bay, and the wharf accommodation is expected to prove altogether inadequate for the requirements of the place.

Think While you Read.

The *Teacher's Journal*, in an article on methods of study, reminds the student that the first essential to successful study is the power of concentration of thought. This power is largely a matter of habit and cultivation. Read five pages of history in a lackadaisical manner. Close the book and write out all you can remember. Then compare your production with the printed matter, and you will be able to judge of your proficiency. Read five pages more with fixed attention and a resolution to retain the subject, and compare as before. You will find a marked improvement. If your memory is treacherous read but very little, and always write out the subject. When you hear a sermon or address, *hear* it, and afterward reduce it to writing. Read no novels, and do not read aloud to please others unless you care (nothing) for the article yourself. A practiced reader can read aloud for hours and carry on an indepenpent train of thought all the time. This ruins the faculty of study as well as the memory. Dismiss all other subjects but the one in hand. Let the ear be deaf to all sounds, and the eye blind to all sights. Let the sense of touch sleep, and smell and taste be as though they were not. A lesson learned in this state of mind will stay with you, and will not need to be "crammed" again the night before examination. It will be like lines carved deep into the rock, or chiseled on the Rosetta stone. The other method is the dim tracing of obscure letters in the sand, which the next wave obliterates.

Travelling up Stream.

Travelling up stream with no other power the force of the current seems an impossibility, and no douht it is so under ordinary circumstances ; but a device has been invented for accomplishing that result. It consists of a car having the ordinary flange wheels and intended to run on rails placed on the edges of a flume, The power is the water in the flume acting on two paddle-wheels at either end of the car attached to the axles of the carriage, The force of the current turns the paddle wheels in an opposite direction from its flow as a matter of course turning the carriage wheels at the same time and propelling the car up stream. When it is desired to follow the course of the stream the paddle wheels are locked so that they cannot revolve and the carriage is carried down with the current. All that is required for this novel railroad is a stream of water passing through a flume, the rails on the sides, and the car with paddles corresponding in shape to the section of the flume. It is a Californian invention and its practicability is said to be established. A test trial with a working model has demonstrated the capacity of the carriage to carry about 8 lbs. of olad (exclusive of its own weight) for every inch (miner's measure) of water in the flume. A flume of six hundred inches of water would therefore furnish power to transport a load of about five thousand pounds, on any grade from four to twenty inches to the rod, at a speed of from four to eight miles an hour ; a less grade causing a slower run.

Market Reports.

Toronto.

LUMBER.—The *Journal of Commerce* says that a number of shipments of clear and pickings have been made to the States, and receipts here are fair. It was generally expected that prices would he higher at the opening this spring, but, with the exception of a few kinds of hardwood, they are unchanged. We quote:

Clear, 1¼ and upwards	$28 00@30 00
Pickings, 1¼ and upwards	18 00@20 00

Quebec Sales and Stocks.

We learn from an undoubted authority in Quebec, that their merchants now in Liverpool have done a fair amount of business at satisfactory prices in timber, but that deals were difficult of sale and that the business done in them had been on a limited scale. This success in Liverpool had led to some little enquiry in Quebec for square white pine and to the sale of three rafts. One of these was timber of 1877—70 feet average and 17 inches girth; price, 27c. per square foot. Another raft of 1877, 67 feet and 17½ inches girth, with only from 5 to 6 per cent., first-class timber in it, price 24c. The other, a raft of superior Kippewa timber, the price and particulars of which were not stated.

These sales reduced the unsold timber in Quebec to three lots, in all 750,000 feet of square timber, besides about 60,000 feet of waney timber.

Chicago.

CHICAGO, March 16, 1881.—With a partial return of more moderate weather, the lumber trade of this city shows signs of the improvement which has been anticipated by the dealers and so often predicted in these columns. The dealers report a demand fully equal to their expectations and fully up to their ability to supply in such stock as will bear shipping. A careful estimate of the stock of one-inch common boards and fencing, now in the yards of this city, discloses the fact that of the former there is now on hand, both of dry and green, of all kinds of boards below D stock, of No. 1, but 24,224,770 feet, and of No. 2, 10,231,000 feet. This is not for all lengths a stock equal to a proper proportion of 16 feet lengths in a well adjusted condition of this market. In fencing strips the inventory is no more satisfactory, showing but 4,671,996 feet of 12 feet lengths, 5,562,930 feet of 14 feet, and 20,997,000 feet of 16 feet in the No. 1 grade, and a total for all lengths of 11,172,000 feet of No. 2. Of the quality enumerated, fully 2,000,000 feet had been already sold, reducing the total yet in the market to about 29,000,000 feet. That this quantity, either of boards or of fencing, will supply the demands of the market until such time as navigation shall fully replenish the supply, is out of the question.

A price list meeting of the dealers was held to-day, at which a few changes only were thought advisable, or at present imperative. These were adopted with unanimity, the only objection urged against them being from those who thought higher rates were warranted. Under the head of box boards, the item C was advanced from $26 to $28. Fencing flooring was raised from $15.50 to $16, and 10-foot fencing from $14.50 to $15. Narrow boards, dressed and matched, and ship lap, and 10-inch common, were advanced 50 cents each. Common and cu l boards were raised 50 cents on each item of the list. In fencing, the No. 1 grade was advanced 50 cents and No. 2 grades $1. Dressed pickets were reduced $1, on account of the course taken by a leading planing-mill firm with regard to them, and a committee was appointed to confer with that house, with a view to harmony. In dimension grades, joist and scantling, 12 to 18 feet, were advanced to $12; timber, 4x4 to 8x8, up to 18 feet in length, to $13; 2x4, 18 feet, to $13; 10 and 20 feet to $14, and 20-foot joist and scantling to $17. Extra A shingles were fixed at $3, and standard A at $2.90. Oak timber is firmer; butternut is $5 higher; maple flooring has advanced from $2 to $3, and walnut, ⅝ and ½-inch, 10 inches and up, select, is quoted $3 higher.—*Northwestern Lumberman.*

The English Wood Market.

James Smith & Co's Liverpool wood circular of March 1st, says:—

The arrivals since our last have been 22 vessels, 13,482 tons, against 12 vessels, 9,779 tons in a corresponding period last year, and 15 vessels, 12,995 tons in 1879.

FROM 26TH JANUARY TO 28TH FEBRUARY, 1881.

	Vessels.	Tons.
Quebec	1	921
St. John, N.B., &c.	4	3,734
United States	13	7,563
Baltic	4	1,264
Total	22	13,481

FROM 26TH JANUARY TO 28TH FEBRUARY, 1880.

	Vessels. Nil.	Tons. Nil.
Quebec		
St. John, N.B., &c.	6	7,055
United States	1	1,154
Baltic	5	1,580
Total	12	9,779

FROM 25TH JANUARY TO 27TH FEBRUARY, 1879.

	Vessels. Nil.	Tons. Nil.
Quebec		
St. John, N.B., &c.	7	6,483
United States	6	5,512
Baltic	2	1,000
Total	15	12,995

The demand in the wood trade continues sluggish, so that little change takes place in the stocks, and if this continues there will be more than ample supplies until the new import comes in. Sales on contract are very difficult to make, and lower prices are being accepted by shippers; this applies more especially to spruce deals and pitch pine. Quebec woods may be said to fully maintain the rates demanded by shippers. Freights continue low and without change, although there are not so many vessels offering at the moment. Money is easy, and the Bank of England reduced the rate of discount on the 17th February to 3 per cent.

COLONIAL WOODS.—The import of yellow pine consists of 56,000 feet, against 25,000 feet last year. The consumption has slightly fallen off, and the stock is consequently still heavy. Sales have been entirely of a retail character, as the fresh arrival consists of a derelict cargo just received, which is on timber merchants' account. Red pine has improved in consumption during the month, but the stock is considerably heavier than that of last year. There are no sales reported. Elm—The fresh arrival consists of 2,080 feet, and the consumption has been 3,000 feet, against 2,000 feet last February; the stock is rather heavy, but with the improved consumption it may not be considered excessive. Oak—The consumption has fallen off very considerably; the stock consists of 476,000 feet; the sales have been by retail only. Black walnut is in fair demand, and sales have been made during the month at from 5s. to 5s. 9d. per cubic foot, averaging about 5s. 4d. per foot. Birch has been in better demand, and the stock has been considerably reduced, consisting now of 207,000 feet, against 153,000 feet; a fresh arrival of 724 logs, ex-Keewaydin, from St. John, was offered at auction, and realized from 14½d.@23½d., averaging 16¼d. per foot. N.B. & N.S. spruce deals:—There is no falling off in consumption for the month as compared with the same time last year, but the stock is still 8,000 standards more, and prices have still further given way; the sales during the month have been by private only, say £6 16s. 6d. for Sheet Harbor, £7 1s. 3d. for Halifax, and £7 2s. 6d. for St. John, and for the new season shipment, contracts have been made at from 5s.@10s. per standard below last spring prices, say £6 17s. 6d.@£7 for Miramichi, £6 15s. for Shediac, and £6 5s. for other inferior shipments, all cost, freight and insurance. The stock of pine deals is light, but the demand is poor, and there will be quite sufficient for the requirements until fresh arrivals come in. Quebec pine deals have been in light demand, consumption having reached but 437 standards, against 1,650 standards at same time last year, and the stock remains very heavy, viz.: 10,088 standards against 4,033 standards; sales have been by private only. Quebec pipe and West India staves are now in fair request, but no sales are reported. Palings and lath-wood are quiet, and no sales have been reported.

Irish Markets.

The *Irish Times* says that there is a better tone in the timber market this week, though but little actual improvement in business can be recorded. The transactions in timber are confined to the supply of urgent wants for immediate consumption, save in a few exceptional cases where merchants in the country, knowing that with any increased demand prices will be higher, have taken advantage of the present low rates to buy some stock for future requirements. The disposition of holders, however, is not to look far ahead at current prices:—

St. John and Miramichi deals	£14 10s@15
1st Quebec deals	£18@22
2nd do	£14 10s@15 10
3rd do	£13 10s@14
4th do	£13

THE RUSSELL HOUSE,

OTTAWA.

JAS. A. GOUIN, - - PROPRIETOR,

Is the Favourite Resort of Leading Public men of the Dominion attending the annual Session of Parliament.

Ministers of the Crown, Senators, Members of Parliament, Public Officials, as well as those having business with the various Departments of the Government. It is also the headquarters of those having dealings with the princely Lumber Manufacturers in the Great Pine Valley, of which Ottawa is the acknowledged centre.

THE RUSSEL HOUSE being central, almost abutting on the magnificant PARLIAMENT and DEPARTMENTAL BUILDING—the pride of the Country—is thus conveniently situated for those visiting the City on public business. But the location is also everything that could be desired alike for the man of business and the man of pleasure. A few minutes walk brings the guest of the Hotel within reach, not only of all the principal business resorts, but also of the most splendid Mountain and Valley Scenery that can be seen anywhere, as also of the two almost unrivalled Waterfalls—the Chaudiere and Rideau—and of the extensive Manufacturing Establishments and Depots of the leading Lumberman. But, besides the beautiful scenery, which, it may be mentioned, includes the magnificant Ottawa and two of its grand tributaries—the Rideau and Gatineau—there are in the immediate neighborhood, beautiful Lakes and apparently never-ending woods, which afford opportunities for the finest Fishing and Shooting that can be obtained on the Continent.

THE RUSSELL HOUSE affords excellent accommodation for 300 guests; its table is abundantly supplied with Viands of the choicest description, in season, and nothing is left undone to make every visitor feel comfortably "at home."

THE GENUINE SILVER-STEEL.

Lance Tooth

CROSS-CUT SAW!

It stands without a rival, and is the fastest cutting saw in the world. It has beaten the best Canadian and American made saws 33¼ per cent in every contest. Its superiority consists of its excellent temper. It is tempered under the secret Chemical Process, which toughens and refines the steel. It gives a finer and keener cutting edge, and will hold it twice as long as any other process. We have the sole right for this process for the Dominion of Canada.

None genuine that are not like the above cut, with registered trade mark with the word "The Lance," and Maple Leaf with our name. Price $1 per foot.

CAUTION.—Beware of Counterfeits. There are inferior counterfeits on the market, which are intended to be sold at a high price upon the reputation of this saw. We will send to any address a saw exactly like any counterfeit, warranted equal in quality or no sale, at 60c. per foot. Therefore do not be humbugged into paying a first-class price for a second-class saw. A fact to bear in mind is that if the material and temper are not of the very best quality the shape of the teeth amounts nothing. A saw, like a knive, will not cut fast without it will hold a keen, cutting edge. We have cut off a 14-inch sound basswood log in eight seconds with this saw. Manufactured only by

(PATENT)

BARREL MACHINE

One man and two boys can turn out

One Hundred and Fifty First-class Flour Barrels in Ten Hours,

made from veneered wood of two thicknesses. The inside is one solid sheet of veneer running around the barrel, making in reality one hoop from top to bottom, and in the outside thickness the grain is reversed, running up and down, finished with five hoops two inches wide, reversed again, making the barrel almost three thicknesses, which gives the package superior strength, tightness and durability over the ordinary hand-made flour barrels, yet with all its many advantages cost less than the old style of package. My barrel machine is arranged to make all sized packages from a large barrel down to small nail kegs, butter packages and cheese boxes. I am open to prove at any time the superior strength of my barrel. That one will stand more hardship by any actual test than one hundred of the old ordinary flour barrels. MACHINERY OILS!

TO DEALERS & CONSUMERS.

STOCK OLEVNIE, Equals Castor Oil, and Warranted not to Gum.

STOCK OLEVINE, Equals Castor Oil, and Warranted not to Gum.

It will give the subscriber much pleasure to forward, post free, to any address, on application, a pamphlet, containing instruction and information that have been found of the greatest practical use to dealers and consumers of machinery oil in Canada. It contains the fullest information as to the different kinds of oils, their qualities and uses, thus enabling the consumer to make choice of the very oil best adapted to his wants, and also enables the merchant to select the kinds most likely to be in demand in his neighborhood. The pamphlet shows conclusively that oils properly manufactured from petroleum, are vastly superior to any *animal* or *vegetable* oil. I am now making the same qualities of "Extra" and "XX" oils I manufactured from 1870 to 1873. They are *guaranteed not to thicken with extreme cold*, and warranted to give satisfaction in every particular. Beware of Agents soliciting your orders without my trade-marked order-book.

M. Covel's Latest Improved Automatic Saw Sharpener!

Is the Most Perfect Machine that has ever been Introduced into Mills for that purpose.

CIRCULAR SAW STEAM FEED!

I would also call special attention to my

Heavy Circular Saw Mills

and for STEAM MILLS, would recommend the Steam Feed, having put in several which are giving the best of satisfaction, as will be seen by the following testimonials:—

GRAVENHURST, August 20th, 1880.

WM. HAMILTON, ESQ., Peterborough.

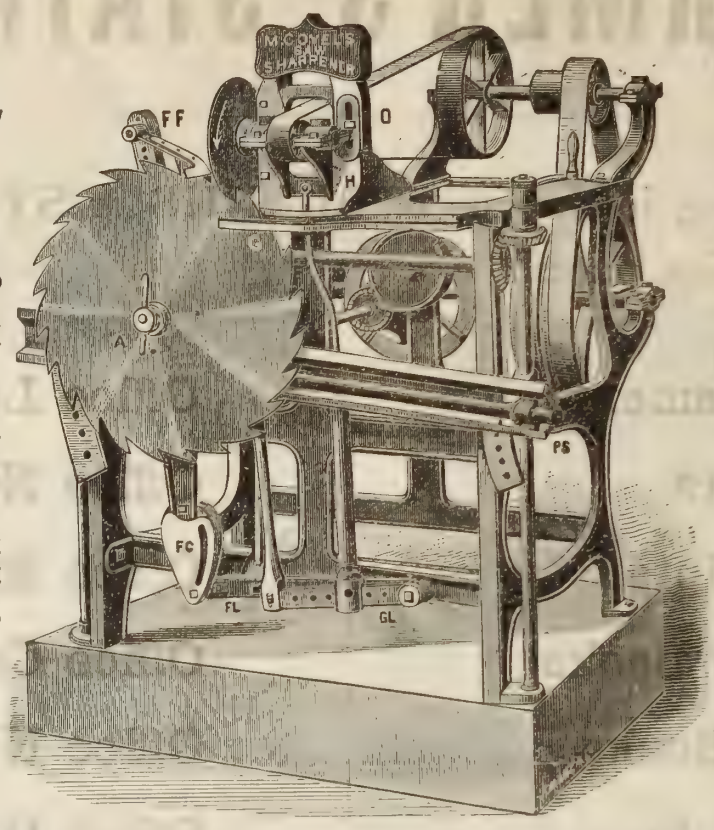
DEAR SIR—I have used your Steam Feed for near four months, and it has given me perfect satisfaction in every way; it is admitted by every person who has seen it work to be the best feed ever invented. Since I put it into my mill, I have not lost ten minutes time fixing anything belonging to it. I can cut 18 boards 13 ft. long in one minute. It can do much smoother and better work than the pinion feed. It is easily governed and reverses the carriages instantly. I am thoroughly satisfied with it and can recommend it to any person who has a Circular Saw Mill for cutting long or short logs. I consider I have cut more lumber than will pay for the Steam Feed since I got it than I would have cut had I not put it in.

Yours respectfully,
WILLIAM TAIT,
Lumberman, Gravenhurst.

TORONTO, August 11th, 1880.

WM. HAMILTON, Peterborough, Ont.

DEAR SIR—The Steam Feed you put in is working splendidly. Yours, &c.,
THOMPSON, SMITH & SON.



MILL MACHINERY!

I am also manufacturing Saw Mill Machinery, for all sizes of Gang or Circular Mills, Span or Double Circulars for Slabbing Small Logs. My Patent Jack Chain for drawing logs into Saw Mills, acknowledged by all to be the Cheapest and best ever got up; also, my Patent Lumber Markers, different sizes of Edgers, Gang Lath Mills, Trimmers, Power Gummers, and all Machinery used in a first class Gang or Circular Saw Mill; also, small Hand Gummers for use in the woods, for Cross-cut Saws. Rotary Pumps of different sizes, for Fire Protection in Mills, &c.

Horizontal Engines and Boilers

CORLISS  ENGINES

Where economy of fuel is the great consideration, along with uniformity of speed, such as is required in Grist and Flouring Mills, Woollen and Cotton Factories, or large Factories of any kind, I supply the Corliss Engine. I feel justified in saying that our Style, Workmanship and Finish on this Engine will be no discredit to its renown, and certainly is not equalled in this country for economy of fuel. I have them working at 2½ pounds of coal per horse-power per hour. L10

VOL. 1. PETERBOROUGH, ONT., APRIL 15, 1881. NO. 12.

FORESTRY AND ARBORICULTURE.

BEING THE FOURTH CHAPTER OF THE REPORT OF THE ONTARIO AGRICULTURAL COMMISSION.

Economic Uses of Woods.

While pine has, in everybody's mind, a certain recognized market value, other woods are often regarded, or at all events treated, as though they were all but worthless, or, if marketed, handled and disposed of with little practical intelligence. Since the sittings for taking oral evidence closed, the Commissioners —impressed with the importance of the subject —have put themselves in communication with Messrs. John Oliver & Co., of Toronto, a firm referred to by Mr. Hay in his evidence as large dealers in hardwood lumber. Messrs. Oliver & Co. have been good enough to supply the Commissioners with a considerable amount of additional information, and their statement will be referred to in the Report.

The value of timber in an economical sense, must of course depend on the purposes to which its several varieties can be profitably adapted. The principal uses, in general terms, of Canadian forest woods, exclusive of pine, are as follows :—

THE ELM.—"Rock Elm," says Mr. Hay, "we don't use except for building purposes. Soft elm makes a better seat for chairs than basswood." Carriage making, heads of barrels, and hubs of waggons, and agricultural implements, are also mentioned as utilizing elm in considerable quantities. Other classes of elm are in limited demand, but chiefly used for the manufacture of common furniture.

THE ASH.—Of the white ash Mr. Hay says: "White ash is a very valuable wood, and makes excellent bedroom furniture. It may be used for house fittings. A good many offices are now fitted up with hardwood, and also railway carriages. Ash is used largely by carriage builders. There is no wood will stand like ash in that respect ; it is next to mahogany. It is a shame to see our valuable wood cut down and wasted as it is and has been."

The ash is now being used to a very considerable extent in the construction of the interiors of railway passenger cars. Bent stuff for tools, agricultural implements, hay-forks, hoe and broom handles are also manufactured from ash. The use of ash, for the internal fittings of buildings, alluded to by Mr. Hay, as practicable, has according to some other reports been pretty extensively adopted. Mr. Beadle, referring to his own experience, says :—

"When building my own house I found I could obtain chestnut and ash wood as cheap as, or cheaper than first-class pine, and I used them. I think they are much more handsome than painted wood work."

Black Ash is more plentiful, but its uses are limited.

THE MAPLE.—Mr. Hay says of the use of maple in his business (furniture manufacturing): "You can get any quantity of the hard maple, but it is the soft maple that is the most valuable. It is the more valuable for furniture as it stands better and does not warp. Soft maple is not so plentiful as hard."

In the United Counties, soft maple is sometimes used for house-flooring ; it is also in some demand by agricultural implement manufacturers.

Mr. W. C. Caldwell, M.P.P., of Lanark Village, says :—"Hard maple is used for waggon axletrees, as well as several other purposes. I had an order for some from Manitoba, but could not supply it in time." Maple has also, according to one report, been used for paper pulp making.

THE OAK.—Oak is used for a variety of purposes, the manufacture of barrel staves being one of the largest causes of demand for this wood. It is also used to a considerable extent in agricultural implement manufactories, and for ship-building. "Of oak" (say Messrs. Oliver & Co.) "there are considerable varieties —white, red, grey, and blue. The former is the most valuable. It is found in several parts of the Province, principally in the North and West. A large quantity of it is made into square timber for export." Mr. Dempsey mentions in his evidence that the Grand Trunk Company got a good deal of white oak from his section (Prince Edward County), for the purpose of making railway cars. Ties are also made of oak, where the wood is sufficiently plentiful. Mr. Hay objects to oak because it is hard to work, and "warps like the mischief," nevertheless it is not unfrequently used for furniture.

The firm of Bennett Bros., of London, manufacturers of church and school furniture, writes as follows with regard to the use of oak :—

"It was stated that oak is unfit for furniture. If white oak was meant this was correct ; but white oak is valuable for many other purposes, namely staves, bent ware, and carriage work ; but it is, and has been, so valuable, that it is nearly as scarce as walnut in this country, and will soon have to be imported in the same manner as walnut.

"There are, however, other varieties of oak, black or red, and yellow, of which there are large quantities in all parts of the country, both of which are well adapted for furniture, being straight in the grain and not liable to warp or change its shape, besides being easily wrought, and when finished, there is no wood to equal it in appearance except walnut, and perhaps some varieties of white ash.

"We might state that we use it entirely in church furniture and school work, and it is to be regretted that so much of what is destined to become a valuable wood is being destroyed through ignorance.

"As you are probably aware, fashions change in wood like in everything else. Twenty-five years ago it was all mahogany and oak, then walnut ; at the present it is imitation of ebony, mahogany coming in, with a prospect of oak to follow, in which case oak will become a valuable wood."

THE CHESTNUT.—Of this wood Messrs. Oliver & Co. say :—

"This wood is now almost extinct, and what remains is confined to the same limits in the Province as is walnut. Its principal use is in the finishing of churches, also public and private offices."

THE POPLAR.—A considerable demand has sprung up for poplar, the wood of which is used for making paper pulp. In the Niagara district, and in Prince Edward County, as well as elsewhere, it has been eagerly secured at from $3 to $4 per cord for that purpose. The demand for poplar for this branch of industry is likely to increase rather than diminish. Poplar is also used to manufacture charcoal for smelting purposes.

THE BIRCH.—In view of the rapid disappearance of the walnut, the black birch will be the alternative with furniture-makers. Mr. Hay says with regart to this wood :—

"Black birch will be the only wood you can fall back on in a few years. In the north there is a great deal of it. It is an excellent wood. At present it is not dear because it is not scarce.

"You can get any quantity of it north, and it can be purchased at the mill readily at from $15 to $16 a thousand. Black birch is to be found in all the northern regions. There is a great deal in the Manitoulin Islands, and in the Peterborough and Haliburton district. It is to be found also in Muskoka. They have been shipping birch from Lower Canada these many years back. It is quite an article of export there. Black birch is mixed with the different woods of the country in large quantities. It is very easily detected among other trees. I don't use so very much of it now, but it is on birch we shall have to fall back after the walnut is gone. It is from birch that these perforated chair-bottoms are made. I think there is such a thing as bird's-eye birch, but it is very scarce. I wouldn't give more for that kind of birch than plain wood."

Messrs. Oliver & Co. say of the birch :—

"This wood is found in nearly every part of the Province. It is a very fine wood, and although the demand for it is yet very small, there is little doubt but that, in a few years, it will be largely in request for the uses to which cherry, butternut and walnut are now put. It should be husbanded with the greatest care."

THE BEECH.—Beech has no standing in the market except for fire-wood.

THE BASSWOOD.—Basswood, like poplar, is in good demand for paper-making purposes. Mr. Caldwell, M.P.P., also refers to it as used for furniture, and for boxes in starch factories. All that can be got is shipped to Oswego. Mr. Hay uses it for furniture. It can be used in some cases in place of pine, and is cheaper than clear pine. Mr. Beall says :—

"Basswood, until lately, has been largely used for buggy making, but it is not so much used since the introduction of bent wood for the bodies of buggies."

THE WHITEWOOD OR TULIP TREE.—The whitewood or tulip, which grows exclusively in the warmer sections of the Province. is used largely by carriage-makers in constructing the bodies of carriages. Messrs. Oliver & Co. say, about the whitewood :—

"A few years ago there was a large quantity of this wood growing in the western part of the Province, but owing to the great demand for it, it is being rapidly consumed, and is now very scarce. It meets a ready sale at good prices. Its principal uses are for car and carriage building, and in the manufacture of furniture."

THE WILD CHERRY.—A large demand for this wood has sprung up, chiefly in the United States. Mr. Hay says of it :—

"In supplying the place of walnut, cherry is a very valuable wood. They are using it very extensively in the United States, making ebonized furniture from it. It has a very close grain, and it is very fast disappearing. I am speaking of wild cherry. That tree grows to a fair size. We get some lumber twenty and twenty-two inches broad from it. I never saw a cherry tree growing. so that I can't say how much lumber there would be in one. I can't say whether they are high or not, but some of them grow to nearly the same girth as walnut.

"The wild cherry forms a resource to fall back upon in the absence of walnut, but it, too, is fast disappearing. We are exporting wild cherry largely to the United States, where black furniture is very fashionable, and cherry lumber takes the best stain. I think it is as enduring as walnut."

Cherry wood is also being used largely in the internal fittings of cars and public buildings.

THE WALNUT.—The Black Walnut, so far as it exists, is the staple article in demand for cabinet work of all kinds. Mr. Hay thus refers to this wood :—

"When I first came to this country there was very little walnut used, but one or two years afterwards it came to be used more extensively. I think it was Sir Peregrine Maitland who first introduced walnut here, and who was the first to make it fashionable. Previous to that, they had used cherry, or any of the common woods. Since its first introduction, walnut has been the staple fashionable wood for making furniture.

"When we first commenced making walnut furniture we got the wood from Canada West.

A great deal came from about Port Stanley and the banks of the Thames, in Kent, Essex,

and South Middlesex. We now obtain very little walnut indeed from that part of the country.

"Lately we have been getting our principal supplies of walnut from Indiana. The walnut grown in that State is as good as that grown in Canada, but as you go south of Indiana the walnut is of a lighter shade. The dark walnut grows best in a climate such as that of Michigan or Canada. I don't suppose the supply in Indiana is inexhaustible. I have been told, in fact, it will not last a great many years.

"When I came to Canada first they used walnut for rail fences. The principal value of walnut is that it is an excellent wood for furniture, and is handsome in appearance. It is universally admired, has a close grain, is not liable to be much affected by changes of temperature, and at the same time it is not hard to work. It is a very valuable timber economically.

"I couldn't say exactly what time it would take for a walnut tree to grow to matarity, fifty or sixty years at least. I don't know any other part of Canada where walnut is to be found except the district I have mentioned. There was a little once in the Niagara district, but that has been cut down. There is none at all north of us. I don't think any careful examination has ever been made of the walnut region to ascertain how much of the wood may still be remaining ; but I am sure there can only be very little left. I have never appointed an agent for that purpose. Walnut is admitted free of duty into Canada ; it would be a desirable thing to replant walnut. There would be a great market for it."

Black walnut is being used in the manufacture of sewing machines, organs, and car building, as well as for the purposes already mentioned.

THE BUTTERNUT.—The Butternut is mentioned as being used in many cases as a substitute for walnut for cabinet work, since the latter has become scarce. Mr. Hay does not, however, utilize it to a large extent in his business. He says :—"Besides cherry, butternut is a useful wood. Some call it white walnut. We do not get a great deal of butternut, as we cannot use it much for furniture. It is not a substitute for the black walnut. Some houses inside are fitted up with it." Butternut is excellent wood for veneering, and also used in finishing the interior of churches and other public buildings, and in the manufacture of cigar boxes.

THE HICKORY.—Hickory is in demand from very early stages of its existence, to the time of mature growth. Mr. Beadle says, in connection with this wood :—

"One of the greatest pests we have in our country is the axe-helve hunter. When a hickory tree gets to be six inches in diameter he will offer the farmer so much for it that he is induced to sell it."

For handles for tools, hickory is in perpetual request. The spokes and finer parts of carriages, are also made of hickory.

SYCAMORE.—Of the Sycamore, Messrs. Oliver & Co. say :—

"This wood is grown entirely in the western part of the Province, and being scarce is in good demand. It is not much used in Canada, and what there is, is principally manufactured into tobacco boxes. Owing to the high prices to be paid for it ; soft elm and basswood are being used as substitutes."

THE CEDAR, HEMLOCK, TAMARACK.—There is a constant demand for these woods, or one or other of them, for rails, posts, railway ties, and many other purposes. Hemlock bark is also largely in request by tanners for tanning hides.

The following quantities of square timber is expected to be transported over the Toronto, Grey and Bruce Railway this season :—

Cook Bros.	160,000	cubic feet.
Burton Bros.	160,000	"
McArthur Bros.	100,000	"
Flatt & Bradley	50,000	"
J. Lattimer	40,000	"
J. Stinson	30,000	"
Total	540,000	cubic feet.

HAGYARD'S PECTORAL BALSAM is composed of the most healing balsams and gums. The balsams, which enter into its composition, were used by the natives when America was first discovered, and are combined with other vegetable tonics, so blended together, that it is a specific for all affections of the throat and lungs. Thousands of bottles are used annually, and is considered one of the standard preparations of the day.

SPRING PRICES FOR LUMBER.

It is one of the peculiar features of this season's business that there has been no weakness of moment displayed in any of the northwestern markets. Generally, as the winter draws to a close and the time approaches for navigation to open, an operator here and there will begin to get nervous, and possibly shade his figures a trifle. This sort of thing being contagious, it spreads rapidly from yard to yard, and from market to market, until the whole lumber-selling district is filled with dealers who are more intent upon making prices that shall be as low as their neighbor's, or lower, than they are upon getting a profit on their lumber or even getting back the money invested in it. It is customary, in fact, for lumbermen to have a terrible time with prices from about the first of April to the middle of July. What with the discounts attributable to moving yards, the weakening effect of the early arrivals from the manufacturing points, and the general competition that comes with the opening up of business, the spring months are usually turned into a season for cut prices, which everybody deplores and helps to make at the same time. This rule seems to have operated without regard to the kind of trade that the lumber dealers looked forward to. It may be remembered that the prospect for business a year ago at this time was remarkably fine ; it may also occur to most of our readers that notwithstanding the activity with which business started up at the opening, and the apparently bright prospect ahead, the middle of May, and indeed an earlier date, found prices in a sad condition of demoralization. They will probably be able, without much effort, to recall two further facts : first, that the decline in prices was followed very quickly by a marked decrease in the volume of trade, acd secondly, that the business continued to average less than in the previous year until, some time in July, prices were again advanced and their former firmness re-established. Last year, in this respect, was simply a copy of the year before, that of the last previous one, and so on for a half dozen or more, before which time, we believe, the custom of breaking up the spring trade and taking all the profit out of it by an indefensible cutting of the current prices, was not so generally recognized as to become binding upon the trade.

The question that arises just now is whether the trade proposes this spring to follow the groove cut for it in the days when business was poor and depression and financial disaster the rule, or is to mark out for itself a new road and travel steadfastly in it through this trying season. That there is some disposition on the part of the present holders of lumber to take the latter course, the *Lumberman* feels justified in assuring its readers, the conclusion being supported both by the statements made by a number of Chicago dealers—who are generally in the foremost rank when any cutting is going on—and by the similar statements that reach it through the medium of correspondence from lumbermen in all parts of the Northwest. In one of the trade meetings in this city not very long ago, one large dealer, who is known to be pretty well supplied with stock, declared his disbelief in the theory that prices must fall in the spring, and his views were generally approved by those present ; while from competing points we have only to refer to the correspondence that appears in the columns of this paper from week to week—evidence that is abundantly supported by private advices from the operators themselves—to show that the general feeling outside is favorable to a continuation of the present firmness and the present remunerative prices.

As an abstract proposition, it would hardly seem that there could be two opinions about this matter. The lumber that is now offering, and that which will be sold during the next three months, was mostly bought in the latter part of last season, at a time when it was pretty nearly at the top of the market. There has been added to this price the cost of piling, insurance, interest, and the regular proportion per thousand feet that all lumber must bear of the current expenses of the yard, such as rent, labor in handling and selling, etc., these items in the aggregate probably bringing the net cost of the lumber, as it now stsnds in pile, up to a point that is only enough below the quoted prices to admit of a fair profit on the investment and risk. This lumber, costing within a small sum of what it brings, is wanted, as near as can be found out, by consumers. Retail dealers are already buying freely, and there is every indication that there will be an ample demand for every foot of stuff that is now drying, probably before it can be as thoroughly seasoned as it ought to be for shipping. Can any one, as a matter of fact, see in such circumstances as these any reason for suffering prices to decline as they did last spring, and as they have done spring after spring heretofore ? If there is any such reason, it must lurk in a very obscure corner, for the *Lumberman*, though it has searched dilligently, has failed to find it. To a disinterested person it seems like a perfectly plain matter, about which argument is the most unnecessary thing imaginable, and any other conclusion than that no real occasion exists for cutting prices this spring seems unwarranted and altogether unreasonable.

There are twenty reasons why prices should be held up, to every one that may be brought forward to bear out the notion that they should go down. One of these reasons is a particularly strong one, and one that should have great weight with all members of the trade. If there are any dealers who may be tempted to shade a little here and there in getting out a new list, the *Lumberman* would ask them to pause a moment and consider what will be the effect of such action. Will it be apt to bring to their yard more orders, and will they realize from it the nimble sixpence that is said to be better than the slower shilling ? The facts will hardly bear out any such theory. If anybody thinks that the true way to stir up trade is to make a cut in prices, he should study the history of his business a little. In April, 1880, the lumber dealers in this market indulged in the costly luxury of cut lists, and what was the result ? Simply that the shipments from this market for the first half of the year showed a falling off of something like five per cent., and this, when at the beginning of April they exhibited a gain of an equal percentage, thus proving that the cut in prices, which was made for the purpose of improving the business in point of volume, actually reduced the amount of it to such a degree that it did not even keep up to that of the previous year, which, as everybody knows, was not thought to be a very active season.

If this is not satisfying proof, the proposition may be reasoned out, and the same conclusion arrived at. Let us inquire for a moment how a cut in prices acts upon a buyer. Does it have the effect to make him anxious to get hold of all the lumber he can, and induce him to send to market large orders by the earliest mail? Generally speaking, no. When he gets news of a cut in prices, he quietly curls himself up in his chair and soliloquizes something after this fashion : "That's just about what I expected. All this talk that the drummers have been getting off about prices being firm and likely to go up, and about there only being logs enough to supply the demand, is all taffy ; there's going to be lots of lumber, and lumber is going down still more. Now, wouldn't I be a fool to buy any lumber now, when I am almost sure to get it from 50 cents to $2 less two or three weeks hence ? No, thank you ; I'll wait a bit." Whereupon he returns meditatively to his private office, and carefully depositing the fragments of a partly written order for lumber in the waste basket, turns with a bland smile to a customer who has just come in, with the remark : "It is impossible for me to fill your bill, Mr. Smith, for two or three weeks. I think you better put off building until after you get through planting. I may be able to shade the price a trifle then." This sort of thing among the retailers of course tends to make the cutter of price lists and the advocate of low prices happy, because it brings him such an enormous trade and such marvelous profits !

We might multiply arguments indefinitely, and adduce facts without number, to show the fallacy of the reasoning employed to prove that prices should be reduced at this season of the year ; but we shall not do it, because it appears unnecessary. The present tendency at the chief distributing points is not in the direction of a decline, and we think there is warrant for the belief that it will not take that direction. The spring will probably be a peculiar one, and its peculiarities will be of a kind that tend to strengthen the market. For one thing, the opening will be late, which will put off much longer than usual the arrival of fresh stock. Assortments, too, must continue to be very much broken, and the difficulty in filling orders consequent upon this circumstance will make the lumbermen more anxious to get full value for what they do fill, and give them less time to worry over the possible chance that the yard on the opposite side of the way may have received one or two more orders than they did in the last mail. The trade that will undoubtedly set in, if it is not disturbed, as soon as good weather gets the upper hand again, will also stimulate prices to some extent, and, when it gets fairly started, help to make them firmer by showing the dealers that the business is really there and coming to the front just as fast as it can. That the business is there, and that the dealers will get it, if they are sensible enough not to frighten it away with low prices, the *Lumberman* has not a doubt, and consequently it is equally certain that the price list will need no further revision in the direction of lower figures this spring.

If the indications by which lumbermen judge of the future are worth anything, they point very plainly to the fact that there will be a demand heavy enough this spring to use up about all the dry lumber the dealers can get their hands on, and to sell this stock they have carried all winter, and that they paid a high price for when they bought it, for less than it is worth, would seem to any ordinary constituted intellect an act of supreme folly. The *Lumberman* cannot believe the representatives of the trade, who have this matter under their control, can be guilty of such a piece of foolishness, and it has therefore high hopes of recording, as the present year goes by, a business in lumber that will make the biggest booms of other years seem small by comparison.—*Northwestern Lumberman.*

LAKE INSURANCE.

The Buffalo *Courier* says :—The insurance companies engaged in marine underwriting on the lakes have finally come to an agreement as to a schedule of rates for hull risks for the ensuing season. The rates published have been formally adopted by all of these companies, without reservation. On an average they are about one and a half cents higher than those of last year, which, as is well known, was exceedingly disastrous to lake underwriters. At present there seems to be a strong unanimity of feeling among the representatives of the companies interested in this important subject, and experience has shown that it is for the interest of them all to work together throughout the season on a mutual basis :—

The Inland Lloyds classification register of 1881 to be the basis as to class and valuation.

COWAL.—Thomas C. Lipsey, of Cowal, Dunwich, Elgin Co., will cut at his mill this season over 600,000 feet of hardwood.

HAMILTON'S FOUNDRY AND MACHINE SHOP, PETERBOROUGH.

SAW MILL WORK A SPECIALTY—A NEW CIRCULAR MILL—COVEL'S SAW SHARPENER—VERY LARGE STEAM HAMMER—A BUSY SEASON.

The large foundry and machine shop of Mr. W. Hamilton is known to every resident of the Town of Peterborough, and to many living at a considerable distance. It has for years been looked on as one of its leading industries, and judging from present appearances it is bound to keep a place in the front rank. The name of Mr. W. Hamilton as a first rate manufacturer in his own particular class of work, is now fully established from one end of the Dominion to the other, and it is not by any means unknown across the border, as many of the American firms, with which he has come in contact in the matter of tendering, can testify, to their cost. He makes a specialty of mill work of all kinds, more particularly that used in sawmills, and furnishes such institutions throughout from top to bottom. As is well known, Mr. Hamilton does not turn out any trashy work, but instead, everything, no matter how small or large it may be, has to pass the minutest inspection by practical men before it leaves the establishment, and thus customers are assured of obtainiug the very best article that can be manufactured by men thoroughly skilled in their business.

A VISIT TO THE FOUNDRY.

The first glimpse of the premises betokened business, boilers complete and half finished, as well as numerous other heavy articles were to be seen on the road infront of the premises, and the number of men engaged in putting in raw material and taking out finely finished machinery ready to place in position, gave the neighborhood a business-like air. Passing inside, through the door of the machine shop, we found ourselves surrounded on all sides by workmen busily engaged at their various occupations, and were almost deafened by the the increased din and clatter of the various machines, which were all in full operation. Mr. Hamilton informed us that busines is booming without any doubt. Every department was engaged to its fullest capacity, and still they found it very difficult to keep up with their orders. Being very busy himself, he introduced us to Mr. W. H. Trout, the draughtsman and the chief designer of the works, who kindly consented to show us through this "hive of industry."

SOMETHING NEW AND UNIQUE.

Mr. Trout was busily engaged in the drawings of a new circular saw for Messrs. Irwin & Boyd for the Nassau mills. It is of a wholly new design, made from entirely new patterns, drawings, etc., and is calculated to meet every present and even the probable future wants of the lumbermen. It is a very heavy, powerful mill driven by a 20 inch belt, running on a 33 inch mandrel pulley. The mandrel is 4½ inches in diameter and nearly eight feet long. The frame or husk is 6x9 feet. All the pulleys are extra heavy with solid web and are perfectly balanced. The racks and pinions for the carriage are cut from solid cast steel. New improvements are claimed for the set works, giving greater exactness and convenience. The quick reversal of a heavy carriage and heavy machinery, or a quick change from feed to gig, or gig to feed is probably the foremost problem in the mechanics of circular mills. An automatic brake which plays it part at the proper moment, offers to accomplish this most effectively. One movement of a convenient lever sets all the dogs. The saw is set in line without changing its relation to the carriage or any other portion of the machinery, as it is all self-contained, the main belt for tightening the pulley not excepted. This performs double duty; besides serving its proper office it drives the gig. The carriage is operated by a 1¼ hemp rope. With suitable gearing it may be worked by a wire rope, or the ordinary rack stick and pinion, or in steam mills by the steam feed. We understand that a patent has been applied for, covering all the improvements, and have no doubt that it will be granted. Practical men who have examined this mill all agree that it is the mill of the future. Before commencing our inspection of the various shops, Mr. Trout furnished us with some information as to their business.

SOME GENERAL FACTS.

Work has never been as plentiful since 1872, in which year there was a great run, but still not as much as at the present time. The work turned out now is far superior in every respect to that which was turned out eight years ago, for the simple reason that the mill men will not look at work now that they would jump at then. The prospects for the continuance of the flow of work are brighter than ever they were and the future outlook is excellent. Mr. Hamilton has refused some heavy contracts, for which he had the first chance, on account of not being able to turn out the work in the specified time. Several offers of work from Manitoba have also been refused as he prefers to handle work nearer home, when there is enough of it to keep all employed, as is the case at the present time. The capacity of the shop is limited and we are told that is is proposed to extend the premises shortly, in fact the necessity for such a step is very apparent, and will be more so before long. The wages of the employees have been recently increased all round and even at the enhanced figures, it is a very difficult thing to secure competent men, a rather different state of things from a few years since, when first-class men could be obtained on all sides at a considerably lower figure than is now paid. As we said before, Mr. Hamilton's specialty is mill-work, particularly that for saw-mills. For this class he has the "run" for Ontario and does the bulk of the work. Nearly all of the large lumber manufacturing firms deal here and many of the smaller ones, although the greater portion of the work required for the latter can be done at nearly every foundry throughout the country.

WORK ON HAND AND RECENTLY DONE.

All the machinery required for the large elevator, now being erected by the Midland Railway, is being made at the present time. The engine is of the latest improved Corliss pattern and is of 120 horse-power. The boiler, a return tubular, is 5½x14 feet. Besides the engine and boiler there is all the shafting, pulleys, etc., of which a large number will be required. There is also in course of construction a circular mill for Mr. Tait, of Gravenhurst, who was recently burned out; a circular mill and all the etceteras for Messrs. Williams and Murray, of Blind River, Georgian Bay; two gang mills for Gilmour, of Trenton; Ross & Co., of Buckingham, Quebec; and similar machines for at least a dozen other firms; two dozen of Covel's patent saw sharpeners, (which are manufactured by this firm under the Canadian patent, and are rapidly winning their way into public favor), besides complete outfits or repairs of some kind for nearly every mill in this district. So busy have they been in filling orders that Mr. Trout has been kept steadily employed since the beginning of the present year in draughting patterns for the work.

THE PATTERN SHOP.

In the pattern shop in the second story of the main building over the machine shop. We found eight men at work, with Mr. W. McLean as foreman. All the patterns are made here, and such wooden work as is required on the various machines. There is not much wood work to do as iron is chiefly used in the construction of all the various patterns of the machinery which is made. Cogging wheels and making frames for sawmill carriages, and putting together frames generally appears to be the principal work. Several of the men were engaged in making windlasses for towing sawlogs and rafts of timber on the lakes. The machinery in operation consisted of two planing machines, and numerous saws.

THE MACHINE SHOP.

We next entered the machine shop, under the charge of Mr. Geo. Munro. Here everything was in activity. Every person was busy and worked as if they knew that there was lots to follow. Immediately in the rear of the machine shop is the blacksmith shop, where six men were working at their forges under the watchful eye of Mr, John Fraser. The machine shop is literally "chocked full" of shaping and slotting machines, planers, emery wheels, and the thousand and one large and small machines which are known to the mechanic. It looks as though it would be an impossibility to crowd any more men or machines into this room, and as things are at present it could not be done, but we are told that by a re-distribution, which it is proposed to make at an early day, if the premises are not extended in the meantime, one-third more men and machines can be accommodated. The hands here are utterably incapable to keep up with the press of work, but in order to accomplish as much as possible they work until ten o'clock every night. There is in this room a steam hammer which is worthy of special mention. There is nothing like it to be seen outside of the cities, and large cities at that. Toronto cannot even boast of one, and of course Mr. Munro feels proud. This feature alone distinguishes this establishment from all others of a similar character in the Province. It can be used for forging both heavy and light work, in fact anything from a monster anchor down. It will work with any amount of force from a few pounds to several tons. The possession of this hammer is a great advantage, as formerly all heavy work had to be sent from Peterborough to Buffalo in order to be forged, but now it can all be done at home and a large amount of time and money saved. Some of the workmen were engaged in putting the finishing touches to the large span circular mill for the Messrs. Gilmour of Trenton. The machine is thirty feet long and is operated by a steam cylinder. The logs are cut the same on both sides, slabs and boards being taken off in any desired number, and the stock left any size wished for, according to the diameter of the log. The log is held on at one end only by a massive iron dog, which is an entirely new feature, and one that cannot help but please. The idea is a new one and originated in this shop. This is only the second mill of this kind that has been turned out; the first one has been in operation in Mr. Buck's mill at Port Severn during the last season, and that gentleman says it is the most satisfactory he has ever had in any of his mills. Coming from a gentleman of such great experience of Mr. Buck, this statement has naturally has a good effect, and Mr. Hamilton expects to have a large run on these machines during the present year.

THE MOULDING SHOP.

Having viewed the machine shop thoroughly, we next proceeded to the moulding shop, where Mr. Thos. Tucker is looked up to. This is by long odds the quietest room in the whole foundry, but noise is not necessary here—although dust appears to be—to carry on operations. The men were engaged in doing only general work necessary for the contracts. In a large oven are dried the cores and special moulds, which are sent in and taken out on a small car which runs on rails. Iron casting is carried on every alternate day, and brass casting at irregular intervals, just whenever required. The heaviest cast made is about four tons, although, should occasion require it, they can cast as high as five tons. To an ordinary observer not acquainted with the work going on, this is the least interesting room in the building, and that fact combined with the dust which was floating around thick, made us take a hasty departure to

THE BOILER SHOP.

Things are quiet enough here except when riveting is going on, and then any person who is fond of noise should just drop around and listen for a short time. Boilers for the Midland elevator and half a dozen other places were in process of construction. As a general thing many of the boiler makers are employed at outside work, and it is a rare thing to find the whole staff in the room. In this branch Mr. Hamilton has had more competition than in any other department of the business. Some large firms do nothing else but manufacture boilers, but notwithstanding this fact, good work always tells, and as the majority of people prefer a first-class article, Mr. Hamilton's boiler shop is kept busy all the time. Here are large hoists, cranes, etc., for moving the heavy work and loading it on waggons, by which all the machinery made has to be drawn to the railway stations. When the "missing link" is constructed, it is expected to pass close to the foundry and will thus remove one great obstacle and greatly facilitate shipment.—*Review.*

The circulation of the CANADA LUMBERMAN is over 2,000 copies. Advertisers should note this

MINDEN.

JOBBERS.—The Bobcaygeon *Independent* s[ays]: We have had a very busy time here all winter, and one of great prosperity to both settlers and store keepers. The lumbering has arrived at a point when there are not so ma[ny] and many more jobbers. It is not the [pro]fitable to the country. In fact it [is] able, for the money goes more directly [into] hands of the settlers. A settler [cuts] logs, and sells them to the lumberman, makes all that can be made by the operat[or], [and more] than would be the case if the lumberman run a shanty and took them out with his o[wn] men. One operator, who manges the [business] for a Bank, paid over nine thousand dollars this season to settlers for logs they got out, and others in proportion. But the feature of the season has been the large quantities of [wood] produce taken out other than pine logs and squared timber. The Victoria Railway will carry not less than a hundred thousand railway ties, twenty thousand telegraph poles, and so many posts, and so much cord wood, that no estimate can yet be accurately made. The ties bring 14 cents each, the poles about 30cts. each. Thus $14,000 will go to the settlers for ties, and $6,000 for poles. This $20,000 goes into the pockets of the settlers, and is just so much gained as a result of the railway being opened. The ties, in another year or two, will attain a value of twenty cents each, and then it will be a good business. I should think that not less than $20,000 will be paid to the settlers for posts and cord wood, and thus forty thousand dollars will be gained to this country, this year, by the construction of the railway,—which cost the country altogether only $55,000 of bonus.

UXBRIDGE CAR WORKS.

The car works of the Toronto & Nipissing Railway are situate in Uxbridge, and form one of the most complete establishments of the kind in Canada, although not by any means the largest. There is now on the stocks almost completed a first-class passenger coach, which will be finished equal to any on the continent. The inside will be of walnut facing, with Hungarian ash panels. The coach is 57 feet in length over all, 8 feet 10 inches wide outside, and will contain 32 double seats. The framework is strengthened by upright iron stanchions, and triangular iron braces, which, from their peculiar construction, support the carriage from each end. The roof has 10 iron rafters, connected with ribs fastened to the floor, giving great strength combined with lightness. Several new cattle cars are also under way. They are 30 feet long, 8 feet 10 inches wide, by 6 feet 2 inches high, clear of roof, giving ample room for stock. The cars, although to be used on the narrow gauge, are of dimensions suitable for the standard width, should the railway company at any time decide to widen the gauge. The rolling stock of the company is kept in excellent order, and under the management of Mr. Joseph Haggas, mechanical superintendent, keeps improving. The locomotive department turns out first-class work—amongst which may be mentioned a speciality, viz.: "the Haggas Water Elevator," an ingenious contrivance for supplying locomotives with water from underground tanks along the line. It is worked by a suction pipe connected with the engine, which, by forming a vacuum, draws the requisite supply of of water into the tender in a very short time. This apparatus is adopted by the Midland and other railways, and is found to work well. It does away with elevated tanks and pumps, and is safer from frost during winter. Mr. C. E. Caron is in charge of the wood department, as master car builder.

IN cases of Chronic Diseases which doctors have failed to cure, BURDOCK BLOOD BITTERS has achieved its greatest triumph. All diseases of the Blood, Liver and Kidneys, Scrofula, Dyspepsia, Nervous Debility, Rheumatism, Piles, Female Complaints, and all forms of lost vitality, are promptly cured by this great renovating Tonic. Trial bottles only cost 10 cents.

"Hail Beauteous, Bounteous, Gladsome Spring"—this was Mark Twain's prize poem—but the dire diseases incident to spring, spoil the romance. Burdock Blood Bitters is the prize remedy, the remedy prized by all who have tried it as the best Blood Purifying Tonic and System Regulator in the market. It cures all Blood Humors from the worst Scrofula to a common Pimple. Sample bottles 10 cents. For sale by all dealers in medicine.

THE TIMBER SUPPLY QUESTION.

We have received the following for publication :—

SIR,—I have for several years been endavoring, through the press and in pamphlets, to draw attention to and impress on the Government and lumberers, both of Ontario and Quebec, the importance and necessity of preserving our timber resources, so as to place us in a position to take advantage of the wants and necessities of our neighbors across the line, when their supplies are exhausted, and notwithstanding I showed that that time was within a few years of its accomplishment, no heed has been given to my warnings.

Since my first introduction of the question of supply, in the United States and Canada, the Western lumber periodicals have lost no opportunity in trying to discredit my statistics on the subject. They have in the interest of the manufacturers been endeavoring to hoodwink the consumers with assertions that their timber resources were abundant to meet the demand for many years, and thus withholding them from pressing on the Government the necessity of admitting our Canadian lumber free of duty and all other obstructions to which it is liable. But the Government itself has now, it appears, taken the matter in hand, and has sent experts to the timber supplying States of Michigan, Wisconsin and Minnesota, the only ones they have from the Rocky Mountains to the Eastern Atlantic seaboard, to investigate and report on the extent of their timber resources for their forthcoming census returns, and I herewith beg to hand you a copy of the New York *Times*, of the 21st instant, containing an article on the subject, in hopes you will give it to the public through the LUMBERMAN.

It will be seen from the article referred to, that at the present rate of consumption their supply will be totally exhausted within the short period of about nine years, and when there is added to the population a yearly complement of a million and a half consumers, a number equal to the whole population of the Province of Quebec, the supply will not suffice to respond to the demand for half-a-dozen years at the outside, and in two or three years at the very farthest a total cessation of shipments to the East must take place, which will necessitate a doubling of our present manufacturing capacity to supply its place, and be the means of doubling as well the value of our wood product.

The Western Ontario papers inform us of 100 acres of pine changing hands recently at $22,000, enough to purchase half-a-dozen good farms with all their buildings and betterments, and $1,000 have been refused for ten pine trees in the Township of Puslinch. And what is the reason of this extraordinary advance in the value of such property? It simply arises from a scarcity where, a few years ago, pine on a farm lot was looked upon as an eyesore. It might surely be supposed that our lumberers would take a lesson from this—but no—the state of prosperity to which the United States have attained, occasioning an increased consumption of lumber coupled with a short supply and a consequent good demand, have had the effect of sending our lumberers into the woods with double force, to slaughter away and keep the markets glutted, and thus waste their timber and entail on themselves a double loss.

I do not hesitate or fear to assert that there is no description of commercial wood in our forests that will not in five years be worth more standing where it is, than it is to-day manufactured for market.

JAMES LITTLE.

Cote St. Antoine, Montreal, March 25th, 1881.

When on the 13th May, 1878, you published a letter, from Mr. James Little, of Montreal, on the subject of the devastation of our woodlands, you no doubt remember the incredulty with which his statements were received by those pretending to be informed on the subject ; but you have now the satisfaction of showing that the warnings then given are fully justified by the reports of the Government itself, now coming to light through the medium of the lumber journals of the West, which, I may remark, were as adverse to giving currency to the facts then as they are now urgent to have it recognized that they assisted in giving the warning.

The facts that he presented were, that of the whole twenty-six States, comprising the New England, Middle, Western, and North-Western to the Rocky Mountains, only four, namely, Maine, Michigan, Wisconsin and Minnesota, had a supply of timber in excess of their own wants, and the question was, how long the supply for commercial purposes would last the drain upon them? The white pine being the wood of prime importance, his remarks were that the supply of this timber was confined almost entirely to the three States of Michigan, Wisconsin and Minnesota, and that the demand on them was so heavy for all sections of the country, that it would not be possible for them to respond to it for more than six or seven years longer.

The *North-western Lumberman* now states, from information derived from the proper authorities, that the forthcoming report of the United States census will show that the pine timber supply of the North-West, in 1880, was in Minnesota, credited by popular estimate with 40,000,000,000, only 6,150,000,000 ; Wisconsin, from statements varied from 80,000,000,000 to 100,000,000,000, only 40,500,000,000, and Michigan, on both the upper and lower peninsulas, 35,000,000,000, making a total supply of 81,500,000,000 feet of pine timber. This paper at the same time states that the aggregate cut and destruction of pine in the three States is not far from 8,000,000,000 feet per annum, so that, if we deduct the past winter's cut, which has been an exceedingly heavy one, there remains standing to-day in the whole North-West only 73,500,000,000 feet, which is distributed about as follows, viz.:—

In Minnesota	5,500,000,000
In Wisconsin	38,000,000,000
In Michigan	30,000,000,000
Total	73,500,000,000

From the above it will be seen that even now, when only three years of the six or seven mentioned by Mr. Little have gone, these States have reached a condition when common prudence would say they had not another foot to spare. They are rapidly growing in wealth and population, and in all probability will have 6,000,000 inhabitants to supply within their own boundaries in the next ten years, so that the amount now remaining would barely supply their own wants for twenty years from to-day ; but what will be their condition in four years from this time if the continued slaughter of the pine is kept up?

In round numbers, Michigan is parting with her forests at the rate of 5,000,000,000 feet a year ; consequently at the end of four years will have only 10,000,000,000 remaining to supply her more than 2,000,000 people. Wisconsin will probably part with 13,000,000,000 during the same period, leaving her with only 25,000,000,000, and Minnesota, that has not a stock to-day one quarter sufficient for her own wants, will be reduced to 3,000,000,000, leaving only 38,000,000,000 of white pine in the whole North-West (an amount little more two years' consumption of the whole country), as the reserve supply, not only for themselves, but for the entire country. It is but trifling with the subject to speak of the few patches here and there in our own State, and in Pennsylvania, Virginia, or elsewhere.

Formerly, when the New England States parted with their pine, there remained the forests of New York, Pennsylvania and Canada to fall back on, these in their turn fell back on Michigan, but now the reserves themselves are about gone, and even Canada is forced to compete for supplies in the forests of Michigan and Wisconsin for the English market, and unless something is at once done to stop the destruction of this indispensable timber, it will be all gone, and we will have only the stumps remaining to remind us of our folly.

It is to be hoped, now that the Government has come into possession of the facts, it will take means to enlighten the public on this most important subject. An enlightened public opinion can do much to aid in stemming the tide of destruction which is now going on with reckless precipitancy. A knowledge of the value of their property will cause owners to be more careful of it and not be disposed to part with it to go abroad at one-tenth the value it will have in a few years, standing it their forests for their own wants. The substitution of spruce, hemlock and other woods for such purposes as they are suitable, by stopping the frightful butchery of this timber which is now going on by the use of circular saws, that turn one-quarter of the tree into sawdust ; by allowing the young trees to grow ; by the Government withholding its timber lands from sale ; by preventing, if possible, the making of square timber in the woods, by which one-third of the tree is cut into score blocks and shavings, furnishing the most fruitful source of fire, and by throwing open our ports to the free entry of timber from any country that may be willing to spare it—and now that this timber is about gone, if the lumber papers have at last learned to recognize the difference between a pine tree and a gooseberry bush, so as to give their patrons correct information on this important subject, some little may yet be done to prolong the supply of this indispensable timber.

WILLIAM LITTLE.

Astor House, New York, March 16th, 1881.

—*New York Times, March 21st.*

VANISHING FORESTS.

The Toronto *Mail* says that the lumber question seems to be coming, if not "within the range of practical politics," at least within the range of practical business men. A long conference on the expediency of protecting the forests was recently held in Chicago ; and it is a noticeable fact that the remarks were made chiefly by the owners of pine lands and the operators of saw-mills, who may fairly be supposed, from the nature of their business, to have a more intimate acquaintance with the present condition of our forests, and the necessity of protecting them and of replacing them as they are cut off, than those who merely sell the lumber after it is sawed. The situation in the States certainly seems to be rather startling. The N. Y. *Shipping List* lately said it had been advised that "the pine forests of Michigan will be exhausted in thirteen years, and those of Wisconsin and Minnesota in thirty and forty years." After quoting and commenting upon Mr. Little's letter, which we publish in another column, the *Mail* continues : "The census commissioners ought certainly to be expected to be well-informed and impartial men ; and if the actual situation should be as is stated it is rather a serious matter for the States. But it is equally serious for Canada. Lumber is our staple export ; if our neighbors' fields should be run out they will turn to us if we have any left. A large part of our territory seems fit for nothing else than a lumber field. This being the fact, and a demand on its resources being certain, should we not seek to turn its resources to the best account?"

Waste Paper.

A recent report of the controller of the British Stationery Office, whose function is to provide the paper used in all the government offices, states that the value of the waste paper collected from the various offices and sold for the public account averages $50,000 a year. Hitherto it has been the rule to turn the bulk of this paper over to a single firm, under bond to reduce it to pulp in the United Kingdom. Under such conditions, the price received was less than the paper was worth in open market. The paper is now sent to the state prisons, where it is sorted and torn up, so as to be rendered practically illegible, and then sold unconditionally at much better prices than before.

At first thought it might seem to be more economical to burn the paper at once, and thus save all the expense of collection and transportation ; but the controller states that the money received for waste paper in some years amounts to more than the total salaries of the controller, assistant controller, and staffs of the department in both England and Ireland.

THE CANADA LUMBERMAN.—A journal in the interest of the lumber trade, bearing the above title, which has been published in Toronto, has passed into the hands of Toker & Co., of the Peterborough REVIEW, who will publish it hereafter. Under their energetic management it will no doubt command a large share of patronage, and if the initial number is any criterion, it well deserves to. Published semi-monthly at $2 a year.—*Picton Times.*

THE FREDERICTON BOOM COMPANY.

Recognizing the impetus given to lumbering operations last fall by the favorable state of the English markets, and feeling confident that the cut on the Upper St. John and its tributaries would be in excess of previous years, the Fredericton Boom Company have made ample preparations to boom, hold and raft every stick that may float or be driven down the river this year. To do this necessitated not only the repairing of many piers in the old booms, but the providing of increased boom space. Work was commenced on January 3rd in the Gill boom, below Fredericton ; and here 15 to 20 teams, along with about fifty men, were employed till three new piers had been constructed and the damage done by the ice to six of the old piers had been repaired. A large jam pier was also erected in the Mitchell boom, likewise below Fredericton. The main operations, however, were conducted at Sugar Island, just below the mouth of the Keswick, where a new reserve boom has been located and constructed, capable of holding sixty millions and intended, in case of a big run, to relieve the Douglas and Lincoln booms to that extent. The location is admirable for the purpose, being well sheltered and having deep water throughout the season. Here the company have expended fully $5,000 in the erection of thirteen jam and block piers, which will render the boom fully able to stand all strain. All logs running down the river can be turned into this area by means of a sheer boom set at the head for this purpose. The boom was located by Stephen Glasier, Esq., agent of the boom company, who has also personally superintended the construction and repairs to the several booms this winter. Perhaps the most difficult task Mr. Glasier had to undertake was devising means to guard the ten million logs now in the Douglas boom from being carried away by the run of ice this spring ; and along with them, between four and five millions lying rafted in the wake of the boomed logs—all these logs having come down last fall too late to be got away before navigation closed. Two new piers have been built in this boom and the seventeen existing piers have each been raised about five feet, so as to prevent the ice from jamming in on top of the logs and carrying them away. It is expected that these piers will present an impassable barrier to the run of up-river ice and turn it in another direction, thus saving the logs in the boom. With respect to the five million rafted just below the boom, as the ice there is rotting rapidly, it is believed that they can be got away before the up-river ice runs down. Messrs. D. D. Glasier & Sons are keeping a sharp lookout, and by pushing their tugs up as fast as possible, taking advantage of the open creeks, expect to be able to tow these rafts down to St. John ahead of the main body of ice. While the boom company have made most extensive arrangements for the summer business, more improvements would have been made in the lower booms if the early wasting away of the ice had not prevented the lumber having been got out for the purpose. From the best information attainable, the company look forward to a run this spring and summer of about 150,000,000, and have made their arrangements accordingly. The quantity of snow now in the woods on the Aroostook and Upper St. John renders the chance of a sudden fall of water like that of last spring impossible, so it is extremely probable that most of the quantity above estimated will reach the boom this spring and early summer.—*St. John Sun.*

FOREST FIRES.

ATTLEBORO, Mass., March 28.—An extensive fire has been raging in the woods between Attleboro and Mansfield all day, extending into Wrenthan, where to-night it is burning with great fury. A large quantity of wood and timber has been destroyed, and several dwellings are threatened. A force of men are fighting the fire, which is fanned by a strong breeze.

WILKESBARRE, March 28.—Forest fires are burning furiously on the mountains near here along the line of the Lehigh and Susquehanna railroad, and are spreading rapidly to-night.

GLOUCESTER, Mass., March 28.—An extensive fire is raging in the woods between here and Rockfort, which threatens to burn a large area.

INFORMATION WANTED.

The *Globe* had the following editorial under the heading "Information Wanted Concerning Our Forest Wealth":—

"We have already remarked upon the absence of any definite information as to the extent of our pine lands and the character of the timber standing thereon. We have suggested that an official investigation be held before persons authorized to call for the statistics and other facts necessary to get an accurate idea of the revenue from timber dues hereafter to be received by the Province; to collect information upon practicable methods of forest conservation; to consider how far the very efficient German system of forestry can be introduced here; and generally to take such steps as will tend to bring about a cessation of many extremely wasteful practices on the part of lumberers and the owners of timbered lands.

"Upon a great many important points in forestry there is now a plentiful lack of information. All we know about our forests is contained in the report of the Agricultural Commission. That report is a perfect mine of information concerning the agricultural state of the townships in this Province, and so far as the Commission was concerned in the subject of forestry, its duties were exceedingly well performed. For instance, we learned from that report for the first time that, in the older part of the Province, there are only ten counties in which more than two-thirds of the land has been cleared, and only two counties in which more than three-quarters of the land has been cleared. What we want now is further information in this direction. Especially is it desirable that means be taken to diffuse among the owners of standing timber information concerning its present and prospective value. Hardwood timber, standing in any place where it can be easily won, is becoming very valuable. As respects black birch, the prospect seems to be that it will soon become the most valuable of our forest trees, so rapidly is furniture made from that wood coming into fashion. A word in time might prevent the felling for firewood of many a valuable birch, maple, or oak. It is also desirable to know how far the use of poplar in paper-making is likely to extend, and the extent of the supply of that wood standing within easy reach of the paper mills. In some parts of of New England poplar already brings $8 a cord for paper-making, and wood for those mills is taken from Canada in great quantities. It may be that only accurate information is wanted in order to compel the Yankee paper-makers to pay us a much better price than they do for their raw material. The supply of basswood, and the extent to which that wood is capable of being utilized, would be another interesting point for investigation. There might also be some practical means found of exacting fulfilment of promises made by the railway companies which asked and received aid from Canadian towns on the promise that cordwood should be brought in cheaply. It is too bad that, within a hundred miles of Toronto, and close to a railway aided liberally by the city, the clearings of new settlers should still be burnt in the old wasteful style, simply because the railway does not care to aid in reducing the supply of wood available for its own fuel. But such is the case.

"Then there is a great field for usefulness in the collection and dissemination of intelligence concerning the re-clothing with timber of thousands of acres of land which ought never to have been cleared for agricultural purposes. There is scarcely a township, and in some townships not a farm, which has not some land which could be more profitably put to growing timber than to any other purpose. Bare hillsides, too poor for orchards, might be put to use growing poplar or some other quick-growing tree, and the planter of the trees might begin to receive his money back in ten years from the first investment. Of young hickories we import hundreds of thousands yearly, from Ohio and elsewhere, that might just as well be grown at home. In some parts of the Province the black walnut might be grown at a profit. In all parts there is something more to be done with timber than is done. A very general desire is arising among the farmers to do something in the way of tree-planting. What they want is detailed and accurate information as to the best direction in which to bestow their work, and this information could best be obtained in the manner we have indicated."

MAKING IRON COLUMNS SECURE.

So many accidents have occurred at fires to life and property by the sudden giving away of iron columns used for supports to the various floors of buildings, that such colums are looked upon with distrust by firemen, and their use discouraged. When they become heated by fire they are apt to break entirely, thus letting the upper floors fall. It was in consequence of the giving away of the iron columns at the Broadway fire, some time ago, that the floors from cellar to roof fell in and two firemen who were on the roof were hurried to a terrible death in the seething furnace within the building. All large cities are full of buildings whose several floors are supported on iron columns, and, in case of fire, they are quite as likely to collapse as did the one we refer to. Our building laws, which are yet crude and imperfect, permit their use, and, as they are cheaper than most anything that could be used instead, they are still favorites with builders. The very best thing to take the place of iron columns would be columns of brick, but objection is made to them that they take up too much room and are not ornamental.

Many experiments have been tried with a view to making iron columns fireproof, or at least sufficiently so to be able to stand a small fire in their neighborhood without bending, and thus bringing the entire building to the ground in ruins, long before it would be destroyed by the fire alone. Casing the columns with wood, asbestos, brickwork, etc., has been tried, and some of the methods have been described in the *Journal*. Recently two more suggestions have been made. One is to inclose the columns in rings of terra cotta, put on over the top when the column is set up. These would act as a shield to keep off the heat till the fire could be subdued. The plan is simple and inexpensive, and has the added advantage of giving opportunity to make the columns highly ornamental, as terra cotta readily lends itself to decorative treatment.

The second plan is to fill the columns with water. To do this the plates or castings, usually placed between the columns where they stand one over the other, have holes or openings of some kind, so that there is a free communication from column to column, from the bottom to the top of the building. Where columns are already erected, short pipes are used to connect them at each floor. The uppermost column is also provided with a small escape-pipe, passing through the roof to the open air. At the base of each tier of columns a pipe is connected with the street mains, so that all the columns may be filled with water, either permanently or on emergency. When thus filled with water and provided with an escape for the expansion of the water or steam, the columns would stand unharmed until every floor was burned out. Were the girders also hollow and filled with water in the same manner, both girders and columns would undoubtedly stand intact, even after all the floors and the roof had fallen in, and they could be used again in rebuilding. The system has the merit of cheapness and ease of application, and is patented in this country. We have little confidence, however, in iron columns under the conditions incident to a great fire, and the sooner their use is prohibited by law the better it will be for the public.—*Firemen's Journal.*

A Will and a Way to Execute.

We are in receipt of THE CANADA LUMBERMAN, now transferred to the proprietorship of Toker & Co., and published semi-monthly at Peterborough, Ont. As its title indicates, it is devoted to the lumber and timber interests of the Dominion, and promises to advocate all measures tending to the advantage of the trade it represents, and to furnish full and reliable reports upon the co ndition of the Canadian market, statistics, etc. Its introductory is written as if there was a will and a way to execute behind the promises made, which must place the journal in full rank with others of its kind.—*New York Real Estate Record.*

BURLINGTON, VT., INSPECTION.

Although doing a large business in lumber the extensive market of Burlington has no systematized method of inspection. Steps are, however, in progress looking to that end, and probably before long rules and regulations regarding inspection will be adopted by the dealers in that section. While each lumberman now has an inspector of his own, a variety of customs prevail, notwithstanding an endeavor on the part of all toward uniformity.

The grades recognized in the Burlington market are as follows: Selects, Shelving, Second Shelving, Pickings, Shippers, Box, and Mill Culls.

These gradings apply to wide lumber from eight inches and upward.

Strips twelve feet long and upward are classed as 1st Quality, 2nd Quality, 3rd Quality and Box.

Under twelve feet in length the classes of seconds and thirds are combined as one, while all unfit for this grade go into a still lower grade of 3rd Quality or into a new grade of Box.

Spruce is divided into three grades, namely: Clear, No. 1 and No. 2.

Selects. Comprise the finer grades of lumber, and include all fair widths approaching to the upper grades of other markets, and suited to all the finer finishing purposes, for which the timber is adapted.

Shelving. Includes ten, twelve and fourteen-inch stock, and is classed as first and second shelving, as to relative quality and adaptability to the purpose indicated; first quality ranks about seven dollars per thousand below selects, while the second quality is from five to seven dollars below the first. In both qualities more or less knots and sap will be allowed, not affecting the board for the purpose from which it derives its name.

Pickings. A grade of lumber of any width, suited to one side finishing, embracing sap boards, and generally such lumber as while from width not fitted for shelving, is more defective than selects, yet filling a position which must otherwise be occupied by selects. As in other markets, it may be called the cream of the common. It is relatively in price about twelve dollars below selects.

Shippers. Are of diversified widths, without shake or case knots, and free from large coarse knots, comprising the best of the common after the picks are removed.

Box. Comprises a grade poorer than shippers, yet taking the run of the common, in all fairly sound and merchantable lumber. In price it is from two to three dollars below shippers.

The grades of shelving (first and second) Pickings, Shippers and Box are, one and all, selections from Common, made with reference to adaptability to the uses indicated by their designations.

Mill Culls. Are the poorest grade of lumber adapted to any utility, or recognised as merchantable, and bear the same description as the same grace in other markets.—*Lumberman's Hand-Book.*

AVERAGE WEIGHTS OF LUMBER.

The following table shows the average obtained in the actual shipment from Chicago of 20,000,000 feet of pine lumber, during an entire season:

	Pounds.
1, 1¼ and 1½-inch surfaced 1 side	2,102
The same, surfaced 2 sides	2,068
2-inch surfaced 1 side	2,200
White pine flooring, dressed and matched	1,890
Hard pine flooring	2,366
Ship lap, 8-inch	1,711
Ship lap, 10-inch	1,725
Ship lap, 12-inch	1,855
White pine, ⅝-inch ceiling	786
Hard pine, ⅝-inch ceiling	950
Siding	865
Piece stuff, rough	2,560
Piece stuff, surfaced one side and one edge	2,210
Thin clear, surfaced one side	1,380
⅝ ceiling	1,120
Rough boards	2,524
Hard pine fencing	2,910
4-inch flooring, dressed and matched	1,793
6-inch fencing	2,433
Pine shingles	248
Cedar shingles	203
Dry lath	502

LUMBERING IN MANITOBA.

The Emerson *International* of March 25th, says that James Carney, of Carney & Watson, visited the firm's logging camp up the river, near Acton, last Friday, and returned home on Monday, accompanied by his partner, Mr. Watson, who has gone to Winnipeg on business. Things are reported as booming at the camp, and a large number of oak logs are being got out. The firm expect their saw mill machinery about the 15th or 20th of April, and will rush the erection of the mill so as to commence sawing early in the season. The firm expects to handle half a million feet of logs and 30,000 feet of piles during the coming season. They propose to do their share in helping along the Emerson business boom. The boys are enterprising, and deserve to do well in their saw mill enterprise—as no doubt they will, as the farmers of Southern Manitoba have scarcely yet begun to provide themselves with comfortable barns and granaries, and will require an immense amount of lumber of the class that the Emerson steam saw mill will turn out, to say nothing of the demand for oak timber which will be made by various municipalities for bridges and culverts. By the time that trade has been satisfied the Red Lake Indian Reserve will have been opened up, and Messrs. Carney & Watson can then turn their attention to pine lumber, the logs for which will be brought down the Red Lake and Red Rivers. Emerson will then not only support one mill, but a dozen. Messrs. Carney & Watson's mill will be located on the river bank north of Park street.

THE SHIP BUILDING SEASON.

Owing to several causes, the season for ship-building has not opened with as good promise as ship-builders anticipated it would last fall. Freights at present are so low that there is little encouragement to builders to commence building yards, and if there is not an advance soon, most of the yards which are busy now will remain idle after the vessels at present building are got off. Ship timber is very dear also, and there seems to be no prospect of a fall in price, owing, it is said, to the scarceness of it. The scarceness was caused by many men who formerly were engaged in getting out ship timber going into the woods to get out logs, in view of the unusual activity in that branch of business.—*St. John, N.B., Globe.*

Hudson's Bay as a Possible Outlet for the North-west.

During the past summer the engineers of the Nelson River Railway Company have surveyed a railway route between Norway House at the outlet of Lake Winnipeg and Fort Churchill on the Hudson's Bay. The distance between these places is about three hundred and fifty miles. The surveyed route first follows the course of the Nelson River for a distance of nearly one hundred miles over a level country. The next part of the road is over a broken rocky country, where the Nelson River has a descent of nearly seven hundred feet to the lower plateau, where the country again becomes level, and continues so to Hudson's Bay. Upon entering this rocky range the surveyed route leaves the Nelson River, taking a more northerly course toward the valley of the Churchill River, which is reached at its entrance on the lower plateau, and continues to follow the course of the river to its outlet in Hudson's Bay. The estimated cost for building the road-bed is ten thousand dollars a mile on the plateau and seventeen thousand a mile through the rocky portion of the route, or an average of twelve thousand dollars per mile along the whole route.

It is claimed that by this route it will be possible to transport grain from the Saskatchewan Valley to Liverpool for less than it will cost to carry it to Montreal by the proposed railway north of Lake Superior.

Professor Bell, of the Canadian Geological Survey, who sailed from Fort York, Hudson's Bay, and passed through Hudson's Straits in the latter part of last September, says that sailing vessels have sometimes considerable difficulty and delay in getting through, but steamships can make the voyage at any time between the first of May and November, as the straits are nearly one hundred miles wide in the narrowest part, and the channel is not obstructed by ice.

Travelling Agent.

MR. A. L. W. BEGG has been appointed agent for the CANADA LUMBERMAN, and is authorized to collect subscriptions and grant receipts therefor and to make contracts for advertisements appearing in its columns.

The Canada Lumberman

DEVOTED TO THE LUMBER AND TIMBER INTERESTS OF THE DOMINION.

PUBLISHED SEMI-MONTHLY BY

TOKER & Co. PETERBOROUGH.

Terms of Subscription:

One copy, one year, in advance	$2 00
One copy, six months, in advance	1 00

Advertising Rates:

Per line, for one year	$0 90
Per line, for six months	50
Per line, for three months	30
Per line, for first insertion	10
Per line, for each subsequent insertion to 3 mo's.	05
Cards not occupying more than 12 lines (1 inch) per annum	8 00
Cards not occupying more than 12 lines (1 inch) for six months	5 00
Cards not occupying more than 6 lines per annum	5 00
Cards not occupying more than 6 lines, for 6 mo's	3 00

Special rates will be made for page, half page and column advertisements.

Advertisements intended for insertion in any particular issue should reach the office of publication at least three clear days before the day of publication, to insure insertion.

All communications, orders and remittances should be addressed and made payable to TOKER & Co., Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

PETERBOROUGH, Ont. APRIL 15, 1881

WE received a special dispatch from Ottawa, dated the 11th instant, which says that McEbymort's sawmill is in operation with a gang of 75 men. This is the first opening of the season. Reports from tne Upper Gatineau state that there are several feet of snow in the bush yet. The water is very low, and unless there are heavy rains within two weeks a great deal of pine timber will be stuck.

THE *Northwest Lumberman* says: The late opening of the season that the indications now promise will have a tendency to make business, when it does begin, very active. The mills will have to work hard to get out what they intend to manufacture, and the dealers will be equally busy receiving it, piling it up and selling it. The trade that has keen kept back by the embargo on transportation will probably be heard from in the shape of plentiful orders when the blockade is raised, and this business added to that which may ordinarily be expected in the spring, will, no doubt, make the neighborhood of a lumber yard a lively place, in the course of two or three weeks. The prospect, altogether, is that a good business will be done as soon as it is possible to do it, and when it does come, the activity of trade will, no doubt, make up, in a great measure, for the enforced dullness of the earlier months of the year.

A CORRESPONDENT informs us that the wealthy and energetic firm of Messrs. Thomas Cundle & Co. are making preparations to start their sawmill situated on the extensive limits recently acquired by them on Cockburns' Island, Lake Huron. These limits extend over 130 square miles, equal to about 150,000 acres, and are covered with a large quantity of pine, hemlock and cedar timber, which, if the logs at present in their boom may be taken as a fair sample, is of a very superior quality and which will, if properly manufactured, make A 1. lumber. The pine is thin in the bark and singularly free from sap, while the cedar is said to be long enough to scaffold a church tower, and sufficient in quantity to fence Lake Huron. Being situated as they are on the direct line of steamboat travel between Chicago, Collingwood and the Welland Canal we are not surprised to learn that some of our American cousins are casting a longing eye after them. We hope however that if Messrs. Cundle & Co. do part with them they will fall into Canadian and not American hands.

A LUMBERMEN'S ASSOCIATION.

We have had several suggestions made to us by lumbermen, as to the expediency of regularly organizing a Lumbermen's Association, and have been urged to write in support of it. There can, we think, be little doubt that such an organization would be of great assistance and benefit to the trade. In fact the expediency and even the necessity of organizing has already been fully recognised, and has been acted upon. Not long ago the Ontario lumbermen met together to discuss questions of interest to them, and by means of a regularly appointed deputation called the attention of the Provincial Government to certain requirements of the trade. On that occasion they were successful in obtaining the concession of several important points, which would probably not have been so readily yielded to their individual and separate solicitation. So too the Quebec lumbermen last month collectively addressed the Administration of their Province, with some immediate good results and the promise of more. But in these cases the organization was only temporary, being allowed to lapse into disuetude as soon as the immediate emergency was over, only to be renewed again under the influence of some pressing necessity. But this implies a great waste of time and energy with the minimum of advansage. If there were a permanently constituted association, it would always be prepared for consultation and action whenever, expedient, without waiting till some grievance became intollerable. In many other ways too besides dealing with the Government such an organization would be found useful by the trade. They are in fact so obvious that we need hardly point them out.

It has been suggested to us that an appropriate form for the organization would be in the shape of local associations with their committees and secretary to be established at the different lumbering centres, such, as regards Ontario, as the Ottawa Valley, the Bay of Quinte, the Georgian Bay and Peterborough. These local bodies would have charge of the local interests, and would also unite in a Provincial association to deal with general questions.

The farmers, the dairymen, and many other industries find it expedient and useful thus to bind themselves together for common action and mutual consultation, so it seems very natural to assume that the great lumber and timber industry would benefit at least equally by adopting a similar course.

We hope that some of our readers, who are interested in this matter, will give their views of the best means of arriving at this result. We will gladly find space in our columns for a discussion of the subject.

A FOREST COMMISSION.
